INDEX

TO THE SEVENTH VOLUME OF THE NEW ENGLAND FARMER.

- A. B., his quere on engrafting grape vines, 34.
 Abbot, Dr Abiel, extract from his letters, 339.
 Abbot, John, his remarks on the Fulton pear, 386.
 Acorns, uses of, 37.
 Address by William E. Richmond, extracts from, 36.
 — by Joseph L. Tillinghast, 105—of Samuel Breck, 172—by Myron Hotely, Esq. 260, 268, 276, 284—by George N. Briggs, Esq. 356, 364—by Col. Pickering 396, 404.
 A. E. on improved breeds of cattle, 129—on premiums for stock, 129.
 Agricola, on the rheum palmatum, or pie plant, 11—on geology for schools, 214—on broad wheels, 226.
 Agricultural Memoranda, 22—Schools established in Europe, 210.
 Agricultural Society, Massachusetts, list of its officers, 6—rules and regulations of their cattle show, 94—their show at Brighton, 102, 110—premiums granted by, 102—Committees of, 105—report of, on agricultural inventions, 105—on fat cattle, 106—on agricultural experiments, 106, 206—on working oxen, 114—on sheep, 114—on cows and heifers, 122.
 — of Essex, cattle show, &c. 86, 323—officers of, 89—report of committee of, 249—remarks on said report, 265—extracts from a pamphlet by, 412.
 — of Worcester, 98, 101—officers of, 333.
 — of Middlesex, 99.
 — of Cheshire, 101.
 — of Hartford, 107.
 — of Rockingham, N. H., 110.
 — of Bristol county, Mass., 118, 338.
 — of Hampshire, Hampden and Franklin, 124.
 — of Rhode Island, 126, 309.
 — of Merrimack county, N. H., 130, 331.
 — of Plymouth county, 140.
 — of Washington, Penn., 147.
 — of Philadelphia, officers of, 219.
 — of Waldo, Me., 341.
 Agricultural Societies, Gov. Lincoln's remarks on, 211.
 Agricultural and geological surveys recommended, 222.
 Agricultural School, proposed at South Hadley, Mass., 366.
 Agriculture, advantages to be derived from, 54—Flemish, notices of, 57, 212—in Nova Scotia, 148, 154—article on, by the Editor, 178, 185, 193—Board of, in North Carolina, 219.
 Agriculturist, an, on the culture of silk, 237.
 Air, course of, how ascertained, 272.
 A. K., his remarks and queries on cultivating forest trees, 138.
 Alcohol, quantity of, in different liquors, 403.
 Almanack, New England Farmer's, directions from, for the month of May, 342.
 Almonds, bitter, alleviate the evils of drunkenness, 40.
 Amateur, on the cultivation of plums, 22.
 Animals, domestic, changes in, when transported to America, 237.
 Anthracite coal, formation of, 83.
 Apoplexy, classes of, 13—blood letting recommended for, 58—from white lead, 101.
 Apples, on their preservation, uses, &c. 44—notice of large ones, 86—of double ones, 111—kept in grain, 236—and pomace, as food for stock, 274—different sorts of, in possession of J. Buel, Esq., preserved in dry sand, 407.
 Apple Jelly, recipe for making, 45.
 Apple trees, query concerning, 273—how treated by David Gray, 412.
 Arable ground, in large lots, 91.
 Armistead, W. R., on engrafting grape vines, 329.
 Arrachaca, vain attempts to cultivate, 243.
 Asparagus, improved by irrigation, 127—early specimens of, 254—on cultivating, in single rows, 406.
 Ashes, as manure, &c. 61.
 Ass, remarkable instance of instinct in, 48.
 B., his remedy against canker-worms, 12—his query on woodlands, 367—on gypsum, sources of moisture in soils, &c. 221.
 Backlog, hollow iron, filled with water, 189.
 Bacon, how cured in Virginia, 251—on preserving, 378.
 Baldness, remedy for, 171.
 Baking up houses, best mode of, 70.
 Bark-louse, or Coccus, remarks on, by Dr Harris, 289.
 Barley, Mr Parson's note on, 177—Dr Bradford's remarks on 177.
 Barley, pearl, a substitute for rice, 101.
 Barstow, John, his query respecting diseased sheep, 267, 313—on ruta бага, raised on new land, &c. 267.
 Bartlett, L., on insects on fruit trees, &c. 202.
 Bathing, warm recommended, 37.
 Baylies, Alfred, his Address to the Bristol County Agricultural Society, 325.
 Beal, David, his cultivation of lucerne, 62.
 Bean, great increase of, 234—winter, notices of, 394, 395.
 Beach tree, said never to be struck with lightning, 171—uses of, 182.
 Bee Miller, methods of destroying, 14, 45, 234.
 Beer, excellent, how made, 407.
 Beer barrels, floating lids recommended for, 104.
 Bees, accident by, 58—preserved against insects by salt, 81—essay on, 114, 133, 141, 149—management of, 230—Dr Thatcher's treatise on, 302—remarks on, by Medicus, 345—great increase of, 348—procure pollen in March, 361, 380—cruel custom of, 394.
 Beet, on its cultivation, 250, 261—disease in, 292—on making sugar from, 12, 285, 346, 362.
 Bell, Benjamin, on the use of India rubber for pruning and grafting, 313.
 Bene plant, uses of, 45.
 Birch tree, notices of, 131.
 Birds that destroy insects, 1—how scared from garden crops, 119.
 Birnie, C., on hedges, 53.
 Bison, notices and inquiries concerning, 361.
 Blackberries, alcohol procured from, 255—cultivation of, recommended, 351.
 Black-dying, remarks on, 132.
 Blacking for leather, 380.
 Bleaching flax, notice of a patent for, 247.
 Bleeding at the nose, remedy for, 247.
 Blight in fruit-trees, remarks on, 19.
 Bones of soldiers at Waterloo, uses made of, 141.
 Borer in apple trees, how extirpated, 46, 354.
 Boscavaine, on a horse's age, 35.
 Botanic garden, at Cambridge, report on, 26.
 Botts in horses, said to be cured by giving them unslacked lime 23—salt said to be a remedy for 74—recipe for, 299—notice of, by Professor Eaton 324.
 Boylston, J. L., Esq., great crops by 134—on the cultivation of Indian corn, &c. 225—fine stock raised by 401.
 Bradford, Dr, his remarks on barley 177.
 Brains, loss of not fatal 40.
 Brakes, how destroyed 14.
 Bread, brown, remarks on making 379—and milk, recommended for children 64.
 Breck, Samuel, Esq., extracts from his address on the death of Judge Peters 172.
 Briar, Mohawk, a remedy for sores 6.
 Briggs, L. W. on different sorts of locust trees 81.
 Broccoli, Cape, how raised in England 73.
 Bronchotomy, operation of 141.
 Brunswick, on cultivating silk in Maine 382.
 Budding stone fruit 217.
 Buel, Jesse, Esq., on the horticulture of the U. S. 108—on fire blight in fruit trees 137, 169—on forest and ornamental trees 147, 234—on insects on fruit trees 169, 263—on the uses of gypsum 188—on forcing rhubarb 285—on the propagation of fruits 305—on the climate of the United States compared with that of Great Britain 316—on planting timber, cultivation of sugar-maple and live fences 324.
 Bull, E. W., on a native grape 409.
 Burns, spirits of turpentine recommended for 58—linseed oil and lime-water, for 72—dredging them with flour 131, 299—tar said to be a remedy for 224.
 Burying grounds of a people 19 inches in length 16.
 Butchers' meat, market for in Ghent, how kept clean 28.
 Butter, by whom invented, and from what animals produced 3—how preserved in Turkey 29—how made in winter 69, 222, 395—how purified when rancid, 71—premium for to Mr Boylston 109.
 Buttons, manufacture of 161.
 C. his observations on haymaking, 1—on staggers in swine, 1—on the Massachusetts Horticultural Society, 278.
 Cabbage, preservation of, 155—how obtained early, 341.
 Caledonian Horticultural Society, deputation of, their proceedings, 212.
 Caldwell, J. A., his remarks on broad wheels, 274.
 Calves, remarkably large, 37, 78, 82, 155, 327, 401, 410—best mode of fattening, 181—scouring in, 238.
 Canals and rail roads in the United States, 69—in Ohio, 231.
 Cancer, recipes for, 5, 407.
 Candles, improvement in, 171, 181, 283.
 Canker worm, remarks on by Mr. Lowell, 2—supposed remedy for, 5—taring fruit trees to preserve against, 25—on destroying by burning straw, &c. 41—Mr. Houghton's remedy for, 94—another by B., 129.
 Canine madness, remarks on, 292.
 Capiaumont pear, notices and cut of, 409.
 Capron, Joseph W., his queries on grass seeds, 350—on cultivating the quince tree, 361.
 Carol, James, on preserving Indian corn from the weevil, 205.
 Carrots, juice of, used in making butter in winter, 23—on their cultivation, 347.
 Casks, foul and musty, how purified, 329.
 Castor oil, how made, 6, 291.
 Caterpillars, modes of destroying, 213, 230, 310, 355, 413.
 Catnip poultice, how made, and use of it.
 Cattle, improved breeds of, 129, 388, 389—premiums for, remarks on, 129—large and premiums for by J. H. Boylston, Esq. 166—North Devon recommended, 171—economy in feeding, 173, 206—horn all in, how cured, 194, 234—on changing from poor to fertile soils, 202—hoven or swollen, remedies for, 48, 510—should have water in their yards, 65—query respecting frozen feet, 267—remarks on stall feeding, 281—queries respecting food for, 293—on the loss of cud in, 337, 353—fine imported into Bennington, Vt., 389—valuable breeds of, owned by J. Prince, Esq. 394.
 Cattle market, English, notices of, 100.
 Caution, his remarks on rural economy, 266.
 Cedars, transplanting of, 395—recommended for hedges, 206.
 Charcoal dust, a top dressing of, for onions, &c. 354.
 Cheese, how preserved against mites, 59, 414—how made with seeds in Switzerland, 229, 238—directions for making, 358.
 Chesnut trees, notices of large ones, 36, 230—on their cultivation, 138—bark useful in tanning, 85.
 Chicory, on its extirpation, 38.
 Children, shoes for should be made large, 80—should not be rocked, 315.
 Chloride of lime, uses of, 402.
 Cider, on making, 4, 123, 182—best vessels for, 119—remarks on making, by a physician, 145.
 Cider brandy, ruinous to farmers, 253.
 Cider mill grater, notice of, 65.
 Cinnamon, fields of, 80—management of, 230—raised in France, 255.
 Circulation of sap in trees, remarks on 369.
 City and country, dependence of the former on the latter 258.
 Clergymen, industrious, notices of 366.
 Climate and silk, remarks on by J. M. G. 252.
 Climate of the Middle States, compared with that of Great Britain, by J. Buel, Esq. 316.
 Clover, green salted, quere concerning, 14—flesh colored, notice of 388.
 Coal gas, experiments in burning 344.
 Coal, Lehigh, dust of mixed with clay and burnt 218.
 Coal fire, how kindled 165.
 Coal mine, Worcester, notice of 59, 151.
 Cochineal introduced into Spain 49.
 Cocks singing, notice of 88.
 Cockroaches, how to destroy 3, 6, 21.
 Coffee, how first obtained in the West Indies, 24—notices of, 182.
 Coffin, R. A., queries proposed by, 329.
 Colds, on the prevention of, 86.
 Combustion of the human body, 80.
 Cookery, domestic, spirituous liquors should not be used in, 151.
 Cordage, new material for, 383.
 Corn husks for beds, 127—for making paper, 293.
 Corns in horses' feet, remarks on, 340.
 Correspondent, a new, on disease in fruit trees, 133.
 Cottages, English, notices of, 5.
 Cotton raised in Salem, Mass., 109.
 Cowing, Cornelius, his cultivation of turnip rooted cabbage, 62.
 Cows, to prevent their contracting bad habits, 30—on their going dry too soon, 31—how they should be kept, 31—useful in teams, 38—good food for, 54—marks of a good one, 56—on the management of, 162, 176—more

- easily fattened and better laborers than oxen, 262—of Lapland, notice of, 285—garget in, 302—preserved against flies, by oiling the parts most exposed, 348—notice of a remarkable one, 386, 410.
- Coxe, Wm., on engrafting vines, 34.
- Crimp, how to prevent, 41.
- Cranberries, profitable produce of, 141.
- Croup, valuable remedy for, 96.
- Crows, useful in destroying vermin, 328.
- Cucumbers, how rendered wholesome, 38—large one, 48, 80—Girkin, how pickled, 55—remarkable cluster of, 78—how obtained early, 230—analysis of, 251.
- Cultivation, thorough, advantages of 167.
- Cultivator, his remarks on the circulation of sap in trees, &c. 369.
- Curculio, an insect in fruit trees, notices of, 81, 82.
- Curtis, Samuel, on destroying insects by lime, 338.
- Dahlia, a flower, how forced, 236—on its cultivation, 387.
- Dairies, Dutch, notice of, 63—should be kept sweet, clean, &c. 97.
- Dairy, a valuable, 133.
- Dandelions, transplanting and cultivating, 350—large, notice of, 383.
- Dearborn, Gen. H. A. S., his notice of Mr. Lowell's offer to furnish buds to Mass. Horticultural Society, 401.
- Death, on the dread of, 8.
- Denim, Harvey, his query respecting the weevil, 62.
- D. F. on insects on fruit trees, 203, 217—his remarks on pear trees, 273.
- Diet, power of habit in, 46—vegetable recommended, 124.
- Dogs, Esquimaux, their uses, 214.
- Dorchester, on stacking hay, 17.
- Downer, S. his remarks on native pears, 266—on native grapes, 282—on queen bees, curculio, and apple tree borer, 290—on the Epargne pear, 313—on the Fulton pear, 386.
- Drains, different sorts of, &c. 52.
- Dram shops, remarks on, 224.
- Drawings of horses, recommended by a breeder, 267.
- Drill husbandry, not proper for some crops, 166.
- Drowned persons, how recovered, 101.
- Drunkenness, evils of, 88.
- Dysentery, avoided by the use of pepper and spices, 4—cured by boiled milk, &c. 39—high mallows a cure for, 72.
- E. on destroying canker worms, 41—on smut in Indian corn, 41.
- Earthquakes, cause of, 52.
- Eaton, Professor, on the bott fly, 324.
- Economy, domestic, principles in, 29, 349, 408—on constructing a parlor and kitchen, according to principles of, 246.
- Eels, how roasted, 38.
- Effluvia of rotten substances, a source of disease, 213.
- Eggs, preservation of 191, 219.
- E. H. his present of fine fruit from a graft of a tree introduced one hundred and seventy years since, 82.
- Elderberry wine, how made, 65—do. syrup, 78.
- Electrified seeds and plants, rapid growth of, 51.
- Elm tree, extraordinary growth of, 299.
- Elwyn, J. L. on the age and founder of horses, 181.
- Entomology, contributions to, by Dr Harris 90, 117, 122, 132, 156, 164—ills of ignorance in, 97, 171—study of, inexhaustible 182.
- Essex, his remarks on the report of the Essex Agricultural Society 265, 291.
- Evaporation, notice of experiments in 221.
- F., his notice of insectivorous birds 2.
- Farm-buildings, rules for their construction 65, 69.
- Farmer, R. L., on composition of soils 491.
- Farmer, an old, his hints to young farmers 213—on potatoes 393.
- Farmer, a young, his queries respecting frozen feet in cattle 367.
- Farmer, a, on potatoes as food for milk-cows, &c. 10—on destroying thistles 17—on pruning grape vines, 329—on cultivating potatoes, 363.
- Farmer, a Roxbury, his extracts and remarks 113—on new varieties of potatoes 257—on orchards 273—query of, respecting apple trees, 273—on the supposed degeneracy of potatoes by intermixture 298.
- Farmers' Winter evenings, how they should be spent 17—importance of knowledge to 52—work for June 374.
- Farmer's young, hints to 213—his pursuits compared with those of merchants 379.
- Farmer's sons, advice to 357.
- Farming, axioms in, by Dr Cooper 14—embraces a variety of objects, &c. 196—Plough Jogger's remarks on 341.
- Farms, small, advantages of 195.
- Female attire, remarks on 392.
- Fences, remarks on 318—not wanted for arable ground, 349.
- Filberts may be grown in the United States, 380.
- Figs, on the management of 73.
- Fire blanket, notice of 358.
- Fire blight in fruit trees 137.
- Fire places, remarks on 166.
- Fire wood, economy in 207.
- Fish, how to convey them alive to a distance 83—value of, taken by fishermen of Massachusetts 116—re-animation of when frozen 411.
- Fiske, Dr O., his remarks on staggers in swine, 99—on planting horse chestnuts 102—on smut in Indian corn 113—on applying manure to Indian corn 113—on diseased pear trees 358.
- Flax, preparation of 414.
- Flemish husbandry, notices of 57.
- Flood in Connecticut river 75.
- Flooding of lands, remarks on 181.
- Flour sent from Michigan to Boston 33—qualities of, how ascertained 341.
- Flower of Sumatra 56.
- Floy, Michael, on Bishop's early dwarf pea 285.
- Fly-water, made of strong soucheong tea 128.
- Food, remarks on 4—for plants 182.
- Forest trees, queries respecting, by A. K. 137—on their cultivation 138, 146—their cultivation in France 145—Mr Buel's remarks on 147—seeds of, when sown 147—in Switzerland 238—on transplanting large 387.
- Fowls, feeding and fattening of 191.
- F. P. on sowing mulberry seed 322.
- Franklin, on Farmers' Winter Evenings, Lyceum, &c. 17—on the employment of time 25.
- French plants, notice of 409.
- Frost work, damage done by 211.
- Fruit, on raising new varieties of 28, 210—stealing of, punished 52—not unhealthy, if properly used, in warm weather 58—fallen, should be gathered and given to swine 63—new kinds from Mr Buel 89—notice of kinds near Boston 217—improvement of, in Belgium 229.
- Fruit trees, carelessness in selling wrong sorts of 6—on blight in 19, 137—best time to inoculate or bud 23—best method of tarring to preserve against canker worms 25—insects on 33, 82, 142, 158, 202, 217—remarks on their cultivation 67—young should not be permitted to bear for some years 70—best methods of transplanting 73, 197—some sorts of, said to flourish on morass 123—how preserved against mice 136—disease in 153—proper stocks for, securing against worms, &c. 195—use of sand in propagating 202—query relative to budding on 203—remarks on budding 217—on their selection 225—remarks on, by a subscriber 241—queries on 257—on the propagation of, by pollen or farina 305—remarks on planting 325—on destroying insects on, by a lime-duster 338—yellows in, supposed to be caused by the Lombardy Poplar 340—cultivation of, taught in Germany 351—schedule of presented by William Prince & Sons to Massachusetts Horticultural Society 385—on obtaining uniformity in the names of 406.
- Fruit Jelly, new mode of making, 71.
- Fruit Ladder, how constructed, 78.
- Fuel, most healthy, &c. remarks on 86.
- Gardeners, important hints to 411.
- Gardener's work for September 77—for January 198—for February 235—for May 339—for June 374—for July 398.
- Gardening, remarks on 38, 257—profits of 70.
- Garden, Lord Chatham's, notices of 195.
- Gardens valuable for Farmers 70—cultivated with a plough 70—about London, notices of 88—in town, how they should be managed 123.
- , kitchen, on their importance, &c. 261—general remarks on their culture 261—and orchards, Societies to prevent depredations in 394.
- Garlic, an antidote against fall fever 14.
- G. B. J. on preserving plums from worms, and grapes from mildew 34.
- Geese, fed on cut turnips 43.
- Geology, sketches of 68—recommended for schools 214.
- Ginger root, raised in Georgia, 186.
- G. J. M. on the quality of hay, &c. 41.
- Gimbrede, Professor, on the culture of the native grape 172.
- Girkin cucumber, how pickled 55—seeds of should be forced in a hot bed 55.
- Gold mines in the United States 91—in North Carolina 115.
- Gold region of North Carolina, remarks on 380.
- Gold washings, uses of 189.
- Gooseberries, measuring 4 and a 1-2 inches 14—sorts of exhibited before the Caledonian Horticultural Society 237—on the improvement of, in Great Britain 317.
- Gougeon, J. M., on the cultivation of squashes, melons, &c. 345, 347.
- Grafting, remarks on, by Mr J. Welles 46—vines, at the root 66—phenomenon in 213—India rubber useful in 313—benefits of not fully realized 325—compositions for 337, 358—remarks on, by Mr Preston, 337—by J. W. C. 350.
- Grapes, how preserved 31—from mildew 34—Isabella, by Z. Cook 86—American, notice of, by Mr Davie 112—another sort of 125—Mr McCall's remarks on several kinds of 187—native, Mr Downer's remarks on 282—White Muscadine, notice of 293.
- Grape vines, on the cultivation of 12, 13, 314—native 172, 190—on a mode of pruning, which may cause foreign grapes to ripen in the open ground, 329—Mr Prince on engrafting 329—Mr Morrell on grafting 347—remarkable, raised by John Willis, Esq. 282—Muscadel 395.
- Grass Seed, on the sowing of 307, 322, 350.
- Grasses, British, quality of how ascertained, &c. 199.
- Grater Cider Mill, notice of 65.
- Grave yards, complaint of the neglect of 307.
- Gray, David, statement of the cultivation of his premium farm 412.
- Green, Dr B., his directions for budding stone fruit 217—on rose bugs and other insects 332.
- Groves, remarks on, 181.
- Guatemala, wretchedness of the people in 29.
- Gypsum, its uses, &c. 188, 204, 405—most beneficial when sown in winter or early in spring 224—on its power to absorb moisture from the air for the benefit of vegetation, &c. 221—discovery of, west of Lake Champlain, 332.
- H. on the destruction of silk worms by a spider 10—on burning dust of Lehigh coal 218.
- Halstead, Philemon, his remarks on several agricultural topics 49.
- Hair restorative, salt said to be 65.
- Ham, preserved by dipping in a strong ley 14—preserved in oats 97.
- Hand Engines, for extinguishing fire 173.
- Harris, Dr T. W., on slug worms 33—on an insect that destroys squashes, &c. 33—on the autumnal caterpillar 33—contributions to entomology 90, 117, 122, 132, 156, 164—his remarks on insects on fruit trees, 186—on the bark louse or coccus 289—on the American turnip butterfly 402.
- Hare, raising of, in warrens, &c. recommended 196.
- Harvesting grain, remarks on 370.
- Hawthorns, use of, for live fences 277.
- Hay, new mode of stacking, &c. 17—not of good quality the present season 41—new mode of making 42—three crops of 48—should not be kept in lofts over stables 97.
- Hay cocks, covered with canvas 1.
- Haymaking, remarks on 3.
- Hazel and holly as underwood, &c. 77.
- Hazen, Thomas, on the horn ail in cattle 234.
- H. B. on preserving peach trees against worms 2.
- Health, rules for preserving 96—preserved by quick lime, &c. 393.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

HAYING.

MR FESSENDEN—I read in the last Farmer some directions for mowing, from some of which, though sanctioned by general practice, I beg leave to enter my dissent. "The mower's work, you say, will not only be made easier by the coolness of the morning air; but also by the dew on the grass, which is cut the more easily for being wet."

I admit that the grass is cut with more ease when it is wet than in a dry state; but when the grass is wet, the ground is of course wet; and if the grass is thick and suffered to lie in the swarth it makes very imperfectly and slowly, and from its wetness is liable to lose its sweetness; as tea and all other herbs lose their sweetness or strength, by being steeped in water. Or if a person follows the mowers to spread the grass soon after it is cut, the ground upon which it lays is not soon dried; much care is requisite to separate all the wet locks; and to spread it completely; and much time and labor are employed without necessity; a matter of no small consideration in the busy season of haying. My own wish therefore is never to cut my hay but when it is perfectly dry, and the ground not only dry but warm; it has then the advantage not only of the direct rays of the sun but of the reflected heat from the ground. Like weeds cut down in a corn field when the sun is clear and warm, it wilts at once; it requires very little tossing about or as the English call it, tedding, and it retains its sweetness. So far then it is a very great saving of labor and a gain of time and of quality in the hay.

I am always anxious likewise to have my hay put in cock at night though it may have been mowed very late in the day, and be quite green; provided only, it is not wet. Wetness upon hay, from dew or rain, is always in a degree injurious; it hurts its sweetness; but the moisture arising from the natural heat of the hay, is not prejudicial; but serves on the contrary, to forward the making of the hay, unless it is permitted to continue too long, or the heaps when in a green state are made too large. It must not be suffered, if I may use the expression, to go on to the acetous fermentation. The best farmers, I believe, agree that clover-hay should be stirred no more than is indispensable, in order to save it—because of the loss of its most nutritious parts, the leaves and flowers. By putting my hay in cock at night, I have the farther advantage of finding the ground round it dry and warm early in the morning, which is of great importance to the expeditious making of the hay. Clover is always much better for being cured in part by salting. An old experienced farmer in my neighborhood, maintains, that it is so with all hay; and he told me a few days since, that he considered the cost of a bushel of salt to every load of hay he put in his barn saved in his being able to house it so much sooner and of course with much less labor.

You will not understand me, Mr. Editor, as wishing to set up my own in opposition to your intelligence and experience. My remarks are

founded upon my own practice; I hope you will think that there is some reason in them; and if you please, you may submit them to the agricultural fraternity. C—.

Essex county, July 17, 1828.

P. S. Sometime since I passed a farm near Boston, which I was told belonged to a gentleman, who had been a ship-master; and found his hay cocks at night covered with pieces of canvas, probably parts of an old sail, of a suitable size, painted with a coarse red paint and having weights in the corners to keep them down. They could have cost but little; if taken care of would last for years; could be thrown upon the hay with very little trouble; and fifty or a hundred of them on a small farm in such a capricious, or as the farmers say, catching season as this, would have proved of a utility much outweighing the expense.

FOR THE NEW ENGLAND FARMER.

STAGGERS IN SWINE.

MR. FESSENDEN.—Within the last two years I have had six pigs of different ages attacked with a disorder, called the Staggers. Other persons in my neighborhood have likewise suffered, and that very severely in the loss of some large and valuable swine. The hog in this disorder is first observed to be continually turning himself round, or running from one part of the sty to the other; he soon becomes totally blind; refuses to eat, falls down and rolls upon his back in that which seems very painful and before long commonly dies.

I inquired of a celebrated Cattle Doctor in my neighborhood, a very useful and well meaning man, if he knew the disorder and what was the cause and remedy. He replied that he was often called to cases of this kind, and commonly lost half his patients; that in fact he was seldom successful. The cause of it, he said, to use his own expression, was pizum (poisoned) teeth, which might be known by being discolored. The only remedy he knew was first to insert his knife into the animal's neck just back of his ears up to the hilt and "drive in" a piece of garget root; then to cut a gash beginning between his ears down his forehead and clean into the bone and then with a punch to beat out the poisoned teeth as many as there might be. After such horrible cruelty as this, it was no longer matter of surprise to me that half his patients died; but that any of them survived; and I wondered much at what medical school such a gentleman could have received his diploma.

I myself at first lost two swine from entire ignorance as to what to do; but in one of the volumes of the Philadelphia Memoirs of Agriculture (the 1st, I think) I found a direction to cut off the tail and ears of the animal as the easiest way of bleeding him, and then to give him a strong dose of Castor Oil. I have followed these directions and have then immediately turned the sick hog out of the sty into the pasture, and in this way have succeeded in saving them. Sometimes they have relapsed but have been restored by being again turned out. They do not soon come to their appetite and the disease materially and for a length of time

injures their growth. The disorder likewise is said to be contagious and likely to go through the whole sty; but this has not been the case with my swine.

The cause of the disorder, is as yet, I believe, unknown. Some attribute it to their eating the liquor of meat which has been cured by saltpetre; others to a wet lodging; others to excessive feeding. Neither of these causes apply to my hogs; nor can it be the weather, as it has happened with me at various seasons. I have no doubt that a release from the confinement of the sty was of great service to the sick swine. Whatever may be the cause, it may be useful to give the result of my own experience, in a case where, certainly, interest and humanity are greatly concerned; and I should be happy to hear from your more experienced correspondents, what they know of the subject.

Respectively, yours,

July 17, 1828.

FOR THE NEW ENGLAND FARMER.

INSECTIVOROUS BIRDS.

MR FESSENDEN—I have noticed in your New England Farmer several accounts of the ravages of the canker worm this season. And I am inclined to believe this insect, as well as some others, has been more numerous in the county of Essex this season than for many years. Now, Mr Editor, we are told by many people, we must take our trees and do many other things to preserve our orchards from the ravages of the canker worm, which, after all, it avails but little. The canker increases in number yearly. But for my own part, I think, were we to leave off wantonly destroying our small singing birds, we should be less troubled with insects of all kinds. It is a fact well known to every naturalist, that small birds destroy an almost incredible number of noxious insects. The amiable and indefatigable ornithologist, ALEXANDER WILSON, who perhaps was better acquainted with the habits of our birds than any other person, when speaking of the *Sturnus Predatorius*, or red winged black bird, which, by the way, is by our farmers considered the most mischievous of birds, says "their food in spring and the early part of summer consists of grub-worms, caterpillars, and various other larvæ, the silent but deadly enemies of all vegetation, and whose secret and insidious attacks are more to be dreaded by the husbandman than the combined forces of the whole feathered tribes together for these vermin the black-birds search with great diligence; in the ground at the roots of plants, in orchards and meadows, as well as among buds, leaves and blossoms; and from their known voracity, the multitudes of these insects which they destroy must be immense.

Let me illustrate this by a short computation. If we suppose each bird, on an average to devour fifty of these larvæ in a day, (a very moderate allowance) a single pair in four months, the usual time such food is sought after, will consume upwards of twelve thousand. It is believed that not less than a million pairs of these birds are distributed over the whole extent of the United States in summer; whose food being nearly the same, would swell the amount of vermin destroyed to twelve thousand millions. But the number of young

birds may be fairly estimated at double that of their parents, and as these are constantly fed on larvæ for at least three weeks, making only the same allowance for them as the old ones, their share would amount to *four thousand two hundred millions*; making a grand total of *sixteen thousand two hundred millions* of noxious insects destroyed in the space of four months by this single species. The combined ravages of such a hideous host of vermin would be sufficient to spread famine and desolation over a wide extent of the richest and best cultivated country on earth.

All this, it may be said, is mere supposition. It is, however, supposition founded on known and acknowledged facts.

Mr. Bradley, in his General Treatise on Husbandry and Gardening, shows, "that a pair of sparrows, during the time they have their young ones to feed, destroy on an average, (every week) about *three thousand three hundred and sixty* caterpillars." This calculation he founded on actual observation. And it is well known that several kinds of our birds, such as the *hirundo*, *muscipapa* genera, and some others, feed entirely on insects.

I am fully persuaded, as long as farmers and others permit boys to roam over their fields and shoot down every small bird they meet—as long as young men are in the habit, on our anniversaries, of forming themselves into shooting parties, for the purpose of destroying small birds, which they do in immense numbers—I say as long as this wanton destruction of birds is carried on, we must expect innumerable hosts of noxious insects will continue to commit depredations on our orchards, our fields, and our gardens.

Yours, respectfully,

Danvers, July 18, 1828.

F—.

FOR THE NEW ENGLAND FARMER

THE VINE.

MR. PESSENDEN.—I last autumn addressed a request to some gentlemen who have extensive vineyards on the border of the Rhine in the most northern department (*Haut Rhin*) of France and requested them to send me 6000 grape vines, comprising only those which were cultivated with *the most ease and most success* in their vineyards, and which were, there, fully to be relied on for *abundant yield and regular crops*. I applied to these gentlemen from a full conviction of their knowledge on the subject, they having been most successful cultivators of the vine in that northern locality; and also because in a long intercourse I have never been deceived by them, but on the contrary most honorably dealt with. In consequence of this application, I received in April last 6400 vines, which arrived in perfect order and were planted at my establishment here, where those who are desirous can view them. But the object of most importance is the *selection of kinds* made by them and which consists of the following.

Auermas blanc
— gris
Facun or Bourger
Gros Rauschling
Petit Rauschling
Hinesch
Rothliehmer

It will be perceived that several of the above are German varieties, and it is a subject of gratulation that the two first enumerated, from which the celebrated Champagne wine is made, are found

to succeed so far north. From the particular circumstances under which this importation was made, I think the vines selected extremely well calculated to succeed as far north as we may reasonably expect vineyards to flourish in our country. I will merely further remark, that the great distance up the Rhine, where these were obtained, caused their land transportation through France, to amount to more than the original cost of the vines.

Yours, most respectfully,

WM. PRINCE.

Lindeman Botanic Garden, }
July 15, 1828. }

FOR THE NEW ENGLAND FARMER.

CANKER WORMS AND SLUG WORMS.

MR. PESSENDEN.—These two destructive insects have again appeared in great numbers—to the great annoyance of farmers and gardeners; but with their *return*, there does not seem to have been a correspondent *return* of good sense, and practical skill on the part of many of the sufferers. I think that you could not render a more acceptable service to the public, than by republishing in your journal (without the plates) the two treatises of the late Professor Peck, on the canker worm and slug worm. Before I proceed to make any remarks or remedies, I would observe, that though the times of the appearance of these most destructive insects, are not as well fixed, as those of the locust, which appears stately once in sixteen or seventeen years; and although I am aware, that no such law prevails, or governs the movements of the canker worm, and the slug worm, (having seen both in very small numbers during the whole interval since their last extensive ravages,) yet it is true, that the canker worm and the slug worm have appeared but twice within my memory in great force, and we have no reason to doubt, that we shall again enjoy a long interval of peace from their depredations.

Now as to remedies. I agree, cordially, with your Lynn correspondent, that in tarring we have the most effectual, and the most certain remedy. Yet it is a very expensive remedy as it respects labor—and if other means can be devised less troublesome and as effectual, it would be worth a premium of five hundred dollars from the State Legislature—I might say a thousand.

During the last visitation of the canker worm, about 17 or 18 years since, Mr. Josiah Knapp, of Boston, applied effete or slacked lime to the roots of his apple trees, which had been overrun the year before, and the insects disappeared. I published his letter in our journal, and tried the lime on the greater part of my trees, leaving some without the application. Every tree treated with lime was free from the insect—every tree not treated with lime, was infested with them.

Professor Peck observes, that the insects which rise in the fall and spring, rarely come from a greater distance than three or four feet from the stock—so that an application of lime to that distance would suffice.

I am not, however, confident on this subject—but I think it worthy of extensive experiment. A gentleman in Rhode Island has tried a circle of tin with success. An account of it was published in your paper. Will you invite him to give a specific description of the mode of application, and of the success? I have no doubt that a premium would be given to him if it should prove effectual.

As to the slug worm, I had no difficulty whatever in subduing it by shaking lime over the leaves

in the middle of the day. This was effected by suspending on a long pole an old sieve filled with lime, and shaking it over the whole tree. The slugs were entirely destroyed.

The sieve should be suspended by twine at least eighteen inches long, so as to admit of considerable motion to the sieve. If these suggestions shall be of any use, it will afford me the highest pleasure. It should be recollected, that the slugs will re-appear the last of August.

JOHN LOWELL.

Roxbury, July 22, 1828.

N. B. I am much pleased with the POTATO ONION, procured at the New England Farmer Seed Store—I had them of full size ten days since, and their quality as an esculent is equal to any.

[Extract from a letter to the Editor of the N. E. Farmer]

PEAR TREES.

"Have you any information of the existence of the disorder which prevailed for the two last years, and excited so much anxiety for the fate of the Pear trees? I have the satisfaction to observe that the cause, whatever it may have been, has ceased to operate in this vicinity. Our Pear trees look well, and although not remarkably fruitful, are thrifty, and throw out new wood in abundance."

Yours, W. J.

Plymouth, Mass. July 22, 1828.

From the American Farmer.

PRESERVATION OF PEACH TREES.

In your paper of the 6th of June, I observed one or two paragraphs upon the subject of the preservation of peach trees. If you esteem this luscious, and during its season incomparable fruit, as I do, you will not hesitate in rendering every aid towards its successful cultivation.

In addition to my orchard, I have about one hundred peach trees of different kinds, (and some one or two which are natives of our village, and of but few years, are equal to any,) not one of which is at all injured by the worm, while many of my neighbors' are entirely destroyed. I can assure every one, that from my experience, no difficulty exists, and the produce amply remunerates for every trouble. One of your correspondents recommends lamp or fish oil, and then boiling water. Both are right, although I should say that boiling water was a very doubtful remedy, and would require to be often repeated. Not long since I saw a very fine peach tree in a perfect state of preservation. Although it had been several years bearing, (it was in a small garden, the reason of there being no more) yet the worm had not injured it. Always anxious to learn every thing connected with agriculture, I inquired particularly with regard to its treatment, and was informed that the lady of the family had directed the suds of soap after washing, without regard to their being cold or boiling, to be thrown about the tree—and it had the desired effect.

The season is approaching when the insect commences its depredations. The season of its depredations may be fixed as commencing early in July, and ending in September. Its greatest ravages are during the month of August. It penetrates the surface, and commences its depredation by boring the tree and depositing its egg about one to three inches below the surface. I have read in works upon the subject, that the bark is there more tender, which I presume is an

error, and that all bark of the root is equally soft, and that it is only the natural instinct which causes the insect to commence at that place. The egg, thus lodged in the wood of the tree, is there hatched and becomes a worm, which feeds upon the tender wood and bark, and effectually destroys the tree. My method of prevention is this:

Early in the month of July, with a hoe I clean away the earth from about my trees, in size and in shape like a common wash bowl. The excavation being about three inches deep next the tree, and six or eight in diameter. I then fill up the hollow with common wood ashes, and raise an embankment about the tree, also about the size of a common wash basin inverted; and have never yet known the insect to penetrate this embankment of ashes to the injury of my trees. I have never discovered any injury to result from the caustic nature of the ashes, and always take the precaution in the fall, say October, to remove the ashes and mix them with the surrounding earth, drawing up fresh earth to the tree to supply the place of the ashes. If any of your correspondents to whom this process is unknown, should be induced to try this experiment and should succeed, if they are as fond of a basket of fine Old Mixtons as I am, they will be obliged to me; if unsuccessful, I shall not have given them much trouble.

I have heard and read of various remedies for preventing the injury spoken of, but do not believe that any of them will prove efficacious, except the application of some substance to the tree just below the surface, which will prevent the approach of the fly or insect. I have often thought that lime in its powdered state, would be more efficacious than ashes; but as the ashes have never failed me, I have never tried the experiment. I have known it recommended to remove the earth from the tree, so that the frosts might have full effect. This, however, will do no good, as the injury, or rather the seeds of it, are lodged in it before the frosts commence, and are not injured or destroyed by it. I have known the earth removed, and tobacco stems and other offal from the tobaccoists, applied with success. Ashes, however, are less trouble and more certain. In the summer I give my trees a thick coat of wash; a mixture of cow-dung, urine, soap-suds, ashes and lime. I do not know that it is of service in preventing the injury I speak of, but have often thought it did; preventing by its disagreeable nature, the approach of the fly to any part of the tree. It is of essential service to the general health of the tree by destroying worms and insects, which are prevented from depositing their eggs in the bark. If you think the above worthy a place in your columns, it is at your service.

Dayton, Ohio, June 24, 1828.

H. B.

From the Hampshire Gazette.

BUTTER.

Butter was not used for food by the ancient Jews, Greeks and Romans. The invention of this article is ascribed to those barbarous nations, the ancient Scythians, Germans and Britons, and from them the Greeks and Romans derived their first acquaintance with it, about the time of the Christian era. After learning its nature, they made use of it only as an ointment, and in medicine, and their agricultural writers take no notice of it.—The ancient butter appears to have been liquid, and was poured out like oil, and the Christians

sometimes burned it in their lamps at their altars. In our English translation of the Bible, the word butter is used in Genesis xviii. 8; Deut. xxii. 14; Judges v. 25; 2 Sam. xxii. 29; Job. xx. 17, and xxix. 6; Isaiah vii. 15; and Prov. xxx. 33.—Biblical critics agree that in all these passages, the Hebrew word translated butter signifies sour thick milk or cream.—The passage in Proverbs might have been translated "The pressing of the milk-er bringeth forth milk." Jahn says "anciently butter was not much used, but instead of it oil of olives. In the Bible there is no mention made of butter."—He remarks that what in some translations is rendered butter, was used as a drink, and must have been milk in some shape or other. At the present day, there is but little butter used in countries where the olive grows. Olive oil supplies its purposes. A late traveller in Italy, Rev. J. J. Blunt, says butter is not to be met with in those parts of Italy not much frequented by travellers, and in Sicily, he did not find it in a single place, excepting the cities of Palermo and Messina.

The cream of the milk of the goat, ewe, ass, buffalo, rein-deer, and cow yield butter; but "no length of churning," says the N. E. Encyclopedia, "will produce it from the cream of woman's milk, or of mare's milk."

The vessels used by the ancient barbarians in making butter, were not very different from modern churns. In the northern parts of Africa, in Egypt, and Arabia, they churn by putting the cream into a goat's skin, and pressing it to and fro. Sometimes they place it on an inclined plane, and keep it rolling from the top to the bottom. This method soon produces butter. An English traveller in Greece, observed them treading the goat skins filled with cream, with their feet. In Bengal, they churn by turning a stick in the milk, and in this way, families have fresh butter every morning.

Butter, it is said, may be got by agitating milk as drawn from the cow, in greater quantity than from the cream of the same milk. Even whey by churning yields butter. In Scotland, 14 gallons of whey are said to afford one pound of butter.

HAY MAKING.

As the season for making hay has arrived, I wish to say something upon what I have found, from experience, the best manner of saving it, because I consider one ton of good hay of as much value for feeding a stock of cattle, as two tons of poor.

It should be an invariable rule to cock up in the afternoon, all the grass which has been cut in the forenoon, and not open it again until the heat of a meridian sun has exhausted the dew and made the earth hot the next day, and then it need not be spread very thin. The best way is to turn the cocks directly over and loosen them a little, so that the sun and wind can penetrate through them, and then before the dew falls put them back in their original position. The next day the weather being good, serve it in the same manner, as soon as the dew is off, and you will find, after it has been open to the sun a short time, it will be sufficiently made to be taken into the barn, and that it has retained its original green color, looks nearly as bright as it was before mowing, has a rich perfume and will weigh more, as well as support more stock, and bring a better price in market.—It may be that a longer time will be necessary for curing clover, when mowed green and the crop

large. If that is true, the same mode must be pursued to have it good, at least it must be protected from the dew. Let clover once be soaked with a heavy dew, after it has been wilted by the sun, and it is of but little value; the leaves drop, change color, and are lost, the stock becomes brown and tasteless; indeed, it will hardly compensate the farmer for his labor of taking it to his barn; but secured from the dews and made by the wind and sun, it will be good hay, even a richness will be retained in the stacks, so that cattle or horses will consume the whole. In seasons of showers, you have the only security which is possible, by having your hay in cock, which, done as it ought to be, prevents it from receiving much damage; whereas showers upon hay, half made, and spread on the ground, nearly ruin it.

A small quantity of salt put on our hay, which is early cut, is of great utility; it preserves the hay and is healthful for the cattle.

Our soil is good for grazing; cattle and beef are one of our staple exports; that our stock should be well wintered is of great importance, because it is always easy to make good beef from cattle of any description, which have been well wintered, and are in good order in the spring. Every farmer, therefore, who wishes to make money by his business, cannot pay too much attention to have his hay good, and his stock well tended, for thereby wealth will come to him.

Should it be objected, that to make hay in this manner, the hay makers would be out of employ towards the close of the day, the answer is, that having secured what has been cut in the morning, the mowers may proceed to cut the grass, because it ceases to wilt after the dew-fall, and consequently is not injured by lying open on the ground having never been wilted by the sun.

Could we but learn to make our hay as it should be, and abuse our working oxen less; not make them work excessively hard all day, and, at the same time, be continually branding them with a sharp iron, because they can do no more than their strength permits, we should find many more dollars in the pockets of our farmers, and the value of our stock nearly doubled.—*Maine Patriot*.

How to clear a House of Cockroaches.—Messrs. Editors,—Having been greatly annoyed by the nocturnal visits of these insects which appear to be equally in want of food and clothing—some of my family applied a remedy which succeeded so well, that I am inclined to mention it for the benefit of those to whom it is not already known.—Into a common bowl was put a gill or two of water, and made sweet with molasses. As the family were about to retire, this was set upon the kitchen hearth under and about which seemed to be their favorite resort. Several splinters were placed, one end on the hearth, in order to provide a passage to the water. The first night about 20 were taken; the second, more than one hundred; the third, about fifty; the fourth, about twenty;—the fifth, seven; which, I believe has very nearly cleared my house of the nuisance. This remedy is so simple, and at the same time so effectual, that hereafter no family need be troubled with cockroaches, unless they choose.—*Col. Reg.*

[It might be well to add here, that this should serve as a caution against drinking water, or any liquid in the dark, as the same kind of weather, which makes people most thirsty, also makes insects the most plentiful and troublesome.]

HOG STY.

The ways of constructing these houses are various: But the best are those which are framed and boarded. The boards, that the swine may not gnaw them to pieces, should be of some harder wood than white pine, and they should be fastened with ribbings and spikes. Whatever be the constructure of sties, they should always have one part close and warm, with a tight roof over it; and the other part open, in which the trough is placed. Swine will not well bear to be wholly secluded from the weather and sunshine; and it is hurtful to them to have a cold and wet lodging; more hurtful than many people are ready to imagine.

Although there should be a part of the sty, planked and boarded and warm, covered from rain and sun, and amply supplied with litter, yet the greater part of it should have no wooden floor.—The trough in which pigs are fed should be firmly fixed to the floor, so that they may not overset it, and it is very important that the divisions of a pigsty be so numerous, that pigs of nearly equal size and strength only should be permitted to feed together, otherwise the more powerful will exclude the others, and materially stunt their growth.

The more comfortable hogs are kept, the less nourishment they require. The trough should be on the upper side covered with one or more lids, and upright pieces set before it at such distances that one hog only can put his head between any two of them. If sixteen hogs are to be kept in the same sty, it should be thirty-two feet long and twelve wide, and the apartments should be so divided, that too many of the animals may not be forced to lie together. And it would, probably, be well to divide likewise the feeding apartment. Posts should be set up in the sty for the hogs to rub themselves. If thirty-two hogs are to be kept or fattened, perhaps the better way is to have two hog-sties of the dimensions last described, placed together with a roof over the whole, and a passage between them for the purpose of carrying food to the troughs.

The upper part of the sty, or some part of it may be appropriated to storing the different articles of food, which are wanted for feeding the animals, and it would be well to have a steam boiler beneath the same roof. If a part of the roof be made to extend considerably beyond the sty, it will afford a cover for forming a heap of composts with the dung of the swine.—*Deane.*

FOOD.

Among those objects which immediately relate to health, there is no one more important, and less regarded by individuals, than their aliment. It is a mistaken notion, that one person requires an animal diet, and another, whose avocation and habits are different, a vegetable regimen; many of the diseases originating in dyspepsia, the great endemic of the Northern States, are induced by a habit of living too exclusively upon a few articles of food, most of which are animal. Nature intended that man should subsist upon the variety of bounties with which she has so liberally replenished the earth, and constituted his system in a manner suitable to partake, almost indiscriminately, of whatever is agreeable to his palate; and the injurious effects of many articles of diet are to be attributed not so much their peculiar nature, as to the refinements in cookery. Although the *roast beef* of England has become the *magnum bonum* of a good

dinner in this country, the too great freedom and frequency with which it is used, already affect the constitutions of the opulent, by those peculiar disorders which have been entailed on the descendants of the high bred families of Great Britain.—The gout was once a stranger in New England; but the luxury of modern days is preparing the way for a train of constitutional irregularities, which future generations can only regret, while they suffer its inflictions. To live long, live simply.

It is true, that animal food contains a greater portion of nutriment, in a given quantity, than vegetables, and in a proper state of preparation it is best adapted for the immediate action of the absorbents of the chyle-poetic viscera; but the digestive functions of the human system become prematurely exhausted, by constant action, and the whole system eventually sinks under great or uninterrupted excitement. If plain animal food were taken once a day, and men would substitute for the various ragouts with which modern tables are so abundantly furnished, wholesome vegetables and pure water,—or a weak, fermented beverage for the more deleterious potatoes of distilled liquors, we should see health walking in the paths that are now crowded with the bloated victims of voracious appetite. Millions of Germans have lived to an advanced age without having tasted of any thing that ever possessed life, and been wholly free from a chain of maladies which have scourged every civilized nation on the globe; the wandering Arabs, who have traversed the barren desert of Sahara, subsisting on the scanty pittance of milk from the half-finished camel that carried them, have seen two hundred years roll round, without a day of sickness.

The temperature of our food is an exceedingly important consideration. We are accustomed to take it too warm, forgetful of the fact, that artificial heat destroys the muscular tone of the stomach, vitiates its secretions and its physical powers, and induces painful and dangerous diseases of the liver. Let us take then another hint from the children of nature, who subsist on aliment of a temperature no higher than that of their own bodies, and who are generally hardy and long lived, until the simplicity of their habits is interrupted by the adoption of the vices brought among them by the civilized invaders of their native forests.—*Bosch. Medical Intelligencer.*

AMERICAN DESERT.

There is an extensive desert in the territory of the United States, west of the Mississippi, which is described in Lang's "Expedition to the Rocky Mountains." It extends from the base of the Rocky Mountains 400 miles to the east, and is 500 from north to south. There are deep ravines in which the brooks and rivers meander, skirted by a few stunted trees, but all the elevated surface is a barren desert, covered with sand, gravel, pebbles, &c. There are a few plants, but nothing like a tree to be seen on these desolate plains, and seldom a living creature to be met with. The Platte, the Arkansas, and other rivers flow through this dreary waste.

Catnip poultice, good for obstinate ulcers.—The way to make a poultice of it, is to put it on in vinegar, and boil it until it becomes soft, then thicken it with bran, spread a little butter, that has no salt in it, over it, to prevent its sticking.

HOW TO AVOID DYSENTERY.

Rules which the celebrated Dr. Rush recommended for the prevention of this disease;—He advises that spices, and particularly Cayenne pepper, and the red peppers of our own country should be taken with our daily food. Mr. Dewey, a British surgeon, informs us that the French, while in Egypt, frequently escaped the diseases of the country, by carrying pepper with them to eat with the fruits of the land. Purging physic should also occasionally be taken, as any medicine of laxative nature by preventing costiveness, will act as a preservative from this disease. A military captain in the year 1778, while stationed at Amboy, preserved his whole company from the dysentery which prevailed in the army, by giving each of them a purge of sea salt; and some years afterwards saved his family and many of his neighbors from the same disease, by distributing among them a few pounds of purging salts. This disease was also prevented in an Academy at Bordentown, N. J. by giving molasses very plentifully to all the scholars, which had the effect of keeping the bowels in a laxative state.

Another rule to be observed is to avoid exposure to the dampness of the night air; and when necessarily exposed, the bowels should be more carefully protected than any other parts of the body. The Egyptians, Mr. Dewey tells us, for this purpose, tie a belt about their bowels, and with the happiest effect. These directions emanate from a high source, and deserve serious consideration. The facts adduced are striking, and should induce others to adopt similar measures for the prevention of this destructive disease.—*N. Y. Obs.*

CIDER.

Good cider can be made any where, of good fruit, by the following method: When your apples are well ground, wet your straw with the juice instead of water; put some straw in a cask next your receiving tub, with a blanket on it, to filtrate or strain it; then put it into a good clean strong cask immediately; suffer it to have as little air as possible, to prevent fermentation. When your cask is full hang it up tight, and remove it to your cellar, not to be disturbed for one month at least. This cider will retain its sweetness for years, and be as clear as needful; it will be fit for bottling in four weeks. It should not be removed in the cask it was put up in, but racked into another. If there be any who doubt this mode, let them try one cask after the above method. The foregoing is certified from experience.

BENJ. WALDRON.

TO OWNERS OF APPLE ORCHARDS.

Save your tar for your carriage wheels; and apply round your trees a hair cord, in the following manner, which will prevent the depredation of the *Canker-Worm*.

"Take cow or horse hair—let it be spun into cords of about two inches circumference, then take a pair of sharp shears or scissors, and clip off the ends of the hair upwards, and tie the cords round the tree."

HORTICULTURE.

Rot in Sheep.—Dried Juniper Berries are a good antidote against this destructive epidemic.—As soon as the slightest symptoms of it appear in a flock, a handful of these berries should be given for every two sheep per day, and to be continued until all apprehension is removed.

NETTLES.

Every body knows that the leaves of stinging nettles are thick set with sharp prickles that penetrate the skin when touched, and occasion pain, heat, and swelling, which symptoms were imagined formerly to ensue from the prickles being left in the wounds they made. But the microscope discovers something much more wonderful in this common vegetable, and shows that its prickles are formed and act in the same manner as the stings of living animals. Every one of them is found to be a rigid hollow body, terminating in the most acute point possible, with an opening near its end.

At the bottom of this cavity lies a minute vessel or bag, containing a limpid liquor, which, upon the least touching of the prickle, is squirted thro' the little outlet, and, if it enters the skin, produces the mischief before mentioned by the pungency of its salts. Hence it comes to pass, that when the leaves of nettles are considerably dried by the heat of the sun, they sting but very little; whereas such as are green and juicy produce violent pain and inflammation.

OLIVE GATHERING IN PORTUGAL.

Towards the month of November, the olive arrives to that degree of ripeness which renders them fit for the amand operations. Like our walnuts, they are beaten from the boughs by means of long rods, while large cloths spread around the trunk, receive as many as fall within the space they occupy. The rest are gathered from the ground by women and children; and so great is the produce, that the entire population of an olive district find ample employment, in this work alone, for several weeks, although assisted by large groups who flock from a distance of nearly two hundred miles, to share the labor, and return with a little store of money thus earned, for their winter subsistence. Nothing can exceed the sprightliness of these olive gleaners; from sunrise to the hour of vespers no sound is heard than that of singing and merry converse, while every countenance reflects the gladness of the season, and the general happiness of the simple hearted peasantry. When the mills are set in motion, the farmer can securely reckon on a supply of ready money wherewith to cultivate his lands; the pork-feeder and poulterer find the braised kernel of the olive a plentiful and nutritious article for fattening their numerous pigs and turkeys; while the poor laborer, in addition to his present wages, anticipates to pay, and stores of preserved olives which, with a little bread, will long furnish the daily meal for himself and his household, almost free of cost.—An imperfect idea may be formed, even from this slight sketch, of the cheering effect produced when the national tree yields its accustomed tribute to the children of the soil, and imagination will not fail to picture, in a like degree, the deep gloom, despondency, and the disappointment that pervade all these classes when that supply is withheld, whether by the immediate visitation of Providence, in smiting the earth with a blight, or the remorseless cruelty of man, in wantonly afflicting his fellows.

The crop of wheat and rye in Pennsylvania this season, is calculated to be double that of ordinary years. A great portion of the poorer sort of land is said to have produced nearly thrice the usual quantity. The rye straw, an article of consideration in the eyes of the farmer, has surpassed expectation as much as the grain.—*Bos. Statesman.*

AMERICAN VINE.

The expedition to the Rocky Mountains found on the borders of the Arkansas, near the eastern side of the great desert, hundreds of acres of the same kind of vine (*vitis vinifera*) which produces the wines of Europe. These vines were growing in a wild state and were surrounded with hillocks of sand, rising to within 12 or 18 inches of the end of the branches. They were loaded with the most delicious grapes, and the clusters were so closely arranged as to conceal every part of the stem. Those hillocks of sand are produced by the agency of the vines, arresting the sand as it is borne along by the wind.

ENGLISH COTTAGES.

Travellers speak of the neatness, convenience and beauty of the cottages of the English farmers peeping out from among the green trees, and festooned with the woodbine and honeysuckle. The pride of the husbandman beyond the waters, exhibits itself in gathering around his habitation those ornaments, which are at once useful and elegant, attended with but slight expense and affording large revenues. Fruit trees and flowers, hedges and walks are described as blended together in scenes on which the eye rests with pleasure. The ostentation of the farmer of New England usually contents itself with rearing a huge exterior, whose construction exhausts his resources, and leaves neither disposition or resources to complete the interior, so that the husbandman often lives in a great shell, of which one portion only is rendered habitable. The ornaments which with a little attention and care might form pillars and wreaths of verdure, richer than those which the chisel of the sculptor has ever worked on temple or palace, are neglected, and the slovenly garden seems to call out shame on the hicksmen, which neglects its beauties.—*National Edis.*

WALNUTS—an excellent Family Medicine.

Every body eats walnuts; every body knows how to make a pickle of walnuts; few, however, know the medicinal virtue of walnuts. Now the fact is, walnuts when prepared, *secondum artem*, are an excellent opening medicine and laxative, and this is the way to prepare them: get the green walnuts fit for pickling, put them in a stone jar filled up with moist sugar, in the proportion of about half a pound of sugar to the score of walnuts; place the jar in a saucepan of boiling water for about three hours, taking care the water does not get in, and keep it simmering during the operation. The sugar when dissolved, should cover the walnuts, if it do not, add more. Cover it close, and in six months it will be fit for use: the older it gets the better it is. One walnut is a dose for a child six years of age, as a purgative; and it has this great advantage over drugs, that whilst it is an excellent medicine, it is at the same time very pleasant to the palate, and will be esteemed by the young folks a great treat.

To take spots out of silk, linen, or woollen.—Take spirits of turpentine twelve drops, and the same quantity of spirits of wine—grind these with an ounce of pipe-maker's clay, and rub the spots therewith. You are to wet the composition when you do either silk, linen, or woollen with it; let it remain till dry, then rub it off, and the spots will disappear. True spirits of salts diluted with water, will remove iron moulds from linen—and sal ammoniac, with lime, will take out the stains of wine.—*American Farmer.*

CANCER.

Mr. Thomas Tyrell, of Missouri advertises that a cancer upon his nose, which has been treated without success by Dr. Smith, of New Haven, and the ablest surgeons in the western country, has been cured in the following manner. It was recommended to use a strong potash, made of the lye of the ashes of Red Oak bark, boiled down to the consistence of molasses, to cover the cancer with it, and in about an hour afterwards cover this with a plaster of tar, which must be removed after a few days, and if any protuberances remain in the wound, apply more potash to them, and the plaster again, until they all disappear; after which heal the wound with any common salve. Caustery and the knife had previously been used in vain. This treatment effected a speedy and perfect cure.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 25, 1828.

PRESERVE SHEEP FROM THE GAD-FLY.

There exists in some parts of the country, a species of fly, which naturalists call *astruc*, and of the same genus with that which deposits eggs in the hair of horses, and causes botus. This fly attacks sheep, from about the middle of August to the middle of September, deposits its eggs in the nostrils of the animals, and causes those worms which so frequently destroy them. The *Merchants Gazette* recommends as a preventive, covering the nostrils of sheep with a bit of gummy substance, through which the animal can breathe, and keeping it in its place by some adhesive substance. We doubt, however, the practicability of "keeping it in its place." Another preventive which sheep owners tell us is effectual, is to keep the noses of the sheep constantly smeared with tar, from about the middle of August to the latter end of September. If the sheep swallow some of the tar so much the better, as it prevents or cures the rot, and confirms their health.

If the fly has performed its mischievous function and the seeds of the disorder are already sown, you may make use of the following: Take half a pound of good Scotch snuff, pour two quarts of boiling water on it, stir it and let it stand till cold; inject about a tubecapouful of this liquid and sediment up each nostril of the sheep with a syringe. This must be repeated three or four times at proper intervals, from the middle of October to the first of January: the grubs are then small and are easier destroyed than if worms, and have not injured the sheep as they will if deferred until later. Half an ounce of muscadillo, pounded in a little water, and added to the snuff, will make it more effectual. The owner of the sheep need not be alarmed when the operation is performed, to see the sheep very drunk and apparently in the agonies of death, as they will in a few minutes recover. I never knew any bad effects to follow. Dry snuff may be blown up the nose with a quill, and have a good effect; but it is a tedious & dry job. I have tried vinegar and blue die with but little or no success.

Instead of Scotch snuff, a decoction of tobacco will answer the purpose. A gentleman who owns a large flock of sheep, informs us that he had used it with perfect success. Spirits of turpentine are injected into the nostrils of sheep, as a remedy for worms; but that substance appears to possess no material disadvantage, which should preclude its

use for that purpose, namely, when thrown into the nostrils it kills the *sheep* as well as the worms.

From an inadvertance in our paper of the 11th instant, the notice of the annual meeting of the Massachusetts Society for Promoting Agriculture was incomplete. After the vote of thanks to the Hon. Mr. Lowell, the following vote was passed, Mr. Prince having also declined a re-election:

Voted, That the Society learn with great regret the determination of John Prince, Esq. to decline a re-election as a member of the Board of Trustees; and that the thanks of the Society be presented to him for the well known assiduity, zeal, and interest manifested by him in the cause of agriculture, while a member of the Board.

A true copy from the record.

Wm. Prescott, Esq.	
E. H. Derby, Esq.	
John C. Gray, Esq.	

☞ We beg leave to call the attention of our readers to the advertisement of Mr Champion, in our paper of this day. The American improver has now a rare opportunity to become possessed, at reasonable prices, of very fine stock.

In addition to the great variety of fruits with which the Philadelphia market is supplied, Peaches have been exposed for sale of tolerable quality and in considerable quantities. Young corn is abundant. By arrivals at New York from Charleston and Norfolk, we remark several cargoes of Watermelons.

Thames Tunnel.—We are glad to find, that the Company for prosecuting this great and arduous enterprise, have passed resolutions for its prompt completion. The water has again been entirely excluded from the shaft, and nearly 300 feet of the south Tunnel is dry. The public are again admitted to inspect the great work.—The sum expended on it is 130,000*l.* and it is calculated that only 170,000*l.* more will be necessary to complete it.

Wool.—The Boston Courier states that more than \$200,000 have been paid in this city, since the passage of the Tariff, for wool raised in Massachusetts, Rhode Island, Connecticut, Vermont, and New York.

The Clove is now cultivated in the vicinity of Port au Prince, in the island of St Domingo. A single tree has produced sixty pounds, of excellent quality. Might not this plant be cultivated in the south western part of the United States?

Blackstone Canal.—This canal is now navigable from Providence to the Alton Factory. With three or four weeks of dry weather, the navigation will probably be opened to Worcester.

The Mowing Match at Canandaigua, on the 4th excited much interest. The first premium, a Plough, was awarded to Samuel Remington, of that town, who mowed, in one minute, 100 feet in length, and a total of 892 square feet.

The tax on foreign butter and cheese, imported into England during the last year, amounted to 300,000 pounds sterling.

ST. SWITHIN'S DAY.

Most of our readers, perhaps are acquainted with the prognostications connected with St. Swithin's Day, which has just passed, being the 15th of July. The old Scotch proverb respecting it is:—

"St. Swithin's Day, gif ye do rain,
For forty days it will remain,
St. Swithin's Day, an ye be fair,
For forty days 'twill rain na mair."

The unusual quantity of rain since Tuesday last, St. Swithin's Day, has gone far towards converting us to the belief in this popular superstition, and had it not been for the late delightful change in the weather, we should have advised our farming friends to prepare for a forty days' rain, and in the meantime have cudgelled our brains for the invention of some method of making hay within doors, on the economical and labor saving principle of the Paddy, who said, "if you want your potatoes dug, fetch 'em along." While on the subject we will refer to the circumstances from which the tradition above mentioned is said to have taken its rise, which cannot fail to interest and amuse the reader. In doing this we shall again draw upon the excellent article on Popular Superstitions, in the last American Quarterly Review. Swithin, or Swithun, Bishop of Winchester, who died 898, desired that he might be buried in the open church yard contrary to the usual custom with Bishops, and his request was complied with; but the monks, on being canonized, considering it disgraceful for the Saint to lie in a public cemetery, resolved to remove his body into the choir, which was to be done with solemn procession on the 15th of July: it rained, however, so violently for forty days together, that the design was abandoned. The vulgar tradition adds that the monks, finding it vain to contend with a Saint who had the elements so completely under his controul, gave him his own way. So soon as their intention was abandoned, he became appeased, though not altogether so, and hence still reminds the descendants of those obstinate people of the supremacy of his power. In the north of Scotland this day is termed St. Martin of Bullion's Day, and the same superstition is there prevalent. One thing is certain, our summers are every year more and more assimilated to the British summers, in a majority of which there is a showery period at this season.—*Lancaster Gazette.*

Worth knowing.—The toad is said to be a voracious destroyer of that worst of all domestic vermin, *cockroaches*. It is stated that two or three toads, being placed in the kitchen one night, upon examination in the morning, were found completely gorged with those troublesome invaders of the fire-place. We have had cockroach traps invented and sold to rid our houses of these creatures, but these traps have not answered in all cases:—housekeepers will now be able to oppose a natural antidote to one of their discomforts, and a profitable commerce in toads may be the result of the discovery.—*Boston Patriot.*

TO HORTICULTURISTS.

There is a negligence amongst some who are profiting by the sale of fruit trees which should be corrected. It is extremely vexatious for a man to purchase a fruit tree, have it taken a thousand miles, nurse it a dozen years, and instead of realizing his expectations, to find fruit of a most inferior quality. This has happened with a gentleman in Frankfort, Ken. in relation to the seekle pear; and he has circulated around him the grafts, so that the injury is extensive. I hope you will put in your paper a short paragraph, that you will, upon request of any gentleman who may hereafter be imposed on, give publicity of the kind of deception, and by whom practised, provided the deception was made by a vendor of trees.* This will correct a carelessness which must be its cause:—for I cannot believe there is any man so lost to what is due to himself and to his fellow man as to thus deceive him for the paltry sum of the price of a small tree: the injury to the one, and to society, is incalculably greater than the benefit to the other.

* [We shall have no hesitation in doing it if the person making the complaint will leave his name with the editor].—*American Farmer.*

From the Southern Agriculturist.

THE PROCESS FOR MAKING CASTOR OIL.

Dear Sir. In compliance with your request, I send you the process for making Castor Oil; and hope that it may prove useful to the gentleman who requested the information.

After collecting the bunches of seeds, expose them to the sun until perfectly dry—then lay them on a scaffold, and beat them with a very small flail, which will separate the hull from the seed; then pound them in a wooden mortar till the shell of every seed is broken. Have a vessel of water at boiling heat, which you will then put the seed into from ten to twenty minutes. A dirty scum will rise which must be taken off; the clear oil will then rise, which must be put into a second vessel without water, to be acted on by a slow fire, not to arrive at boiling heat: as soon as it appears clear and transparent, taking off the scum that may appear, (which will make an inferior quality of oil) it is ready for bottling; as soon as cold, exclude it from the air. The kind of Palma Christi said to be the best for making oil, is of the species where the stalk is pink.

P. S. The quantity of water in the first vessel must be as three to one to the quantity of the best seed, and stir frequently to prevent its adhering to the bottom of the vessel, which would give it a burned taste. Be careful that it does not boil over, as it will take fire.

I remain yours, &c. S.

Rail Road.—Messrs. Makepeace and Baldwin have completed their examination and survey of the rail road, to the borders of the State of New York, through part of Pittsfield, Lanesborough, Cheshire, Adams, Williamstown, and Pownal, Vt. The inclination of the land is found to be very gradual: generally not more than from ten to twenty-five feet in a mile. The New York commissioners set out on Monday to examine the route surveyed by Mr. Baldwin last summer.—The best feelings are entertained towards this project, by the commissioners and the people of that State.—*Bos. Daily Adv.*

Apothecaries.—This business increases rapidly, and we fear that it is too often left to inexperienced boys. An elderly lady, finding herself triflingly indisposed, sent for some peppermint, and took a few drops; it produced a stupor, and on examination of the phial, it contained *hemlock*. A few drops more would have put her to sleep "to wake no more." The greatest caution is necessary in venders and purchasers of drugs.—*Enquirer*.

When to praise.—Praise the fineness of the day when it is ended—praise a woman when you have known her—a sword, when you have proved it—a maiden, after she is married—the ice, when you have crossed it, and liquor after it is drunk.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturalists in the vicinity of Boston and New York, will be published by J. B. RUSSELL, Proprietor of the New England Farmer, to-morrow. The articles are arranged alphabetically, and comprise the most useful **VEGETABLES** and **FRUITS** which can be conveniently and economically cultivated in the climate of New England and the Middle States; as well as a Treatise on **FLOWERS**, and on **LANDSCAPE** or **PICTURESQUE GARDENS**, on the general management of the **SILK WORM**, and the manufacture of **SILK**, and a Treatise on the culture of **GRAPE VINES** and the **STRAWBERRY**. The article on Fruit Trees contains an enumeration and description of all the Apples, Pears, Peaches, Cherries, Plums, Nectarines, Apricots, &c. &c. that can be raised to the most advantage, and their relative for-wardness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written.

The following is the General Index of the book, which is super-added to a Calendarial Index, giving directions for performing the work of all the months in the year as they follow in success on.

Apple	Eleanora	Mulberry
Apple tree	Endive	Mushroom
Apricot	Eschschers	Mustard
Artichoke	Fennel	Nectarine
Asparagus	FLOWERS, ORNA-	Nuts
Balm	MENTAL	Oak
Barley	FRUITS	Okra
Bean	FRUIT TREES	Onion
Beet	Garlic	Orchard
Bene plant	Gooseberry	Parsley
Bolecole	Gourd	Parsnip
Borer	Grating	Pea
Broccoli	Green house	Pear tree
Brussels sprouts	Flavithorn	Pear tree
Buckthorn	Healing down	Pepper
Cabbage	Hedges	Plum tree
Canker worm	Hoeing	Potato
Caraway	Horse Radish	Pruning
Cardoon	Hot bed	Pumpkin
Carrot	Hot house	Quince
Caterpillar	Hysop	Radish
Cauliflower	Indigo	Rhubarb
Celery	Indian corn	Rolle
Chamomile	Inoculation, or bud-	Rose
Cherry tree	ding	Rosemary
Chervil	Insects	Rue
Chive	Jerusalem Artichoke	Sage
Colewort	LANDSCAPE AND	Salsify
Coriander	PICTURESQUE	Savory
Cress, water	GARDENS	Sea kale
Cress, garden	Lavender	SILK
Cucumber	Layers	Skillet
Cornellio	Leaves	Squash
Currant	Leek	Squash
Cuttings	Lettuce	STRAWBERRY
Dandelion	Locust tree	Tansy
Dibble	Love apple	Tarragon
Dill	Madder	Teasel
Drains	Mangel Wurtzel	Thyme
Duck	Marjoram	Tomato
Egg plant	Melon	Turnip
Elder	Blind	VINE

In addition to the above, the work contains a variety of articles on Domestic Wines from the Red and Black Currant, Gooseberries, Elder Berries, &c. Jellies from fruits, preservation of fruits, &c. and many other articles on domestic economy, which will make the work desirable in families. It is handsomely printed, and makes a volume of 312 pages.

Any person who will obtain subscribers for, or engage five copies, and forward \$6.00 as payment in full, shall have a sixth copy gratis, for his trouble.

Genesee—Indian Reservation Lands.

On the 3d of September next, at Batavia, and on the 10th of September, at Batavia, will be sold at auction about forty thousand acres of land in the Tonawanda, Canaan, Buffalo and Cattaraugus reservations.

The title is indisputable, and information respecting it may be had, and maps showing the lots to be sold may be seen, on application to Thomas & Ogden, in New York—J. Fellows, at Geneva—G. W. Long, at Batavia, and H. B. Potter, at Buffalo.

Valuable English Stock.

Mr. Champion of Blyth, Nottinghamshire, who has sent several specimens of his Improved Short Horns, and high bred Leicester Sheep, into the United States, and who has for the last twenty years had the honor to obtain a great number of premiums and sweepstakes for both his cattle and sheep, at various agricultural associations, now intends to give up his farm, and to sell by auction without reserve, the whole of his breeding stock, consisting of nearly one hundred head, including Bulls, Cows, and Heifers, and the celebrated Miss Poynts, with a very superior bull calf bred from her, by Blyth Favorite. Also about 150 Rams, and 700 breeding Ewes. The sale will take place on the 4th and 5th of September next. Mr. C. has spared neither trouble in selecting, nor expense in obtaining the best animals; and his sheep combine with constitution, the most valuable qualities of size, great inclination to fatten, with a superior staple of wool, both for length and fineness. Mr. Champion will be glad to afford every accommodation to purchasers, in sending the stock to Liverpool, from which place he is distant only 95 miles. Blyth, near Hawley. (Eng.) May 12, 1833.

Patent Balance and Hay Scale Manufactory.

The subscriber, agent for Thomas' Improved Patent Hay Scales, and patent Balances, informs the public that he has on hand a good assortment of correct and well finished patent Balances of all sizes—and will furnish at the shortest notice his improved Hay Scales of any size or weight—apparatus of every description furnished separate for old or new works.

J. R. NEWELL

Budding or Inoculating

May be performed from 15th July, to the 15th September, (there are many kinds of fruit that cannot be raised otherwise) such as peaches, apricots, nectarines; and it is the readiest way of obtaining the choicest kinds of roses on sweet briar or common rose stocks. Budding of roses is the most beneficial, and the best way to increase that valuable flower. You can obtain 12 from one cutting. A man bred to the nursery business, and who has the best method known for budding, will make public the art for a small compensation; and 9 out of 10 grows. This man will attend any who has 2 or 3 days' work, at moderate wages, and may be heard of at the New England Farmer Seed Store. July 25

Patent Green House.

The subscriber proposes to solicit a patent for a green house, which will be built without stone, brick, lime or sand; also without burning any kind of fuel, or using steam or dung, and only half the usual quantity of glass. The simplicity of its construction, the cheapness of building, and the saving of expense, make this invention worthy of notice. Any man of taste can have one for a trifling sum. The subscriber would prefer a subscription from those interested, before taking a patent.

Roxbury, July 25.

GEORGE BLANKEN.

A Partner Wanted.

Who can command a capital which he would be willing to invest in establishing a Horticultural and Botanical Garden at Baltimore. He may now have an opportunity of forming a connection with a person capable of conducting such an establishment, and who possesses many advantages. For further information, inquire personally, or by letter, post paid to G. P. Miller, Baltimore. Baltimore, June 19, 1833.

For sale, an Improved Short Horned Durham Cow, and Bull Calf, three weeks old, from the Cuckles stock, of remarkable good size and form; color red and white, handsomely marked. The last year's Calf (a heifer) from the same Cow, claimed a premium at the Brighton Cattle Show in October last. Inquire at the office of the New England Farmer.

Bull Calf for Sale.

For sale, a beautiful Bull Calf by Admiral, a very desirable animal for those who feel interested in the improvement of our breed of Stock.—Apply to Maj. Jacques of Charleston, where he may be seen. July 13

German Geese.

For sale, two pairs of this superior breed of Geese, from East Friesland, Germany—produced from a pair imported last year direct from Bremen, in ship North America, Capt. Childs, and which were selected by said Capt. Childs, with the greatest care. These geese possess many important qualities peculiar to their breed—among which is, their size, their usual weight when fat being from 25 to 30 pounds each—also the large quantity of feathers which they yield, the Germans pluck them three times a year, and the feathers are considered the best in the German, English and Dutch markets—and their remarkable docile, gentle and domestic dispositions. Apply to Capt. S. P. Child, Warren R. I. where the geese are to be seen—or to Wm. B. Bradford, Jr. No. 24 India street, head of Central wharf, Boston—or to the New England Farmer Seed Store. July 18

Barefoot and Serab.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Coffin, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Barefoot, a chestnut horse, is as follows.

FOALD 1820.

Barefoot, by Trump, dam Rosamond by Buzzard, out of Roseberry, sister to Huley and Tartar, by Phenomenon, out of Miss West by Matcham—Regulus—Crab—Cholles—Basil.

In 1821, when at Pontefract, sweepstakes of 20 gs. each, for two years olds—11 subs. Barefoot beating Tempest.

In 1823, York Springs St. Ledger, of 25 gs. each, 6 subs.—Barefoot beating four others.—A. Pontefract sweepstakes of 30 guineas each ten feet, 10 subscribers. Barefoot beating Palestine.

In 1823, the Doncaster great St. Ledgers, of 25 gs. each, 30 subscribers. Barefoot beating 11 others.

In 1823, at New Market, Barefoot won a hand-cup plate value £50, beating Tresshan and five others.

In 1821, at Ascot Heath, Barefoot walked over for the Swin-las stakes, of 25 sovereigns each, 3 subs.

In 1825, at Lancaster, the gold cup, value 10 gs. added to a sweepstakes of 10 sovereigns, 17 subs. of all ages. Barefoot beating Lottery and two others.

In 1826, at Manchester, Hand-cup stakes of 30 sovereigns each, 10 ft. with 20 sovereigns added—6 subscribers—Barefoot beating two others. At Lancaster, the gold cup, value 100 gs. added to a sweepstakes of 10 sovereigns each, 9 subs.—Barefoot beating two others.

SERAB, (a beautiful bay Horse.) FOALD IN 1821.

Got by Phantom out of Jessy, by Tordred—her dam Cracker by Highflyer, out of Nutsacker, by Mateum.

In 1821, won the New Market stakes, 50 gs. each, 21 subs.—Serab beating four others.

In 1825, at the New Market Cragg meeting, the stakes, 100 sovereigns, 7 subs. Serab beating two others. The same year, Spring meeting, Serab won Hand-cup sweepstakes, 100 sovereigns, 6 subs. beating three others.

In 1826, Serab won King's Plate, 100 gs. beating 30 others.

In 1827, Stocion, Serab won the gold cup. J. B.

MISCELLANIES.

TO A CHILD.

Thy memory as a spell
Of love, comes o'er my mind—
As dew on the purple bell—
As perfume on the wind—
As music on the sea—
As sunshine on the river—
So hath it always been to me
So shall it be to ever.

I hear thy voice in dreams
Upon me softly fall,
Like echo on the mountain streams
In sportive water-fall.
I see thy form as when
Thou wert a living thing,
And blossomed in the eyes of morn,
Like any flower of spring.

Play soul to heaven hath fled,
From earthly thrall-dom free;
Yet 'tis not as thou'st dead
That thou appear'st to me
In slumber, I behold
Thy form as when on earth—
Thy look, of waving gold—
Thy sapphire eye of mirth.

I hear in solitude,
The prattle, laugh and fee,
Thou utter'st in joyful mood,
While seated on my knee.
So strong each vision seems
My spirit that doth fill,
I think not they are dream,
But that thou livest still.

Cardinal Wolsey, one of the greatest ministers of state that ever was, poured forth his soul in these sad words: "Had I been as diligent to serve my God, as I have been to please my king, he would not have forsaken me in my gray hairs."

Dead of death—It is a common symptom in nervous disease, and is here considered with its regard to its influence on health. In these cases it seems rather to spoil life than destroy it. Not only the child, but the young man till thirty never feels that he is mortal; but after forty a man's thoughts are much occupied by the inevitable prospect, and most of us have our little corps of consolation to protect us from the force of it. Those of authors come out in their works. One of the most remarkable, is a little Essay on Death, by Lord Bacon; not that in his Essays, but towards the end of his works, near his will. The curate of a London parish, who has great experience of death-bed scenes, was asked how people generally met their end? And the answer was, "either they wish for it as a relief from suffering, or they are not conscious of it." Even Dr. Johnson, who dreaded death so much at a distance, seems to have feared it as little on his arrival as other people; and we believe that to many persons with right views, who have had a liberal allowance of sickness and sorrow, death becomes an object not so much of apprehension as of curiosity and interest. This state of mind is not only necessary for our comfort during health, but for our safety during sickness. One of the ablest physicians alive, once said that in a dangerous illness, *ceteris paribus*, a christian would have a better chance of recovery than an unbeliever—that religious resignation was a better soothing medicine than a poppy,

and a better cordial than an aether. Dr. Reid gives a similar opinion in the following expressive passage: "The habitual horror which thus overshadows the mind, darkens the little daylight of life. An indulgence in this morbid excess of apprehension not only embitters a man's existence, but may often tend to shorten its duration. He hastens the advance of death, by the fear with which his frame is seized at its real or imaginary approach. His trembling hand involuntarily shakes the glass in which his hours are numbered."

Contradictory as it may appear, there are well attested instances of persons who have been driven even to suicide by the dread of dissolution. It would seem as if they had run into the arms of death in order to shelter themselves from the terror of his countenance.—*Quar. Rev.*

Method, as Mrs. More says, is the very hinge of business; and there is no method without punctuality. Punctuality is important, because it subserves the peace and good temper of a family; the want of it not only infringes on necessary duty, but sometimes excludes this duty. Punctuality is important as it gains time; it is like packing things in a box, a good packer will get in half as much more as a bad one. The calmness of mind which it produces, is another advantage of punctuality; a disorderly man is always in a hurry; he has no time to speak with you, because he is going elsewhere; and when he gets there, he is too late for his business, or he must hurry away to another before he can finish it.—It was a wise maxim of the Duke of Newcastle—"I do one thing at a time." Punctuality gives weight to character.—"Such a man has made an appointment; then I know he will keep it." And this generates punctuality in you; for like other virtues it propagates itself: servants and children must be punctual where their leaders are so. Appointments indeed, become debts: I owe you punctuality, if I have made an appointment with you, and have no right to throw away your time if I do my own.

Agriculture.—I one year raised a large supply of carrot seed, so that I had much left after sowing the next year, and continued to sow from the same parcel for seven years at least; but was surprised to find, as I thought, my ground much impoverished, though yearly manured; for, at the last, though my seeds vegetated, which I thought a sufficient proof of their goodness, yet at last they did not grow well for two or three years, till they were little larger than pipe-stems, and were not worth pulling. But as my seeds vegetated, I was wholly unconscious of the cause; however, I finally threw away my seeds and got new ones; and the next planting in the same ground succeeded well; my seeds vegetated quicker, grew thrifty, and produced abundance; and I am within bounds in saying of ten times the size of those produced from the old seed. Now, what is the value of a carrot seed to a carrot? a beet seed to a beet? a cabbage to a cabbage?

Temperance.—It is worthy of record, that no *ardent spirits* were used by the seamen, at their dinner on the Neck, on Friday the 4th inst. This is really one of the most encouraging signs of the times—that a class of people, whose profession has always been held to give them a peculiar license in all the points of minor morals, and whose hardships have often no other alleviation than is furnished by a recourse to the *can of grog*, should

set an example of this kind, was more than the most sanguine friend of temperance could have expected.—*Salem Gazette.*

The toad.—An English farmer on the 20th May, 1826, inclosed a small toad in a garden pot, rendered air tight, and buried it in the ground; and on the 14th May, 1828, in presence of a witness, he dug up the pot, and found the toad not only alive, but hearty, and apparently in a thriving condition, as it had grown considerably; the lustre of its brilliant eyes appearing to be not a whit diminished by its long incarceration.

Dr. Macartney, the anatomical professor in Dublin, with about fifty other surgeons, have begun the patriotic work of surrendering up their own bodies for dissection, by signing, with all due solemnity, an order to their respective executors to that effect.—*Albion.*

In a Charleston paper now on our table, is an advertisement of a *raffle*—and the article to be gambled for is a folio Family Bible!—The advertisement is headed, "faint heart never won a fair lady."—*Providence Patriot.*

Large coal.—Five dollars was refused last week for a single piece of coal, while passing through Pottsville, from one of the mines of the North American Company. It weighed upwards of a ton and a half.

"What constitutes a *stote* of drunkenness? A court in Pennsylvania have decide: that a man was not a habitual drunkard unless he was intoxicated *half the time*: and in New York, unless drunk *all the time*.

Turnip Seed, &c.

Just received at the New England Farmer Seed Store, No. 22 North Market Street, Boston, an extensive assortment of Turnip Seeds, some of which are the growth of the present season—the finest sorts either for family use or stock. The most improved sorts for the former are the White Stone, White Dutch, Yellow Stone, Yellow Malta. The *Yellow Stone* is one of uncommon excellence and keeps well. Of the sorts for field culture, the White Norfolk, White Globe, and *Yellow Aberdeen* or *Bullcock* are preferable. The *Yellow Aberdeen* is most approved among the farmers of England and Scotland, as it grows to a large size, is very sweet and nutritious, and keeps till June. Also, *Yellow Ruta Baga*, or Russian Turnip, of the best description. The above seeds were saved in Europe expressly for us, and the utmost dependence may be placed upon their genuine quality. A variety of Long and Turnip Radishes, suitable for growing the three ensuing months. Prickly or Ball Spinach, Long Prickly and Early Cluster Cucumber; also the genuine Gorkin Cucumber, or West India pickling one of the finest pickles.

Likewise 200 lbs. fresh common white flat English Turnip Seed, a part of it the growth of 1828;—to dealers and purchasers by the quantity, it will be put at a low rate.

Oat Meal, Oat Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine Bolled Oat Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantity, wholesale or retail. Also a few canisters of fine Oat Flour, neatly packed, at 50 cts. per canister.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Bremen Geese.

For sale, 10 pair fine Bremen Geese. Apply at the New England Farmer Seed Store. July 4.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of five cents.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VII.

BOSTON, FRIDAY, AUGUST 1, 1828.

No. 2.

THE ARTS.

FOR THE NEW ENGLAND FARMER.

KELP, OR CRUDE SODA.

MR FESSENDEN, —Considering the vast increase of the manufacturing establishments in our country it may be thought extraordinary that the manufacture of kelp or crude soda has not received the attention of our industrious and enterprising citizens; those especially, who are particularly interested in the bleaching, soap, and glass establishments. The plants from which kelp may be obtained are to be found in inexhaustible abundance on our shores without the trouble of culture; especially at Cape Ann and Marblehead, and are frequently employed as a manure. The manufacture is so simple as to require no scientific knowledge; a few days' experience on a small scale would enable any person to prosecute the business extensively, and no doubt to great pecuniary advantage. In conversing with a gentleman interested and experienced in the great bleaching establishment at Dover, N. H. he manifested a disposition to introduce and encourage the use of American kelp if he could be furnished with a sample for experimental trial, and it should be found to answer the desired purpose. The American article may, it is presumed, be afforded at a lower price than the imported.

Fuci is the botanical or generic term for the various species of marine plants commonly known by the names of sea-weed, sea-wreck, and seaweare. They are found on flats at low water, or attached to rocks near the shore and in coves. It has been ascertained that *Fuci* grows with astonishing rapidity from floating seeds lodged on rocks and stones.

Fuci vesiculosus. In this species, the frond is a leaf-like substance resembling leather or parchment, midribbed, the stem forked or parting in pairs one after another. The vesicles or air bladders are globular and innate in the membrane of the frond. It is readily distinguished from *Fuci nodosus* by the air bladders very generally occurring in parallel pairs, while in *nodosus* they are single; and from *F. serratus* by the edges of the frond being entire or wanting the serratures which mark that species. It is generally from one to three feet in length. One pound of the ashes gives three ounces of kelp. This species is most highly prized for the manufacture of kelp.

Fuci nodosus. The frond is leathery, compressed, veinless, branched, and feathery, the receptacles are divided and have a small stem, roundish, mostly solitary. Fronds from two to six feet in length and at short distances swell into large air bladders.

Fuci serratus. Frond, leathery, flat, midribbed, divided; serrated at the margins. Receptacles solitary, flat at the ends of the stem, serrated, sharpish. It grows in deep water, and is only uncovered at the ebb of the tide. This is inferior for kelp.

Fuci locus. This is the small kind, growing abundantly on rocks, and is called rock-weed. — This yields well in excellent kelp. It consists of a simple frond without branches, and is sometimes

called catgut. It affords considerable quantities of kelp.

Fuci palmatus, is the kind known by the name of dulse. It is divided deeply and spreading so as to resemble the hand with the fingers spread. This also yields good kelp.

The public are indebted to Dr. John Revere, now of New York, for the following valuable communication, relative to the crude sodas of commerce. It has been published in Professor Silliman's excellent journal, for December last, and merits a republication in the New England Farmer, for the benefit of our citizens who reside on our sea coast. J. T.

Plymouth, July 17, 1828.

Some Remarks on the Crude Sodas of Commerce: by JOHN REVERE, M. D. Lecturer on Chemistry, applied to the Arts, at the Maryland Institute for the Promotion of the Arts and Manufactures.

New York, October 15, 1827.

SIR.—In a course of lectures on chemistry, applied to the arts, I had occasion to collect the facts contained in the following paper. To those who are familiar with the science of chemistry, there will be little that is new. I have been induced to offer these remarks to your Journal, rather from a desire than the general scope of its contents, which I observe are almost purely scientific. The importance of this substance in the useful arts, the ignorance observed among manufacturers and dealers respecting its nature, and the shameful impositions sometimes practised, constitute its chief claim to your attention. The fact stated may be relied upon, as they have been established by repeated experiments.

JOHN REVERE, M. D.

Crude soda, in whatever manner procured, is generally known in this country, among manufacturers and merchants by the name of *barilla*.—But as the value of the article depends very much upon the former circumstance, it will be proper to observe, that it is obtained as an article of merchandize, chiefly in four different modes, viz. 1. in a saline form, on the surface of the earth, and from the water of certain lakes; 2. from the incineration of certain land plants; 3. from the combustion of marine plants; and 4. from the decomposition of sea salt by chemical processes.

The crude soda, formerly known by the name of *natron*, is found in considerable quantities in Egypt, the interior of Africa, and in South America. It exists in lakes, and in particular districts, and forms an efflorescence upon the surface of the earth during the dry season. I am not aware that in this form, it is known as an article of commerce, in the United States.

The most valuable of the crude sodas known in this country, are obtained by the incineration of several kinds of plants which grow in the vicinity of the sea. The best is brought from Alicante, Malaga, and Carthage. In Spain; it is obtained from an annual plant, the *salsola sativa*, which is cultivated and secured like hay, and afterwards burnt in holes dug in the earth. From the great quantity of soda it contains, it melts into thick paste, which on cooling, becomes condensed into a stonelike mass; the popular name of this plant

in Spain, is *barilla*. So highly is this plant esteemed in Spain, that, according to Mr Parkes, the exportation of the seed is prohibited, under penalty of death. There are several varieties of the *salsola* cultivated on the shores of the Mediterranean, especially in the island of Sicily, and also in the Canary Isles, which yield an abundance of soda. For convenience, all the crude sodas obtained by the combustion of land plants, may be called *barilla*. The *barilla* most common in our market is brought from Spain, Sicily, Teneriffe. Although many parts of the United States are favorably situated, I have known but one attempt to cultivate them. It was made on the eastern shore of Maryland, from seed procured for the purpose in Sicily. The attempt failed, owing evidently to the imperfection of the seed.

The increased demand for soda for the arts, throughout the civilized world, has led men to seek other sources from which this useful substance may be procured. Modern science and industry have succeeded in extracting a large supply from marine plants, which were accounted so entirely worthless among the ancients, that *algæ projecta relinere*—a common proverb at Rome.—The substance procured by the combustion of these plants is called by the French *vercch*, and by the Dutch *schelp*. The inhabitants of the coast of Europe have been in the habit, from time immemorial, of collecting the sea weed, *uratic* or *sea ware*, as it is indiscriminately called in Great Britain, and manufacturing it into a coarse alkali for domestic purposes. It is only, however, within a century that any attempt has been made in Great Britain to prepare the kelp in a large way. It was in the year 1723 that this substance was first brought into the market as an article of merchandize. But the great consumption of the alkalis in the modern arts, especially by the bleacher, soap and glass manufacturer, and other manufacturing chemists, has attracted more and more attention to the subject, until the manufacture of kelp in Great Britain has become a very important department of industry. I am under the impression that kelp has never been brought into our market, or attempted to be manufactured in the United States, but as it appears to me that this manufacture may be introduced advantageously among us, I propose to give some account of the most approved method at present practised, in the hope that it may direct the attention of those persons to the subject, who are conveniently situated for making the attempt. From the increase of our manufactures, and as all the crude soda at present consumed are imported, it is highly probable that there would be a full demand for the article. The material may, for the trouble of collecting it, be had in immense quantities, along our extensive sea coast, nor can anything be cheaper or more simple than its manufacture. Some idea may be formed of the advantages that may be derived from this manufacture, from the great and obviously increasing importance that is attached to the subject in Great Britain. There are frequent communications on the subject in their best journals, and prizes offered to encourage its cultivation, by their societies for the promotion of the arts and manufactures. As long ago as 1798, it

was stated by Professor Jameson in his mineralogy of the Shetland Isles, that "farms which before the introduction of kelp, rented for forty pounds, now rent for three hundred pounds." It is also asserted by Mr. Parkes that Lord McDonald of the Isles, now realizes ten thousand pounds per annum from his kelp shores, which his ancestors considered valueless.

Nearly all marine plants, especially the *fuci*, are found to yield soda from combustion. Those which are preferred are the *fucus vesiculosus*, *nodosus*, and *serratus*; they are found spontaneously growing on the rocks near the shore, generally between high and low water marks. Generally speaking, bays and coves that are sheltered from the winds and tides are found best, though some of the *fuci* flourish best in the most exposed situations, and the strongest tide-ways. Formerly, the kelp was made entirely from the floating sea-ware as it washed up on the shore; but, since the manufacture has become profitable, greater care is taken in its preparation. It is now common to cultivate these plants by depositing on sandy beaches large boulder stones, to which the *fuci* may readily attach themselves, and to cut and collect the ware; calcareous stones are found best. In the Repertory of Arts, there is a particular description of the process employed in the manufacture of one hundred and fifty tons, on the farm of Stroud, in Horris, which received the prize of the Highland Society.

This sold for five pounds ten shillings per ton. As this is considered the most approved method, I will give an abstract of it. In the Orkneys, they account the spring the best season for cutting the ware, because they are less exposed to the rains. The weeds that are left bare by the tide are cut with sickles, and those under water with bill hooks. It is considered important to land the ware, as fast as it is cut, and to carry it to a suitable situation to dry; it is thought that as soon as the weed begins to wilt, the pores of the plant become relaxed, and allow the soda to exude, which is dissolved and lost, if the ware be left in the water or exposed to the rains. There is no doubt that kelp made from such ware is weaker. It is spread on clean ground to dry, and when pretty well dried, it is collected into large cocks, protected from the rain if possible, and allowed to heat for six or eight days, or even from fifteen to twenty if the ware has been collected from coves with muddy bottoms. A dry day, when there is a brisk breeze, is selected for burning the ware, which is conducted in the following manner. The kilns are rudely constructed of stones and turf upon the firmest sward that can be found. The most convenient are about two feet six inches in height, two feet four inches in breadth, and from eight to eighteen feet in length, according to the quantity of ware to be consumed. A little dry straw is first spread over the bottom of the kiln, and kindled, to which the ware is slowly added, as fast as it is consumed, the combustion being accelerated by the breeze. Should the weather become calm, or if the ware is not sufficiently dry, the ashes cool and cake into white crusts, when it becomes necessary to rake the ashes until the combustion is perfect, before adding fresh ware. When the ware is all burnt, the last process consists in working or raking the ashes with iron rakes, so that the combustion of every part shall be perfect. It is transformed into a thick paste, which, on cooling, becomes solid, somewhat resembling good indigo; it

is then broken up into masses of about two hundred weight, covered with dry ware, and is ready for the market. If the ware has been taken from a muddy situation, it sometimes happens that the ashes remain dry, and do not assume the form of a paste. By allowing the combustion to continue a little longer, or by adding some salt or saltpetre, the difficulty is easily overcome. The kelp is found to yield from three to six or eight per cent. of pure soda. (To be concluded next week)

FOR THE NEW ENGLAND FARMER.

Copy of a letter from Dr Mitchell to Wm Prince, Esq. Proprietor of the Linnean Botanic Garden.

New York, 19 June 1828.

WM PRINCE, Esq.—I offer you thanks, my dear sir, for the copy I very lately received of your Short Treatise on Horticulture, &c. It came in very seasonably after the perusal of Mr Wilson's publication, and of Major Adlum's tract on the Vine, to which I may add Dr Mease's book on Silk, compiled at the request of the Secretary of the Treasury.

I have gone through it once with pleasure and instruction, and I intend to do it again. You have united so much science with practice, or in other words, associated so much Botany with Gardening, that I shall keep it near me as a work for steady reference.

I consider your descriptions of Fruit trees and fruits, of Ornamental trees and Shrubs, Grape and Strawberries, Bulbous roots, Green house plants, and others, highly interesting. I am interrupted by visitors, and have only time to offer one of my late feeble efforts in return,

So farewell,

S. L. MITCHELL.

FOR THE NEW ENGLAND FARMER.

SILK WORMS.

MR. FESSENDEN,—The attention of the public has been so much engaged lately in the history and rearing of the SILK WORM, that every thing connected with the subject must be interesting. Under this impression, I would state the following facts, to show that these entirely inoffensive and defenceless insects are exposed to suffering from the attacks of an insidious enemy from which they should be protected.

On visiting my little family of worms, I several times remarked that a spider had let himself down upon the place where they were feeding, and had evidently been an annoyance; and have since had reason to believe that some perished from wounds which they had received. Yesterday, on visiting the matted moths, I perceived a large male moth suspended about a foot above the shell, by the scarcely visible filament of a spider's web, attached to the ceiling, two feet and a half above; and found that this had been effected by a little bottle spider (so called) whose bulk was not equal to a twelfth part of the moth's, and whose weight must be still more disproportionate.

It.

Dorchester, July 29, 1828.

FOR THE NEW ENGLAND FARMER.

POTATOS FOR CATTLE.

MR FESSENDEN—I observed in a late New England Farmer an article from the Massachusetts Agricultural Repository, headed "raw potatoes bad for milch cows," stating that they were of a gripping nature. As to the effects they may have on

milch cows, I am not so well informed, although I have occasionally given them to cows about the time of calving, both before and after, to stretch their bags. But it is generally said among farmers, that although potatoes increase the quantity of milk, they render it more thin and less nourishing. Even of this I am not certain, for I have always found them a very nourishing food for neat stock. For many years past I have fattened my beef solely on raw potatoes, and have witnessed none of the accidents alluded to, nor observed any of the gripping effects mentioned. Cattle will almost invariably devour them greedily, even at first, and if they are then given too plentifully, a relaxation is produced, which feeding with hay will soon correct. Several years ago I fed one cow separately on ruta бага or Swedish turnip. She did well, but did not thrive so fast as those fed on potatoes. And I would here remark, that the ruta бага gave no bad taste to the beef, as some have feared it would. I have found that while I resided in a town not so near Boston market, and where potatoes were raised in greater abundance, that they were on the whole, the cheapest and best food for fattening cattle I could raise. A FARMER.

Lynn, July 28, 1828.

Remarks by the Editor.—The observations of our correspondent, as given above, are in perfect accordance with those of Mr LOWELL in his remarks on the article alluded to by our correspondent;—and republished in the Massachusetts Agricultural Repository for the express purpose of proving its statements to be incorrect.

FOR THE NEW ENGLAND FARMER.

AMERICAN LYCEUM.

We have been requested to give an insertion to the following prospectus, and are well wishers to the plans for improvement which it contemplates.

The undersigned agree to associate under the name of the ——— branch of the AMERICAN LYCEUM, and adopt the following articles for their constitution.

Article 1. The objects of the Lyceum are the improvement of its members in useful knowledge, and the advancement of popular education, by introducing uniformity and improvements in common schools, by becoming auxiliary to the Board of education.

Article 2. To effect these objects, they will procure a cabinet, consisting of books, apparatus for illustrating the sciences, and a collection of minerals, will hold meetings for discussions, dissertations, illustrating the sciences, or other exercises which shall be thought expedient.

Article 3. Any person may be a member of the Lyceum, by paying into the treasury annually, two dollars; and twenty dollars paid at any one time, will entitle a person, his or her heirs or assigns, to one membership forever. Persons under eighteen years of age will be entitled to all the privileges of the Society, except of voting, for one half the annual sum above named.

Article 4. The officers of this branch of the Lyceum shall be a president, vice-president, treasurer, recording and corresponding secretaries, three or five curators, and three delegates, to be appointed by ballot on the first Wednesday of September annually.

Article 5. The president, vice-president, treasurer, and secretaries, will perform the duties us-

ally implied in those offices. The curators will have charge of the cabinet and all other property of the Lyceum not appertaining to the treasury, and will be the general agents to do any business for the Society under their direction. The delegates from other branches of the Lyceum in this county semi-annually, to adopt regulations for their general and mutual benefit, or to take measures to introduce uniformity and improvements into common schools, and to diffuse useful and practical knowledge generally through the community, particularly to form and aid a board of education.

Article 6. To raise the standard of common education, and to benefit the juvenile members of the Lyceum, a portion of the books procured shall be fitted to young minds; and teachers of schools may be permitted to use for the benefit of their pupils who are members of the Lyceum, the apparatus and minerals under such restrictions as the association shall prescribe.

Article 7. The president or any five members will have power at any time to call a special meeting, which meeting shall be legal if notice shall be given according to the direction in the by-laws.

Article 8. The Lyceum will have power to adopt such regulations and by-laws as shall be necessary for the management and use of the cabinet, for holding meetings, or otherwise for their interest.

Article 9. The foregoing articles may be altered or amended by vote of two thirds present, at any legal meeting; said alteration or amendment having been proposed at a meeting, not less than four weeks previous to the one at which it is acted upon.

APPARATUS FOR SCHOOLS, ACADEMIES, AND LYCEUMS.

A set of apparatus, of a simple and practical character, particularly designed for illustrating the most important branches of a popular education in schools and lyceums, is already devised and collected, and consists of the following list, and numerous other articles, as they shall be called for, namely,

For the mathematics, are a diagram, to illustrate the nature and uses of addition, subtraction, multiplication, and division; several diagrams to show the properties and uses of the different superficial figures, such as circles, ellipses, squares, triangles, &c. with the method of finding their contents; models of various solids, namely, of cylinders, prisms, cones, pyramids, parallelepipeds, and spheres, fitted to illustrate the method of measuring wood, timber, cisterns, bins, cellars, wells, canals, &c. &c.; also the different quantity of surface necessary to enclose a given bulk in different shaped solids.

For natural philosophy, are a set of mechanical powers, namely, levers, simple and compound—pulleys, single and multiplied—wheel and axis—wedge—screw and inclined plane—a hydrostatic bellows and syphon, intended to illustrate the laws and power of water, particularly the hydrostatic press.

For chemistry, are a pneumatic eistern, an iron cylinder for making gasses by heat, a flexible tube, and such other articles as shall be called for.

For astronomy, are a representation of the solar system, a globe for showing the change of seasons, the five zones, the equator, ecliptic, and meridians; several articles for illustrating eclipses, a

machine for tides, another to show why there is a tide on the side of the earth opposite the moon, and one to show why the earth and other planets are flattened at the poles.

The articles in the above list can be procured for fifty dollars.

COLLECTIONS OF MINERALS.

Specimens in geology and mineralogy, intended to represent one hundred of the most useful productions in the mineral kingdom, are collected in quantities sufficient to supply such schools, lyceums, and individuals, as shall wish to procure them, and consist of the following minerals, viz.

Quartz, three varieties—mica, two—felspar, two—granite, six—gneiss, two—mica slate, three—lime, four—marble, twelve—hornblende, two—hornblende rocks, five—argillite, two—talcose rocks (soapstone), three—sandstones, three—gray wacke, three—chlorite, one—chlorite slate, two—gypsum, four—porphyry, three—amygdales, one—asbestos, two—serpentine, two—jasper, one—clay, three—soils, five—coal, ten—iron, ten—lead, one—copper, one—graphite, one—rock salt, one.

Each specimen will be labelled and numbered; with a description of its ingredients, properties, uses, and localities, in a small volume to accompany each set.

The collection above named, with the volume, can be procured for twenty dollars.

Letters upon the subject of apparatus or minerals directed to JOSIAH HOLBROOK, BOSTON, will be duly attended to.

From the Montgomery Freeman.

RHEUM PALMATUM, OR PIE-PLANT.

Improvement in rural economy is of a tardy growth, compared to the progress of the mechanic arts. In the latter, some fortunate genius invents a labor-saving instrument—he hastens to Washington—obtains a patent, and if he has in fact discovered any thing materially useful, it is soon extensively known, and every where applied. Not so in rural affairs. No farmer or horticulturist, whatever improvements he may make, ever thinks of asking a patent. His discoveries are noticed by a few of his neighbors only, and it is a long time before his country duly appreciates the value of whatever he may introduce. The history of potatoes, confirms these remarks; for notwithstanding their intrinsic merit—notwithstanding they yield their treasure so soon after planting, and require so easy and simple a dressing; it was nearly two hundred years after they were carried to England, before they found their way into many of the best cultivated gardens, and to the opulent tables of that country.

The pie-plant is another instance of the slowness and difficulty with which every new vegetable finds its way to notice. There is every where a partiality to articles of customary culture, and it is with hesitation and reluctance that our cooks attempt to dress new ones, or to bring them upon the table. Besides, the pie-plant is three or four years coming to any degree of maturity; which discourages many persons from attempting its cultivation, and for a long period deprives the cook of an opportunity of gaining, or exerting her skill. In addition to all this, the true name of the plant, (rhubarb) has, in some instances prevented its culinary use, and compelled the cultivators to give it a new one (pie-plant) in order to prevent a pre-

vious nausea and disgust. But in opposition to all these circumstances, within sixty years past it has spread from its native Tartarian mountains or the hills of Thibet, to every part of the globe where horticulture is understood; and now bids fair to be as extensively used as any other production of the garden. In England it is in high estimation. Mr. Cobbett says that not less than thirty wagon loads of this article is sold every day in the London markets.

These remarks are made to awaken the attention of the Montgomery farmers to the cultivation of this valuable esculent. It is the best propagated from the seed, which is now just ripe, and should be planted immediately; for if not sowed until spring, it very often fails to germinate, and a season is lost—whereas, let it be directly committed to the earth, and in a few days it will be up. If the weather should then be hot and dry, let the young plants be shaded from the violence of the sun. They will require no further attention until the next spring, when they should be taken carefully up with as much dirt about the roots as possible, and transplanted where they can always remain. If the soil be deep and good, they will improve for twenty years, annually producing an abundant crop. A dozen plants are sufficient for a family. Those who would wish more particular directions, may consult Fessenden's "New American Gardener," just published at Boston.

AGRICOLA.

Tea plant.—This plant has within the last few years been cultivated in Brazil, on a very large scale, and with great success. It was originally brought from China, about the year 1816, by orders from king John 6th. and during the administration of Count la Barea; when a number of Chinese, accustomed to its cultivation and preparation, were, at the same time, conveyed to Rio de Janeiro, for the purpose of naturalizing it. It was first planted at the royal estate of Santa Cruz, formerly belonging to the Jesuits and now converted into a perfect paradise; and eventually it was spread to several of the Provinces. In that of St. Paul, where the soil and climate have been found peculiarly congenial; the plantations are on an extensive scale, and the Brazilians are said already to grow sufficient for their own consumption. In five years, it is expected, they will be able to export a considerable quantity, which certainly will be considered a phenomenon. A Brazilian young gentleman, who has for some years been pursuing his literary and useful researches amongst us, has furnished several scientific persons in London with samples of Brazilian tea; and, on infusion, it is found stronger than that of China, usually drank, which may, perhaps, be owing to its being of last year's growth, whilst the tea consumed in England is generally three or four years old. Should this new article be imported here, it is a query under what denomination it can be placed, unless the custom-house allows it to rank with medicinal herbs.—*London paper.*

To remove an attack of the sick headache, a correspondent in one of the monthly journals recommends the patient to take a table spoonful of ginger, mixed with a lump of sugar, in a tumbler three parts full of water, with the chill off; to sit, for a quarter of an hour, with his feet in water agreeably warm; and to apply a napkin, wrung out of cold water, to his temples or forehead, whichever part appears most affected.

BEET SUGAR.

It may be within the recollection of some of our readers, that when attempts were first made to extract sugar from the beet, the project was treated with great ridicule. The first experiments on a large scale were made under the patronage of Napoleon, when at the height of his power he attempted to enforce his famous continental system, against England, and she, in return, seized upon the colonies, and destroyed the commerce of France. The English, of course, amused themselves very much at the Emperor's expense, and we recollect a caricature that had a great run at the time representing the imperial family employed in making this sugar; Napoleon himself standing at a tub, with his arms dyed to the elbows in a liquid whose crimson color might have a double meaning, and the little king of Rome sitting on the floor, and sucking a beet root for his supper.—But in spite of smuggling and ridicule, and, worst of all, of peace, which brought back the West India article, the manufacture of beet-sugar continued to flourish, and seems to have thriven all the better for being deprived of imperial patronage.—In fact, it has gradually extended itself until, at the present time, it seems there are more than sixty manufactories of this article in the various parts of France. One of our latest Havre papers we see mentions that two new establishments for making this sugar were about to be set on foot near Valenciennes, and another on a large scale near Paris. And in proportion as the manufacture has increased, it has been improved by the science and art of the practical chymist, particularly in the boiling and chrysalization, till it is thought that the manufacturers will soon be able to afford their sugar made in this way, as cheap as that which is imported from the East or West Indies.—*N. Y. Jour. of Commerce.*

HEMP.

The high duty on hemp, canvass and duck, will, for a time, be a matter of some inconvenience—and the only way to obviate it, is to set about the business of cultivating hemp, and manufacturing the articles from it that are needed. This may be made a profitable business. We are not aware that any considerable quantity was ever raised in this State; but there could not be a better region for it. It is a hardy plant, and will grow in almost all climates. It is grown in India, in Italy, and Russia. It may be cultivated throughout the whole extent of the United States. Our thrifty housewives will tell you, that it will flourish luxuriant here, for it is their custom to scatter a handful of seeds by the side of their bee-house, where it springs up and grows without care or attention, and continues to blossom and yield food for bees until they retire into winter quarters. One sowing, for this purpose, is sufficient. It will spring up year after year like the common weeds, from the seed which sows itself. There could not be a better or more suitable and profitable crop for new lands. It yields from six hundred to a thousand pounds of clear hemp per acre, and when properly prepared, brings, in the market, of middling quality, two hundred dollars per ton. The principal labor is in the dressing and preparing. It should be water-rotted. Every town furnishes conveniences for doing this, and a little experience will soon enable one to regulate this part of the business understandingly.

There has been a prejudice against American

hemp which has prevented its use; but this prejudice arose from the improper manner of preparing it. It has been found that the fibre of American hemp is better and stronger than the Russian, when prepared like it. This has been proved by the experiments of the navy commissioners, who were directed by Congress to institute a course of experiments on the subject.—*Farmers' Journal.*

PREMIUM ON MULBERRY TREES.

These trees grow readily in our soil, and require scarcely more attention than is given to the common forest tree. But gardeners and agriculturists have not yet taken the precaution to prepare nurseries of them for an extensive supply.—If our enterprising husbandmen therefore wish to set these trees out in great numbers, we fear they must go beyond the confines of the State to obtain the best kinds and in sufficient abundance. Under these circumstances we respectfully suggest to the *Middlesex Society of Husbandmen and Manufacturers*, the propriety of offering a premium for the best mulberry orchard, to contain not less than fifty trees, which are not less than three years old. A premium of ten or twenty dollars would turn the thoughts of farmers to the subject, and, in a few years, they would have as many mulberry trees in progress as would be wanted for the cultivation of silk. A premium might also be proposed for the best mulberry nursery, which should contain not less than five hundred or even a thousand trees, not less than one year old. When the directors of the *Middlesex Society of Husbandmen* meet to propose premiums, we trust this subject will not be overlooked or forgotten.—*Concord, Ms. Gazette.*

INOCULATION.

The time for budding fruit trees has arrived, and we hope that it may be more generally improved than it has been heretofore. The principal reason why more good fruit is not cultivated, is that it takes so long to get the trees in a bearing state. There are few farmers, however, who have not good apple stocks for inoculation, the fruit of which now is of little worth. If these were budded the present season, in three or four years they would begin to yield fruit. The difference between indifferent fruit and that of the best kind is so great, that few we should hope would forego a luxury so cheaply to be obtained.

In the *Spy* of the 2d instant we made some remarks on the practicability of a more extended application of grafting and inoculation, and alluded more particularly to the inserting of the Madeira nut, or English walnut, on the butter-nut stock. A friend of ours who has cultivated that nut, and who has inoculated almost all kinds of trees, says that the Madeira nut tree so nearly resembles the butter-nut and black walnut, that he has no doubt of its growing well in either of them. We hope the experiment may be made, particularly in those parts of New England, where the winters are most mild, and best adapted to the rearing of this nut. We hope, also, that some of our neighbors may try the experiment of budding the improved varieties of the shagbark walnut, upon those of a poorer quality, and also upon the pig-nut tree.

In confirmation of our former remarks, we find in the *New England Farmer*, a letter from a correspondent, who says he has four thousand scions growing, which were set this spring; among which are pears in locust and forest hazel stocks,

and apricot, peach, and mulberry scions in plum tree stocks. The pear often does well in apple stocks, and generally does so in the quince and wild plum or shad bush.

But we would direct the attention of our farmers particularly to the cultivation of the grape.—The wild grape vine grows spontaneously almost every where. Many of the vines are barren, and a considerable portion of those that are not, yield fruit of but little value. These might be inoculated with kinds that are valuable, and thus rendered productive and profitable. The *Isabella* grape, a species recently introduced into New England from North Carolina, is found to combine in a remarkable degree, the excellence of the imported varieties with the hardihood of our native grape, and is altogether superior to the best of the latter kind. Those who cannot procure buds of the *Isabella*, may still make their barren vines productive, and improve those which bear the sour and inferior kinds of the common wild grape, by budding them with the white and pale red varieties, which may be procured in almost every town. *Worcester Spy.*

From the Worcester *Aegis*.

CULTIVATION OF THE GRAPE.

The cultivation of the Grape has become an interesting object of attention. The experiments which have been made, go far to show that the varieties suited to our climate may be made to flourish, and be productive of delicious fruits for the table, uniting the luscious coolness of the melon with the rich flavor of the peach and pear, at an expense not exceeding that of rearing the Indian corn. On a small scale, the vine may be trained over fences or buildings, to cover their sides with the deep verdure of its leaves, and wreath their summits with its graceful festoons.

Judging from personal knowledge and the statement of writers of approved judgement, we are induced to believe that inoculating grape vines is liable to some objections: among others to the following.

1. The operation would be difficult for those not very skillful in the use of the budding knife.
2. The vine from which the bud was cut would be destroyed by bleeding.
3. The stock into which the bud was inserted, would be killed from a similar cause.
4. The operation, if practicable with safety, would be comparatively useless: for the shoot sent out from the bud, if it should live, could not ripen so far as to bear the frost when the vine was left uncovered, or to resist decay, if sheltered during the winter.
5. It is decidedly the most difficult, dangerous, and ineffectual method of all devised for the propagation of the vine.

The vine is commonly propagated from seeds, layers, cuttings, or grafts; by seeds for the purpose of obtaining new varieties of delicious fruit; by layers to furnish strong and large plants the first year; by cuttings for vigorous and healthy vines and for the facility of the operation; and by grafting, in the early spring, into the root, below the surface, for the purpose of changing the character of the fruit.

The danger of making incisions in the vine at any other period, than when the frost has checked the circulation, is familiarly known to those who have had occasion to practise the mystery of pruning. The horizontal branches may be re-

moved when the main shoots are in vigorous growth; but cutting the part from which buds should be selected would sever the arteries of vegetable life, and soon relieve the gardener from further care of his plant. A reason as strong against the practice may be found in the fact, that if the buds are allowed to remain on the parent stalk until the wood is ripened, they may, at the season of pruning, be safely separated, and by covering with earth, converted into new vines with vigorous tops and sound roots.

The method of propagation, which is called that by *cuttings* is that recommended by the most experienced cultivators and judicious writers. Its advantages are, great economy of labor, increase of the number of plants, certainty of obtaining the same fruit with the original stock, convenience of cultivation, and the sure growth of healthy vines. In the autumn when pruning takes place, the shoots taken from the mature wood are cut off and separated in pieces. Some cultivators leave them eighteen inches long; others form them with only one eye on wood of one year old and a few inches of that of the preceding year; by a third method the cuttings have only a single bud. The cuttings thus prepared are preserved through the winter, by covering them with earth. In spring they are inserted so as to leave one or two buds above the ground, and freely send out shoots and fibres. This we believe is the easiest and best method known for propagating the vine.

THE VINE.

A number of gentlemen held a meeting in Baltimore, in June last, to form a society to promote the culture of the vine. Such is our opinion of the nature of their object, that we think there is scarcely any thing calculated to prove so useful to the country, as this undertaking, if successful.—They propose to hold fairs for the exhibition of wines, about the time of vintage. Dr Monkur delivered an address at the meeting, which contained some interesting facts about the culture of vines in the different climates of Europe, with a statement of the comparative degrees of latitude in the United States.—*N. Y. Statesman.*

HORTICULTURE.

A proper attention to the science of horticulture has ever been considered among the blessings of civilized life; and it may be observed, that the more any country has advanced in the knowledge of agriculture and gardening, the further that country has progressed in civilization. It is very evident, that in this country, where liberty seems to have made her abode, and the rights of man are protected, that great progress has been made within a few years in the science of agriculture. Societies have been formed under the auspices of some of our most enlightened citizens throughout the country—considerable progress has been made, and by universal opinion, an excitement to much greater improvement is anticipated. This spirit has also extended to horticulture;—and almost every man possessed of a small piece of ground, may display his elegant garden enriched with flowers and fruit, judiciously selected, so as to have a constant succession of nature's beautiful gifts; for a small garden well cultivated will produce much, and while it promotes health in the cultivation, must also afford pleasure from the time the blossoms first appear until the fruit arrives at maturity. But it must also be remarked

that to have flowers, fruits, and vegetables in perfection, they must be well attended; the ground kept clean from weeds by the hoe and rake, for nature is always the same, she will reward the industrious, but gives sparingly and almost refuses every thing to the negligent.

*Pater ipse colendi
Haud facilem esse viam voluit.*—*VIRGIL.*

From the Massachusetts Spy.

CANADA THISTLES.

Having seen several articles in your paper relating to the Canada thistle, and having had the satisfaction of destroying several bunches of them in a manner different from what I have seen described, I feel disposed to communicate it to the public. In 1822, I discovered the Canada thistle in a pasture where I kept about twenty sheep; I mowed them twice or three times in wet weather, but they appeared to grow the faster for it, and had, by the next spring, spread over three times as much ground as they occupied before, and were in a flourishing state. I caused them to be cut once more. I then took about two quarts of salt, and spread over the thistles, and the sheep being hungry for it, they very soon eat what they could, and continued upon the spot till they had stamped much of the grass and thistles into the dirt. I continued to throw on salt once or twice a week, for several months, and frequently put in other cattle, when they needed salt, so that the ground in a short time was almost bare, and what few thistles were to be seen were covered with rust. The next season I ploughed the ground, and have since planted and sowed it, and I believe there is now, not a single thistle on the piece. I discovered another bunch of them in another piece the next year, which I treated in the same manner, and have now on the ground a piece of corn, but have the satisfaction to say, there are no thistles in the field.

A FARMER.

LIGHTNING RODS.

Professor Fausher, of Yale College, says,—

"In a dry atmosphere its influence extends to from 30 to 40 feet.

In a damp do, from 20 to 25 feet.

When it rains profusely, from 15 to 20 feet.

From this statement it will be obvious that conductors should always be erected with reference to the most watery state of the atmosphere.

THE BIG WALNUT TREE.

This mammoth product of the American forest, which was exhibited in New York and Philadelphia, has been transported to London and sold for two hundred pounds sterling. It was found near Lake Erie, and measures 36 feet in circumference; its interior presents a splendid drawing-room.

APOPLEXY.

In giving the history of four classes of apoplexy, in which emetics appeared to have been exhibited with advantage, contrary to the general opinion of this practice being dangerous, Mr Swan takes occasion to remark, that apoplexy depends more frequently on the difficult transmission of blood through the lungs, or from its not being properly organized, than is imagined. A stomach overloaded by wholesome food, or containing a small quantity of indigestible food, deranges all the parts to which the *par vagum*, or eight pair of

nerves, are distributed, and therefore the lungs do not perform their functions; in which cases, tho' bleeding is absolutely required, the quantity of blood may be taken away without affording complete relief, and if there are no symptoms of paralysis, and it is probable that the stomach contains indigested food, it is advisable to give an emetic. *Edinburgh Journal.*

It has been estimated that the steam boats belonging to and trading from New York, consume during a running season of eight months, about 180,000 cords of pine wood, to which may be added 20,000 cords for other modes of consumption, making in all 200,000 cords. At Philadelphia, we have 12 boats besides ferries in constant use, which probably, with works and manufactories in the neighborhood and in New Jersey, use 150,000 cords per season, making an aggregate of the consumption of the two ports, 350,000 cords per annum. This vast destruction must, we apprehend, exhaust the lands within reach of navigable waters in the course of a few years, when a substitute must be resorted to, or the cost will be heavily increased. It is fair therefore to calculate, that the day is not far distant, when a demand for 175,000 to 200,000 tons of coal annually, for the use of steam boats, will be added to the coal market.—*Penn. Gazette.*

The State of Pennsylvania is going on with great power and rapidity with the canal. About 8 miles of her canal, that is from Pittsburgh to the northern turnpike, will be in successful operation, it is believed, in about three months; the residue, about 30 miles to the western base of the Alleghany mountains, will be put under contract on the 1st of September; and the rail road over the mountain, about 35 miles, will be under contract this fall, to be completed the next season.—The average number of hands employed this season has been above 4000, and the monthly disbursements of money, eighty or a hundred thousand dollars. The Pennsylvanians have reason to be proud of this great work, which they carry on in the only way in which important public improvements ever can be effected.—*Nat. Intell.*

From the number of milk-men I observed passing the Brooklyn Ferry, I was led to enquire the quantity of milk carried to the city each day from Brooklyn. I find it is 975 gallons, or 3900 quarts, which at 6d. is \$234 00 per day; \$1638 00 per week, and \$83,176 60 per year; and at a season when perhaps the least is used. I could not guess the extent of pasture it would require to supply such a viaducta, though.

A YANKEE.

E. Britton, Esq. of Little Falls, N. Y. has now, says the People's Friend, more than 300 swarms of bees. 200 of them young swarms, and doing well. This is making a business of honey-making.

A paper printed in the State of Alabama speaks of a most deplorable and alarming severity of young ladies. Every respectable female, native or stranger, found there, is, as soon as possible, hurried to the hymeneal altar. The young men are as 100 to one of the young ladies!!!

The steam boat, that runs between Aberdeen and London, is of 1000 tons, and 160 horse power. Steam boat excursions from London to sea take place weekly.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 1, 1828.

TAKING HONEY.

A writer for the American Farmer, vol. v. p. 72, gives the following description of a mode of taking honey adopted by a gentleman of his acquaintance. "He has no need of cap, mask, or gloves—so far from shielding himself, he rolls his sleeves up above his elbows, and goes at it when the sun is at its meridian, knowing that the bees are all at that time from home. The brighter the sun the better, and the month of August is his honey harvest. When he goes, at mid-day, he takes off the top of the hive, and takes out as much honey as he thinks proper—nails on the top, and goes on to another, and another, until he is done. The honey is as nice and white as it can be—the bees immediately fill up the vacant place, and the next year you have nice new honey again."

TO PRESERVE HAM, &c.

A writer in a Southern paper states that he has for more than twenty years past kept meat hanging up in his smoke house, through the summer season, and no fly, worm or bug has injured it.

"To prevent such injury about this time of year I take a strong ley made of wood ashes. I commonly boil it to make it stronger than it generally runs off; then I take my bacon and smoked beef, having two or three gallons of the ley in a large iron bottle, and take each piece of meat and dip it into the ley, so that it is completely wetted with it, then I let it dry—then I hang the meat in its former place. By this process I have invariably found that it kept the meat free from bugs and worms, and no taste of ley is ever perceived, even on the outside."

DR. COOPER'S AXIOMS IN FARMING.

1. Two crops of grain should not succeed each other; they should be separated by potatoes, clover, grass, turnips, beets, or carrots for fall feeding.

2. Good agriculture requires no naked fallows; fallow crops [any beed crops] that compel you to keep the ground clean while they are growing, answer the purpose.

3. Manure once in four years.

BRAKES.

A friend in Andover informs us that common brakes can be destroyed effectually, by pulling them up by the roots, in the month of June, when their roots are short, and they start very easily.—It may be necessary, in some cases, to go through the process the second year, though they seldom require this trouble.

LUXURIANT GROWTH.

Mr. J. W. Warren, of Weston, has left several spires of Timothy or Herds-grass, at the office of the New England Farmer, measuring five feet three inches in length; the heads of which measure between nine and ten inches.

GARLICK.

A writer in a Philadelphia paper states that when the full fever raged violently in the neighborhood of a canal, then in a state of progress, numbers of the workmen engaged on it eat plentifully of garlick, and wholly escaped, while those who abstained from the use of this article were severely afflicted by the disorder.

William Prince, Esq. Proprietor of the Linnæan Botanic Garden, near New York, and his sons Mr William Robert Prince and Alfred Stratton Prince, have each been elected members of the Paris Horticultural Society, which is now progressing in its operations with the greatest success, and has already published nine numbers of its Transactions. Triplicate copies of these works have been transmitted to the gentlemen above named by the Chevalier Soulangue Bodin, who has been appointed Secretary of the Society; and one copy has been presented by the Mess. Princes to the Hon. JOHN LOWELL of Roxbury.

FINE FRUIT.

Scotch Gooseberries measuring four and a half inches in circumference, picked a few weeks since from the bushes, can be seen at the New England Farmer Seed store, preserved. They are of the same kind of those advertised and sold at this place last spring. Likewise white and red Dutch Currants one inch in circumference, bushes of which will be for sale at this place the ensuing autumn and spring.

CLOVER—Query.

It has been suggested by a German farmer that in Holland, in an unfavorable season for making hay, it is customary to put down clover, green salted, in vats. It is eaten with avidity by cattle, during the winter. A correspondent in Salem wishes to know if any thing similar has ever been adopted in this country?

THE BEE MILLER.

The following method of destroying a very pernicious insect has been recommended, and is at least worth the trial. To a pint of sweetened water (sweetened with sugar or honey) add half a gill of vinegar; set this in an open vessel on the top of the hive, and at night, when the miller comes to his work of destruction, he will prefer this composition, and, diving into it, immediately drown.

Extract from a letter to the Editor of the New England Farmer, dated Brownsville, N. Y. July 20, 1828.

THE SEASON.

This has been the wettest season remembered in this part of the country. Our wheat for many miles around is badly rusted, so that we shall not get half a crop. The price of wheat for several years, has been with us from fifty to seventy-five cents per bushel; it is already a dollar, and instead of sending a large supply to the New York market, we shall not raise enough for our own consumption. Our hay crop is very good, but we have difficulty in harvesting it without damage from rain.

CULTURE OF HOPS.

The New Brunswick Courier, in recommending the culture of Hops in that province, as an article of export, gives the following information respecting the best mode of gathering, drying and bagging, which we copy for the benefit of our agricultural readers.

As the culture of the hop plant concerns the individual who follows it, as a means of living, more than those who could, from convenience, and other local circumstances, render it an item of profitable domestic produce, our observations at this time, are confined to preparing it for a market, under the different heads of gathering, drying, and bagging.

No specific time can, in this country, where, on account of the variety of its soil and climate, vegetation is more or less rapid, in different parts, and also in different seasons, be fixed upon for the gathering, or picking of hops:—good judgement, and experience, therefore, are the surest guides to be followed. Their ripeness is to be ascertained, by their strong scent, their hardness, and the brownish colour of their seed. When they arrive at this state of maturity, no time should be lost in having them expeditiously picked, as in the event of a heavy rain falling, they would be bruised and discolored, and thus rendered less valuable in the market, than such as are picked, bright and clear. Special care ought to be observed, also, to pick the hops when they are dry, and the weather fair.

The drying of the hops is the next part of the process to be attended to. After having been picked, they ought to be immediately carried to the oast or kiln. This building is similar in its construction to a brick-lay'd kiln, for the drying of oats; only, that the floor is overlaid with a covering of hair cloth. The oast, previous to the hops being laid upon it, ought to be moderately heated by a fire of charcoal, and the heat not suffered to be diminished, during the course of drying, but rather increased. The hops are to be laid on, a foot, or a little more, thick, and allowed to remain, without being turned, for the space of nine hours, and in two or three hours afterwards, they will be fit for bagging. This may be ascertained by the brittleness of the stalks, and the easy falling off of the hop leaves. The turning of the hops at all, is considered to be injurious rather than otherwise; to prevent this, therefore, oasts ought, where hop-curing is carried on upon an extensive scale, to be furnished with a moveable tin cover, let down to within a foot of the surface of the hops,—this will render the oast close, and the heat will be reflected upon the hops, in nearly an equal degree, on the top as at the bottom.

The mode of bagging is simple, and can be managed to suit convenience, and particular circumstances. It ought to be attended to, immediately on the hops being removed from the oast, and put into strong coarse linen bags; the bags must be placed in such a situation, as to admit of persons stepping into them, in order to tread the hops down, as they are gradually put in. Thus put up, they will keep for several years, provided they be lodged in a dry place, and defended from the ravages of vermin.

IMPROVEMENT IN VEGETABLES.

There is scarcely a vegetable which we at present employ that can be found growing naturally. Buffon states that our wheat is a factitious production, raised to its present condition by the art of Agriculture. Rice, rye, barley, or even oats, are not to be found wild, that is to say, growing naturally in any part of the earth, but have been altered by the industry of mankind, from plants not now resembling them even in such a degree as to enable us to recognise the relations. The acid and disagreeable *apium graveolens* has been thus transformed into delicious celery; and the *colewort* a plant of scanty leaves, not weighing altogether half an ounce, has been improved into cabbage, whose leaves alone weigh many pounds, or into a cauliflower of considerable dimensions, being only the embryo of a few buds, which, in the natural state, would not have weighed many grains. The potato, again, whose introduction has added ma-

ny millions to our population, derives its origin from a small bitter root, which grows wild at Chili and at Montevideo. If any of my readers should be sceptical upon the subject of such metamorphoses, let them visit the fairy bowers of horticulture, and they will there perceive that her magic wand has not only converted the tough, cariacaceous covering of the almond into the soft and melting flesh of the peach, but that, by her spells, the sour sloe has ripened into the delicious plum, and the austere crab of our woods into the golden pippin; that this, again, has been made to sport in almost endless variety, emulating in beauty of form and color, in exuberance of fertility, and in richness of flavor, the rarer production of warmer regions and more propitious climates.—*Dr. Paris on diet.*

COOKING POTATOS.

Of all the good things which nature produces, through the patient industry of the farmers, there is nothing which is so agreeable to the palate as the potato, nor any one vegetable so universally esteemed, yet this is so frequently rendered unpalatable by the manner of cooking it, that but comparatively few are acquainted with the real flavor of this esculent root. Lovers of mealy potatoes will do well to attend to the following method, communicated to us by a lady of this town, whereby potatoes a year old may be rendered as delicious as new ones boiled in the common manner. Peel them, put them into cold water, and let them remain two or three hours; then boil them in water which has been salted, observing that it boils when they are put in; pour off the water when they are done, shake them well for a short time, put them on the fire again, and at the expiration of ten or fifteen minutes, they will be ready for the table.—*LANCASTER GAZETTE.*

We continue to be visited with frequent and severe thunder storms. The storm which passed us on Saturday morning was severely felt to the north, at New Ipswich, Ashby, Fitzwilliam, &c.—We are informed that three horses in one stable were killed by lightning in Fitzwilliam, and that a man in the act of cleaning one of the horses was struck down and somewhat injured at the same time. Two hogs were also killed in Ashby.—The storm of Sunday night, which was severe but of very short duration here, was felt with extreme severity in the towns abovementioned.—*Ibid.*

SILK.

According to the latest accounts from the southern countries of Europe, where silk is a principal object of trade, all the silk-worms are in a thriving condition, and promise an abundant crop. In Smyrna, Broussa, and other parts of Asia Minor, no fears are entertained for this year's supply.

The Coffee Crop in Hayti is said to have fallen short. This is a great calamity, as the Government and People depend almost entirely upon it.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D." Boston, through the post-office. 6t Aug. 1

Wanted.

A young man is wanted, to attend to the sales of a Milk Establishment, who can produce the most undoubted recommendations—none other need apply. Liberal wages will be given. Apply at the New England Farmer Seed Store, No. 52 North Market-street.

German Geese.

For sale, two pairs of this superior breed of Geese, from East Friesland, Germany—produced from a pair imported last year direct from Bremen, in ship North America, Capt. Child; and which were selected by said Capt. himself, with the greatest care. These geese possess many important qualities peculiar to their breed—among which is, their size, their usual weight when fat being from 25 to 30 pounds each—also the large quantity of feathers which they yield, the Germans pluck them three times a year, and the feathers are considered the best in the German, English and Dutch markets—and their remarkably docile, gentle and domestic dispositions. Apply to Capt. S. P. Child, Warren R. I. where the geese are to be seen—or to Wm. B. Bradford, Jr. No. 24 India street, head of Central wharf, Boston—or to the New England Farmer Seed Store. July 18 3t

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturalists in the vicinity of Boston and New York, is just published by J. B. RUSSELL, Proprietor of the New England Farmer. The articles are arranged alphabetically, and comprise the most useful VEGETABLES and FRUITS which can be conveniently and economically cultivated in the climate of New England and the Middle States; as well as a Treatise on FLOWERS, and on LANDSCAPE or PICTURESCUE GARDENS, on the general management of the SILK WORM, and the manufacture of SILK, and a Treatise on the culture of GRAPE VINES and the STRAWBERRY. The article on Fruit Trees contains an enumeration and description of all the Apples, Pears, Peaches, Cherries, Plums, Nectarines, Apricots, &c. &c. that can be raised to the most advantage, and their relative forwardness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written.

The following is the General Index of the book, which is superadded to a Calendrical Index, giving directions for performing the work of all the months in the year as they follow in succession.

Apple	Elecampane	Mulberry
Apple tree	Endive	Mushroom
Apricot	Esphalers	Mustard
Artichoke	Fennel	Nectarine
Asparagus	FLOWERS, ORNAMENTAL	Nursery
Balm	FRUITS	Oak
Barley	FRUIT TREES	Okra
Bean	Garlick	Onion
Beet	Gooseberry	Orchard
Beet plant	Gourd	Parsley
Borecole	Grafting	Parsnip
Borer	Green house	Pea
Broccoli	Hawthorn	Peach tree
Brussels sprouts	Heading down	Pear tree
Buckthorn	Hedges	Pepper
Cabbage	Hoening	Plum tree
Canker worm	Horse Radish	Potato
Caraway	Hot bed	Pumpkin
Cardoon	Hot house	Quince
Carrot	Hyssop	Radish
Caterpillar	Inarching	Rhubarb
Cauliflower	Indian corn	Roller
Celery	Inoculation, or bud-	Rose
Chamomile	ding	Rosemary
Cherry tree	Insects	Rue
Chervil	Jerusalem Artichoke	Sage
Chive	LANDSCAPE AND	Salsify
Colewort	PICTURESQUE	Savory
Coriander	GARDENS	Sea kale
Cress, water	Lavender	SILK
Cress, garden	Layers	Skinnet
Cucumber	Leaves	Spinach
Curculio	Leek	Squash
Currant	Lettuce	STRAWBERRY
Cuttings	Locust tree	Tansy
Dandelion	Love apple	Tarragon
Dibble	Madder	Tensel
Drains	Mangel Wurtzel	Thyme
Druck	Marjoram	Tomato
Egg plant	Melon	Turnip
Elder	Mint	VINE.

In addition to the above, the work contains a variety of articles on Domestic Wines from the Red and Black Currant, Gooseberries, Elder Berries, &c. jellies from fruits, preservation of fruits, &c. and many other articles on domestic economy, which will make the work desirable in families. It is handsomely printed, and makes a volume of 312 pages.

Any person who will obtain subscribers for, or engage five copies, and forward \$6.00 as payment in full, shall have a sixth copy gratis, for his trouble.

Imported Cow for Sale.

For sale, an Imported Short Horned Durham Cow, and Bull Calf, three weeks old, from the Coelebs stock, of remarkable good size and form; color red and white, handsomely mixed. The last year's Calf (a heifer) from the same Cow obtained a premium at the Brighton Cattle Show in October last. Inquire at the office of the New England Farmer

Barefoot and Serab.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Coffin, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Barefoot, a chestnut horse, is as follows.

FOALD 1820.

Barefoot, by Trump, dam Rosamond by Buzzard, out of Rosberry, sister to Huley and Tartar, by Phenomenon, out of Miss West by Matcham—Regulus—Crah—Chadders—Bastid.

In 1821, when at Pontefract, sweepstakes of 20 gs. each, for two years olds—11 subs.—Barefoot beating Harpington.

In 1823, York Springs St. Ledger, of 25 gs. each, 6 subs.—Barefoot beating four others.—A. Pontefract sweepstakes of 20 guineas each ten feet, 10 subscribers.—Barefoot beating Palatine.

In 1823, the Doncaster great St. Ledgers, of 25 gs. each, 30 subscribers.—Barefoot beating 11 others.

In 1823, at New Market, Barefoot won a handicap plate value £50, beating Tressilian and five others.

In 1821, at Ascot Heath, Barefoot walked over for the Swinlas stakes, of 25 sovereigns each 3 subs.

In 1825, at Lancaster, the gold cup, value 10 gs. added to a sweepstakes of 10 sovereigns, 17 subs. of all ages.—Barefoot beating Lottery and two others.

In 1826, at Manchester, Handicap stakes of 20 sovereigns each, 10 ft. with 20 sovereigns added—6 subscribers.—Barefoot beating two others. At Lancaster, the gold cup, value 100 gs. added to a sweepstakes of 10 sovereigns each, 9 subs.—Barefoot beating two others.

SERAB, (a beautiful bay Horse.) FOALD IN 1821. Got by Phinotum out of Jesse, by Tooteridge—her dam Creeker by Highblyer, out of Nutcracker, by Matesum.

In 1821, won the New Market stakes, 50 gs. each, 21 subs.—Serab beating four others.

In 1825, at the New Market Crane meeting, the stakes, 100 sovereigns, 7 subs. Serab leading two others. The same year, Spring meeting, Serab won Handicap sweepstakes, 100 sovereigns, 6 subs. beating three others.

In 1826, Serab won Kings Plate, 100 gs. beating 30 other. In 1827, Stocton, Serab won the gold cup. 113

MISCELLANIES.

RECORDS OF WOMAN.

BY MRS. HEMANS.

The following is the picture of Gertrude von der Wart, whose devotedness to her husband on the rack is well known.

Her hands were clasp'd, her dark eyes raised,

The breeze threw back her hair;

Up to the fearful wheel she gazed—

All that she loved was there.

The night was round her clear and cold,

'The holy heaven above,

Its pale stars waiting to behold

'The night of earthly love.

"And bid me not depart," she cried

"My Rudolph, say not so!

This is no time to quit thy side;

Peace, peace, I cannot go.

Hath the world ought for me to fear

When death is on thy brow?

The world! what means it?—mine is here—

I will not leave thee now.

I have been with thee in thine hour

Of glory and of bliss;

Doubt not in memory's living power

To strengthen me through this!

And thou, mine honor'd love and true

Bear on, bear nobly on!

We have the blessed heaven in view

Whose rest shall soon be won!"

And were not these high words to flow

From woman's breaking heart?

Thro' all that night of bitterest woe

She bore her lofty part;

But oh! with such a glazing eye

With such a curdled cheek—

Love, love! of mortal agony.

Then, only *then* should'st speak!

The wind rose high—but with it rose

Her voice, that he might hear;

Perchance that dark hour brought repose

To happy bosoms near,

While she sat striving with despair

Beside his tortured form.

And pouring her deep soul in prayer

Forth on the rushing storm.

She ward the death-damps from his brow

With her pale hands and soft

Whose touch upon the lute chords low

Had stilled his heart so oft.

She spread her mantle o'er his breast

She bath'd his lips with dew.

And on his cheek such kisses press'd!

As hope and joy ne'er knew

Oh! lovely ate ye, love and faith,

Enduring to the last!

She had her need—one so dear in death—

And his worn spirit pass'd.

While eyes as o'er a martyr's grave

She knelt in that sad spot.

And, weeping, bless'd the God who gave

Strength to forsake it not!"

"The Emperor of China has prohibited the filth used for smoking," from being imported into the celebrated empire.

A worthy knight and citizen was asked, a few days ago, to explain the term *statu quo*, which he did in the following manner:—"Why, *statu quo*—*statu quo* belongs to the fine arts—you all know what *co* is—*co* is latin for *company*, as we see it marked, you know Barclay & Co. Menz & Co.—whenever it is more than one it is always *co*. But

I will describe it to you—you know what a statue is—well, a statue by itself is nothing more than a *statu*, but when there is more than one statue, as, for instance in the case of Gog and Magog at Guildhall, or the men at St. Dunstan's, why then that is statue and *co*.—that is the latin *statu quo*."

From the Zion's Herald.

ANCIENT BURYING GROUND.

While at Pittsburg, Penn. in May, the Rev. Mr. Gwinn, an aged and respectable member of the general conference, related to me some circumstances respecting ancient burying grounds, in the section of the country in which he resides, which appeared to me of an interesting character. Having a desire to retain the facts, he very kindly gave them to me in writing; with permission to make any use of them I pleased. My informant said that he had examined those grave-yards himself, and could attest to what he had written—the substance of which I forward for your insertion in the Herald, if you think it worthy a place.

New Bedford, June 26, 1828. J. SANBORN.

"In the county of White, State of Tennessee, near the town of Sparta, there have been discovered three burying grounds, where a very small people are deposited in tombs (coffins) of stone.—The greatest length of the skeletons is *nineteen* inches. Some of these people appear to have lived to a great age—their teeth being worn smooth and short, while others are full and long. Many of the tombs (graves) have been opened, and the skeletons examined. The graves are about two feet deep; the coffins are of stone, made by laying a flat stone at the bottom, one at each side, one at each end, and one over the corpse. The dead are all buried with their heads to the east and in order, laid on their backs and their hands on their breasts. In the bend of the left arm is found a cruise or mug, that would hold nearly a pint, made of ground stone, or shell of a gray color, in which is found one, two, or three shells, supposed to be sea shells. One of these skeletons had about the neck 94 pearl beads. There are many of these burying grounds. Near the one which I examined is the appearance of an ancient town. The bones found in these graves are strong and well set, and the whole frame appears to be well formed. These grave-yards are in extent from half an acre to an acre and an half.

In the same neighborhood is a burying ground where the dead are buried in the same manner as above described, and where the skeletons are from *seven to nine feet long*."

Childhood.—There is in childhood a holy ignorance—a beautiful credulity—a sort of sanctity, that one cannot contemplate without something of the reverential feelings with which one should approach beings of celestial nature. The impress of the divine nature is, as it were, fresh on the infant spirit—fresh and unsullied by contact with this withering world. One trembles, lest an impure breath should dim the clearness of its bright mirror. And how perpetually must those who are in the habit of contemplating childhood—of studying the characters of little children, feel and repeat to their own hearts—"Of such is the Kingdom of heaven!"—Aye, which of us, of the wisest among us, may not stoop to receive instruction and rebuke from the character of a little child?—Which of us, by comparison with his divine sim-

licity, has not reason to blush for the littleness, the insincerity, the worldliness, the degeneracy, of his own.

Genius and Feeling.—Nobody possessed of common sense or common sensibility would offer consolation to one who had just lost a beloved wife. Sympathy is the only thing that the case will admit of. The subjoined letter is not excelled, perhaps is not equalled, by any similar effusion.—The very peculiar circumstances under which it was written might have deterred a friend less anxious, or a writer less confident in the expression of what he felt than Mr Gray.—*Charleston Courier.*

MR GRAY TO MR MASON.

"I break in upon you at a moment when we least of all are permitted to disturb our friends only to say that you are daily and hourly present to my thoughts. If the worst be not yet, you will neglect and pardon me; but if the last struggle be over,—if the object of your long anxieties be no longer sensible to your own sufferings, allow me, at least in idea, (for what could I do, were I present, more than this?) to sit by you in silence, and pity from my heart, not her who is at rest, but you who lose her.

"May he who made and he who afflicts us, the Master of our pleasures and of our pains, support you!—Adieu.

"I have long understood how little you had to hope."

It need scarcely be added that the amiable woman whose extreme illness prompted Mr. Gray's anxious inquiry, was she whom her husband has immortalized (so long at least, as English poetry shall endure) in the exquisite inscription on her monument in the Cathedral of Bristol.

"Take, holy earth, all that my soul held dear." &c.

Turnip Seed, &c.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, Boston, an extensive assortment of Turnip Seeds, some of which are the growth of the present season—the finest sorts either for family use or stock. The most improved sorts for the former are the White Stone, White Dutch, Yellow Stone, Yellow Malta. The *Yellow Stone* is one of uncommon excellence and keeps well. Of the sorts for field culture, the White Norfolk, White Globe, and *Yellow Aberdeen* or *Bullock* are preferable. The *Yellow Aberdeen* is most approved among the farmers of England and Scotland, as it grows to a large size, is very sweet and nutritious, and keeps till June. Also, *Yellow Ruta Baga*, or Russian Turnip, of the best description. The above seeds were saved in Europe expressly for us, and the utmost dependence may be placed upon their genuine quality. A variety of Long and Turnip Radishes, suitable for growing the three ensuing months. Prickly or Fall Spinach, Long Prickly and Early Cluster Cucumber; also the genuine Ginkin Cucumber, or West India pickling one of the finest pickles.

Likewise 200 lbs. fresh common white flat English Turnip Seed, a part of the growth of 1828;—to dealers and purchasers by the quantity, it will be put at a low rate.

Oat Meal, Oat Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine boiled Oat Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few canisters of fine Oat Flour, neatly packed, at 50 cts. per canister.

Seeds for the West Indies.

Merchants, naval vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden. Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

FARMERS' WINTER EVENINGS.

No class of the community have more leisure during the evenings of winter, than practical farmers; and it may, perhaps, be a question worthy their consideration, whether those living in the same neighborhood, can enter into any arrangement, to appropriate a portion of this leisure time, to aiding each other, in the cultivation of their social, intellectual and moral faculties, or in the skill and success of their important and dignified employment.

The instruction and pleasure received by myself, a winter or two since, at weekly meetings with a few practical farmers, are fresh in my recollection; and two volumes of notes taken from statements of the observation and experience of the various members of the association, still remain, as satisfactory proof, that social, intellectual and moral improvement, was not the only advantage derived from the meetings, but that much practical instruction was received by all who attended them.

If I understand the object of a few articles of association, entitled "American Lyceum," published in your last number, it is to furnish farmers and others, with an opportunity to aid each other by reading, communications, and discussions upon subjects relating to their professions. Indeed it is well known that those branches of the Lyceum, already in operation, have had many *practical* and interesting discussions and communications, both upon agriculture and the mechanical arts, as well as the other various relations of human society.

It is hoped that farmers in every town in New England at least, will give the subject an early and serious consideration; and that many will be induced to make arrangements, to devote a few evenings of the approaching autumn and winter, to the benevolent and dignified object of aiding each other in the improvement of their minds, their hearts, and their farms.

On a future occasion I may ask a place in your paper for a few practical questions upon agriculture, as proper for discussion at social meetings.

FRANKLIN.

FOR THE NEW ENGLAND FARMER.

STACKING HAY.

MR. FESSENDEN—Perhaps it may prove beneficial to communicate to the public a mode of stacking which has been put in practice in this town. A foundation being laid adjoining the side of a barn, proceed to mow up the hay in a square or oblong body, quite to the eaves on the barn, on the inner side of the mow or stack; and on the outer side to such height as to give a proper descent. Drive into the plate three or more hooks, directly under the gutter. Lay on the outer side of the stack a joist to support the rafters, which should be of sufficient length to reach from the hooks (with which they are connected by plate hinges riveted on the inner side) to the outer edge of the stack; the rafters to be covered with boards, laid on clapboard fashion. This roof may

be raised and lowered for the purpose of putting in and taking out hay, and will effectually secure the top of the stack from wind and rain.

BORCHESTER.

FOR THE NEW ENGLAND FARMER.

DESTROY THISTLES.

MR. FESSENDEN,—I was pleased to observe in your last, the subject of the Canada thistle again brought to view. I allude to the piece signed "a farmer," from the Massachusetts Spy. [page 13 of the current volume.] I have no doubt of the efficacy of salt, or strong brine, in destroying this worst of all pestiferous weeds. I destroyed the most of what few I found on my farm last year, with some refuse beef brine, without the trouble of cropping them down; though I think it best to crop them, even under ground. Indeed the cropping or cutting down, should be attended to before this time of the year, if nothing more is done; in order to prevent their spreading. Its downy seeds are now in this vicinity wafted about in the air by every wind—they just begin to be let loose, and will propagate far and wide. It is matter of astonishment, that so little attention is paid to the subject. Farmers were informed several years ago, of the efficacy of the above method of destroying the thistle, or one quite similar, in vol. ii. p. 411 of the New England Farmer, and yet they still neglect to make use of it.* I understand some proposals have been made in our State Legislature on the subject; perhaps that body may think it a subject worthy their attention. But much might be done by individuals, if all would be awakened to a sense of its importance.

Salt, that has been used for salting imported hides, and for salting the bottoms of vessels may sometimes be purchased for a trifle; and farmers may be assured that if applied, it will destroy thistles, as well as any other tree or plant.

Lynn, Aug. 4, 1828.

A FARMER.

* The following is an extract from the passage alluded to: "Cut off each thistle about half an inch below the surface of the ground, and then put on it a gill of coarse salt. Fish brine may be used instead of salt, and will answer the same purpose. If in a bed of these thistles, a few should escape the first year, the above operation should be carefully performed on them the year following. The summer season, when the thistles are in full growth, is the proper time for doing this business."

THE SEASON.

Extract of a letter to the Editor of the New England Farmer, dated Florida, N. Y. July 29, 1828.

We have had a very favorable season, our crops of all kind are good. Barley (our staple produce) is remarkably fine, and is now going rapidly into our barns. Our meadows were never better, and our fields of Indian corn are luxuriant—while our gardens please the eye, and contribute an abundant supply for the kitchen.

Preventive against moths.—Calamue, or sweet flag root cut in thin slices and scattered among woolens of any kind, will effectually repel the assault of this destructive insect.

AUGUST.

From the middle of August to the middle of September is said to be the best time for sowing winter rye. By sowing early you provide green food for sheep late in the fall and early in the spring, and by early sowing, and feeding in the fall the roots of the grain take such firm and extensive hold of the soil that they are less liable to be thrown out of the ground by frost, or winter-killed. When sowed so early three pecks of seed will be sufficient. Preserve your sheep from the gad-fly, which causes worms in the head, by keeping their noses continually smeared with tar from the middle of August to the latter part of September. If you mix a little fine salt with tar, and place it under cover where your sheep can have access to it no doubt they would keep their noses sufficiently smeared with tar to prevent the troublesome assidues of the buzzing belligerent, who so often plants the seeds of death in the nostrils of one of the most useful and inoffensive of the four-footed friends of the farmer.—*New England Farmer's Almanac.*

HORN SHAVINGS.

Horn chips and shavings can be procured in considerable quantities wherever the manufacture of combs is extensively carried on. They are admirably prepared for the purposes of manure, either for land under tillage or as a top dressing for grass grounds, and when judiciously applied in either case, they have seldom if ever failed to make a rich corn. As a manure for potatoes and corn they are found valuable; when applied to either at the time of hilling, covering them with the soil, the good effects are immediately perceptible. The application of fifty bushels to the acre at the time of seeding a field of rye, in the autumn, would much improve the crop, and much more improve the land, if to be laid down to grass. It has been thought, that laying in a dry sandy soil, under grass, in a dry season, was injurious; it is probable, under such circumstances, the crop was not benefited, but if there was enough grass to cover the shavings from the scorching sun, the succeeding crop would be materially increased by the application. But a situation in which there is no doubt of their efficacy, is, strong moist land under grass, the improvement of the crop from the first is very visible, and it continues for years. It is a warm, stimulating, permanent manure, and were it within reach of the generality of farmers, more might be said to encourage them to use it. Let any one who has the opportunity make the trial of it, and he will hardly fail to discover its value. The usual price is about ten cents per bushel.—*Notes to Davy's Agric. Chem.*

TURNIPS.

In Kent's Hints, page 128, is the following on turnips.—In crops they answer three great purposes; to *clean the ground*; to *support live stock*, a vast deal; and *prepare for other crops*; particularly for barley and clover, or grass-seeds. The turnip crop is the Norfolkman's sheet anchor; and he spares it no pains. The stubble of wheat, barley, or oats, is preferred for bringing on turnips. They plough very shallow; so as to skim off the rough sur-

face only, some time before Christmas. In the following *March* it is well harrowed (their soil is a sandy loam) and then is cross ploughed to its full depth. In *May*, it is ploughed again, the same depth, and if dry weather and the soil stiff, immediately harrow after this ploughing. By the first of *June*, it ought to be perfectly clean. Now, 10 good cart loads of manure are laid on an acre, regularly spread, and ploughed in quite fresh, half the depth of the other ploughing.—It thus is left till about the 21st. of *June*; and then is well harrowed, to blend the soil and earth together.—It is then ploughed to its full depth, and harrowed, once only, the way it is ploughed. The seed is then immediately sown, on the fresh earth; * not even waiting for the ploughing a second ridge. A quart of seed an acre is sown. The seed is harrowed in twice, the same way the ground was ploughed. The harrow is short tined, and the lighter the better.

The nicest part of the turnip husbandry now remains to be observed: It is *hoeing*; without which all the former labor is thrown away.—When the plants cover three inches in diameter, hoe them with a 10 inch hoe; and set them at 15 inches apart; without regard to the apparent health in the choice of those left. About 10 or at most 14 days after the first hoeing, the ground is hoed a second time, so as to stir the mould effectually between the plants, and to check weeds.—About 14 or 20 days after the 29th. September, the turnips are fit for consumption, and so to April, unless frost injures them.—Where the land is wet the whole are drawn, and fed in cribs. On light dry land, every other ridge is drawn.

He adds, 20 acres of a good crop of turnips fatten 15 or 16 bullocks, and support 10 followers or store cattle for 25 weeks; or of sheep, as 8 to 1 bullock. But the greatest advantage is in *cleaning, meliorating and preparing* the soil for other crops.

To save turnips in the field, they sink some beds in the ground where they grew, about two feet deep, of a considerable width, and lay 5 or 6 layers of turnips in them, one upon another, with a little fresh earth between two layers, and cover the top over with straw, to keep out the frost. Or pile them up in small stacks, with the greens outward, and a little clean straw between every two layers; and lastly cover or screen them with wattles lined with straw.†

* In Maryland, turnip seed is usually sown a full month later than this.

† At Wye, with intention to try a new mode, my turnips were sown in broad-cast, thick. A plough having a narrow fin without its mould board, was run through the young plants, carefully, for leaving them on a narrow slip of earth. Handhoes followed, working across the rows, and cutting near a foot width of the plants quite up; the hoers stopping occasionally to thin the clusters of turnips left by the hoers. A double mould board plough afterwards run through the intervals, heaves up the earth on each side and leaves the plants on clean ridges. Advantageous as this proved, I could not procure it to be repeated more than once more, a few years afterwards. Overseers are as fixed to old habits as the negroes under them; and I was much abroad on other business. I have indeed always found the negroes better disposed to execute my designs, than the overseers, who invariably are attentive and ingenious in taking short cuts for slurring over all work, to soon get rid of it and go a frolicking. I usually sowed near the end of July though I felt disposed to break through the practice; and sow a little later, for saving them before they were old in growth when they incline to be open and spongy, and therefore do not keep so well as younger turnips, close and in full vigor. In that country turnips are but little hoed and that slovenly. and to thin the plants the country

KITCHEN GARDEN—AUGUST.

Several crops are to be sowed this month for winter and the next spring and early summer crops; as cabbages, cauliflowers, onions, earrots, spinach, and some principal crops planted for late autumn and winter supplies. In this month, digging vacant ground is required for sowing and planting several fall crops. All new planted articles must be watered, and diligent attention paid to the destruction of the weeds before they grow large, or come to seed.

Asparagus, which will be now all run to seed, must be kept clean from weeds, which is all the culture they will require till October or November, then to have their winter dressing.

Sow cauliflower seed about the latter end of the month, to stand the winter, in frames, hand-glasses and warm borders, for the early and general summer crop, next year; and for which remark the above time, for if the seed is sown earlier, they will button or run in winter; and if later, they will not attain due strength before that season. If the weather is dry, occasionally water them, and let them be shaded from the mid-day sun.

Earth up the former planted crops of celery, repeating it every week according as the plants advance in growth. Do it moderately on both sides the rows, but be careful not to clog up the hearts.

Cucumbers in frames, &c. may now be fully exposed by removing the glasses. Picklers, or these in the open ground, will now be in full perfection. Gather those for pickling while young two or three times a week. While the weather continues hot, daily water the plants.

In dry weather hoe various crops in rows, to kill weeds, loosening the earth about, and drawing some of the stems of the plants, to encourage their growth.

Sow cos. cabbage, and Silesia and brown Dutch lettuce, in the beginning and middle of the month; and towards the latter end for successional crops the same autumn, and for winter supply, and to stand the winter for early spring and summer use. Plant and thin lettuces of former sowings a foot distant.

Onions being now full bulbed, and come to their mature growth, should be pulled up in dry weather, and spread in the full sun to dry and harden, for a week or a fortnight, frequently turning them to ripen and harden equally for keeping. Then clear them from the gross part of the stalks and leaves, bottom fibres, any loose outer skins, earth &c. and then house them on a dry day.

Sow winter onions both of the common bulbing and Strasburg kind, for the main crops to stand the winter to draw young and green, some for use

people think would be destroying what they had done. They count the turnips by the number of plants, rather than by the quantity of the roots.

Turnips in rows, having 12 or 14 inch intervals. Every other row taken up and saved, would leave intervals 24 to 28 inches wide. Cover the remaining turnips with long dung; then in November, before the frost sets in, dig deep a double mould board plough, and heave the earth on the turnips, to stand the winter. Make the experiment. Such a plough is highly valuable on many occasions. It especially saves 2 or 3 boats in clearing out, when ploughing maize. Of potatoes every other row taken up would leave 3 feet intervals between the rows of remaining potatoes. The haulm cut off and laid on these potatoes, may then be covered by the earth heaped on them by a stout double mould board plough; for keeping this half of the crop through the winter. It may be first tried in a few rows,

in that season, but principally for spring supply; and some of the common onions also to stand for early bulbing in summer. The common onion is mildest to eat, but more liable to be cut off by the frost than the Strasburg onion. This never bulbs and is of a stronger hot taste than the other, but so hardly as to stand the severest frost. The White Portugal Onion is the finest sort for fall sowing.

Potatoes may now be dug up for use in larger supplies than last month, but principally only as wanted, for they will not yet keep good long, from their not having attained their full growth.

Sow an autumn crop of Radishes, both of the common short top and salmon kind. Likewise turnip radish, both of the small white, and the red, for autumn, and the principal crop of black Spanish for winter; and hoe the last sown to six inches distance.

Sow the prickly-seeded, or triangular-leaved spinach, for the main winter crop, and for next spring that sort being the hardiest to stand the winter.—Sow some in the beginning and some towards the latter end of the month, each in dry-lying rich ground exposed to the winter sun.

Hoe the last sowed turnips eight inches distant in the garden crop; but large sorts, in fields or extensive grounds, must be thinned ten or twelve inches or more.

Be particularly attentive to gather all seed that are ripe before they disseminate. Many sorts will now be in perfection; you must therefore cut or pull up the stalks, bearing the seed, and lay them in the sun to dry, &c. as directed in July.

MODE OF PRESERVING POTATOES.

The following process for preserving potatoes has been recommended by an English writer, which he states "will preserve all the nutritious parts of this valuable root for years."

"Let the potatoes be particularly well washed, then put into the cider mill and ground to a perfect pulp; put this pulp under a powerful press, (in hair cloths, as in cider making), and press it as dry as possible: then take it from the press, and put it upon the hop kiln, and carefully and well dry it; and then let it be packed in casks, or kept in any other manner, so that it be always preserved in a completely dry state."

KELP, OR CRUDE SODA.

[Concluded from last week.]

France was in the habit of depending principally upon foreign countries, for the supply of crude sodas, until the period of the revolution. In consequence of the wars lighted up by that event, she found herself cut off from the rest of Europe, and compelled either to abandon some of her most important manufactures, or to find within herself the means of supplying the raw materials. She was entirely destitute of many articles of daily, and indispensable use. Surrounded by enemies, she had not even the means of obtaining nitre for preparing gun powder for her armies. This state of things, and the great political excitement that existed at the time, resulted in prodigious and successful efforts, to supply herself from sources which had not before been thought of. The value of the physical sciences under these circumstances was perceived, nor is there perhaps a period in their history more honorable than this. No longer confining herself to the closet and laboratory, philosophy went forth, and relieved with her

treasures, the distresses of the state. In the enthusiasm of the moment, the usual motives of human action seemed suspended; especially among men of science, every thing like private interest seemed lost sight of, in a desire to promote the public good. Important discoveries in the arts, which, if practised in secret, must have yielded immense emolument, were freely promulgated for the good of the republic. In this honourable competition of the sciences, chemistry stood pre-eminent. The most eminent chemists in France, were formed into committees, by the committee of public safety; the results of their investigations will be found in the early volumes of the *Annales de Chimie*, forming the most valuable series of papers on chemistry, applied to the arts, that can perhaps be found in the history of the sciences.

Among the most important of these papers is the report of Messrs. Lelievre, Pelletier, d'Arcet, and Girard, on the best means of extracting soda from sea salt. This led to the extensive manufacture of artificial soda in France, which is at present not only principally employed in their own manufactories, but has become a considerable article of export. The process recommended by the committee, and which, with some modifications, is still practised, was invented by Messrs. Leblanc and Dize. The process is briefly this:—it consists in decomposing the muriate of soda, by sulphuric acid. The sulphate of soda, thus formed, is intimately united, in certain proportions, with charcoal and chalk pulverized. By the application of a suitable temperature, in a reverberatory furnace, a somewhat complicated series of chemical changes takes place. It has been supposed that sulphate of soda is decomposed, a part of the sulphur of the sulphuric acid, being consumed in the form of sulphuretted hydrogen, forms slight explosions, and exhibits the appearance of fire works, while the unconsumed sulphur remains in combination with a portion of soda and lime, forming hydro-sulphurets, sulphates, and sulphites. In the meanwhile, the carbonic acid of the lime, and that formed by the combustion of the charcoal, unite with the soda, and form the carbonate of soda. This part of the process requires considerable tact in its management, as the value of the article depends upon the completeness of the decomposition of the sulphate of soda, and the quantity of carbonate of soda that is formed. The process lasts about seven hours, and the residuum, thus obtained, resembles in its appearance, fine barilla.

A considerable quantity of the artificial barilla, has been imported into the United States. In consequence, however, of the badness of the article in some instances, but especially from the quantity of sulphur that even the best contain, it is entirely fallen into disrepute. So little is it esteemed in this market, that the soap makers, who are the principal consumers, as several of them have declared to me, would not accept the article as a present, though they are sensible that it contains a large proportion of alkali. They find the ley, obtained by the lixiviation of the artificial barilla, contains so much sulphur, that when boiled and mixed with the other materials for making soap, the quantity of sulphuretted hydrogen disengaged, is so great, as to render the works almost untenable, while the soap becomes of a dirty blue colour, and is rendered unsaleable.

Knowing that this substance is generally employed in the soap manufactories of Marseilles, and

that these inconveniences are not complained of there, I was induced to inquire into the cause of this, in order to ascertain whether the evil complained of, by our manufacturers, might not be remedied. My attention was naturally first directed to the difference of the two manufactories; the following are the principal points of difference. In France, soap is generally made from soda and olive oil; it is coloured, and that most sought after is called *bleu pale*. In this country, we generally use the animal oils, and in all but the very fine soaps, our manufacturers are in the habit of using a considerable proportion of rosin; the most saleable of this kind of soap is of a bright yellow colour. In France, this is marbled, by adding to it, while in a mass, a solution of green vitriol, sulphate of iron. Now it appears from the statement of M. Laurens, who is practically acquainted with the subject, that in order to impart to the soap the precise tint, so much sought after, the *bleu pale*, the presence of the sulphuretted hydrogen, or rather of the alkaline hydro-sulphuret, (for both of the alkalis are found to answer the purpose,) is indispensable. In this process, the sulphuretted hydrogen, when united with the iron and oil, imparts a greenish blue colour, which does not combine with the soap, but is dispersed through it, during ebullition, in small masses, so as to produce the marbled appearance. M. Laurens remarks, that the more scientific manufacturers at Marseilles, are in the habit of adding sulphuretted hydrogen, after treating the soap with the green vitriol, should it not be found to possess the proper colour. This seems to afford a ready and natural solution of the fact, that artificial barilla is used with advantage in the soap manufactories of France, while in this country it is so objectionable. I have had recourse to a number of experiments with different substances, for the purpose of devising a cheap method of getting rid of the sulphur, combined with artificial soda, so inconvenient to our soap makers, but without arriving at any very satisfactory results. Some advantage may be obtained if the ley be introduced into open vats, into which the clippings of tin plate, or iron have been thrown, and left standing exposed to the air for several days, and occasionally agitated.

Economy of materials is the basis of successful manufacturing, and, as the intrinsic value of the crude sodas depends entirely upon the quantity of pure alkali they contain, the manufacturer should be able to form a correct judgment in this respect. For this, however, our dealers and manufacturers have a very inadequate standard—they depend almost exclusively on the senses, and the history of the article. The appearance, taste, and weight are their chief guides; after a long experience, and having paid dearly for that experience, no doubt they can form some general idea of the value of the article; but after all, their judgment, thus formed, must be loose. They generally break a piece of the barilla, and apply the tongue to the fracture; if the soda be in a caustic state, even though in small quantity, it will excite a much stronger sensation of taste than when it exists in larger quantity, in the form of a carbonate. Nor is the history of the article more to be relied on, as there are several different qualities brought from the same market. Indeed, I have known some instances in which the most experienced soap manufacturers, and even large manufacturing chemists, have been most egregiously deceiv-

ed, by judging of the article in this loose way. I lately assayed a sample of artificial barilla, that was sold at eighty dollars per ton, the price of the best in which there was scarcely an appreciable quantity of soda, while a sample of Alicant barilla, yielded fifty eight per cent. of pure soda.

¶ In the article on Kelp, in our last, the reader is desired to make the following correction:—In the article *Fuci nodosus*, for *air bladders*, should be *air bladders*. After *Fuci loreus*, ending in these words, "this yields well in excellent kelp." Next should follow,

Fuci filum. This is the long round kind, sometimes called *caicut*. It consists of a simple frond from twenty to thirty feet long, without branches. It affords considerable quantities of kelp.

FIRE BLIGHT.

This disorder is extending itself in this vicinity, to such a degree as to threaten the destruction of all our pear trees, unless some mode shall be discovered to arrest its progress. We are satisfied that the true cause of the disease has not yet been discovered. Dr Fiske, Dr Greene, and others, of our best horticulturists, have made the most minute examination, and have been unable to discover any trace of the work of an insect. Instances have come under our own observation, where the disorder commenced in spots upon the bark, which became discolored and dead, while it was apparently sound and healthy both above and below. In one instance, these spots were found to extend down the body of the tree to the root, while most of the branches remained green and apparently healthy. Cutting off the dying branches has sometimes appeared to check the disorder, but at other times no such effect has been visible, so that it still remains a matter of doubt whether it is of any use. Still, as it cannot be injurious, and as the appearance of the tree is improved by the removal, it is safest and best to continue the practice. Quince trees are also extensively affected by the same disorder. We hope the attention of our scientific men may be turned to the subject till the cause shall be determined beyond a doubt.—*Worcester Spy*.

ARKANSAS.

This territory has been the scenes of meetings, where the hostility of individuals has been urged to the destruction of life and private quarrels have been quenched in blood. A late fight between Wharton Rector and Robert Chittenden, Secretary of the government, terminated in the death of the latter, who last fall, had killed Henry W. Conway, delegate in Congress. A rencontre occurred between Andrew Scott, late Judge of the Superior Court, who in 1824, killed Major Selden, one of his associates, and Gen. Hogan, a member of the General Assembly, when the latter was stabbed and died on the spot. The state of society where blood is shed so freely, must be deplorable. *Egis*.

CROPS.

The crops of grain in this region have generally been gathered in good order.

The quantity of hay cut and cured this season has perhaps never been exceeded in any former year.

The growth of Indian corn has also been very vigorous, and no doubt will yield an abundant crop.—*Hunterdon (N. J.) Gazette*.

FLORIDA.

In Florida alone there are more than 7,000,000 of acres suitable for the cultivation of coffee, and 8,000,000 for the growth of the sugar cane.

From Deane's New England Farmer.

HEMP.

This plant is tap-rooted, and therefore does best in a deep and free soil. It is luxuriant, and quick in its growth, and therefore requires a rich, and well prepared soil. The soils which have been found to suit it best, are a rich gravelly loam, or a rich black mould, which is dry and deep. It is an error to think that it needs a wet soil, for it bears drought almost equally with any plant that we cultivate.

Mr. Elliot found by experiment, that it answered very well on a drained swamp. He tells of a man in the Jerseys, who raised as much hemp, yearly, on half an acre of such land, as brought him fifty pounds, York money. It is not uncommon for one acre to yield half a ton, which will sell for twenty pounds in cash, at the lowest. I am told by one who is much acquainted with it, that it is more easily broken and swingled than flax; and that, oftentimes, the brake will do all that is necessary in cleaning it.

To prepare land for a crop of hemp, the land should be ploughed to a good depth in the fall of the year preceding. If it be green-sward land, it should be ploughed as early as August or September, that the sward may be perfectly rotten. And if it were ploughed in ridges it would be the better, and fit for sowing the earlier. And by cross ploughing and harrowing in the spring, it should be made extremely fine and mellow. A little dung should be applied, if the land be not in the best heart; and the fall is the best time to apply it. But if composts are used, they should be laid on just before sowing.

The time of sowing the seed is as early in the spring as the soil can be got into good order, as it is a plant that is not easily injured by frost; but the middle of May will not be too late.

The seed for sowing should be of the last year's growth, as older seed is not wont to come up at all. I once sowed seed which was brought from England. It looked as well as any I ever saw—but not one in ten thousand ever sprouted. The quantity of seed for an acre, in the broad-cast way, is three bushels; but half that quantity, in the drill method, will be enough. If the land be poor, a smaller quantity of seed will serve. The ground should be watched after sowing, that birds do not take away the seeds.

The drill method is on some accounts preferable to the other. For though in the first crop it will fall short, it exhausts the land less; and therefore, in a long run, it may be more profitable. But in this way it produces more seed, and this method is certainly advantageous on account of the more convenient pulling of the hemp. If sown on narrow ridges, or beds, and the trenches shoveled out after sowing and harrowing, I suspect the broad-cast way would have the preference.—But of this I have had no experience.

As the correspondent parts of generation are in different plants, they are of two distinct sexes, male and female, and require different treatment. I will venture to assert, (contrary to M. Mercandier) that the male is the plant which bears the flowers, and the female that which bears the fruit, or seed.

That which bears the flowers, will be fit for pulling about the end of July. Its ripeness is known by its growing yellow at the top, and white at the root, by the falling of the flowers; and the

withering of the leaves. If care be taken in pulling, not to hurt those plants which are left, they will thrive the better after it, as they will have more room, and as the earth will be stirred about their roots. And the drill method is favorable to this work, as the pullers need not tread among the thickest of the hemp. Sowing beds has the same advantage.

After pulling, it must be put into the water without delay, to steep. Ponds and still waters are best. It will not take more than four or five days to water it enough. But it must be watched, lest it should be overdone. After watering, it must be spread and dried in the sun.

The fruitful kind does not ripen till about five or six weeks later. Its ripeness is known by the seed's turning brown. After it is well dried, and the seed taken off by a kind of coarse comb—it must be watered. It will take almost three times as much watering as the first kind. The one kind is more fit to be manufactured into thread and cloth, the other more fit for rigging of ships, and ropes. But the latest kind may be made pliable and fine, if labor enough be bestowed upon it.—Instead of steeping, spreading hemp in the dew will answer, as I have found by experience; and this method is practised in England.

The dressing of hemp may be performed in the same manner as that of flax, if it be not uncommonly large and long. A person who is well acquainted with the culture and manufacture of hemp, assured me, that when his neighbor raised it on a drained swamp, he had it twelve feet long; and that he might manage it easily in dressing, he cut it in the middle. It was then as long as ordinary hemp, and as strong for every purpose.

If some of the stalks of hemp should be too large and stubborn for the brake, they may be put by themselves to be peeled by hand. The doing of it may be an amusement for children and invalids.

But to facilitate the dressing of hemp, mills should be erected for doing it. Or the machinery may be an appendage to some other mill. Two brakes should be moved together, a coarser and a finer, placed head to head, that the handfals may be easily shifted from one to the other. It is light work for two boys to tend them. But the breaking of large hemp by hand, is severe labor for the strongest men.

If no convenient stream be at hand, a mill may be constructed to be worked by a horse.

It was formerly the custom to beat hemp abundantly with mallets, or with pestles in large mortars, or in filling mills, to make it soft and fit for spinning. But Mr. Mercandier has shewn how it may be more easily done, by steeping it in warm water, or in lie, and washing it.

The great profit on a crop of hemp, and its being an article that will readily command cash, should recommend the culture of it to all our farmers. Besides the hemp itself, of the value of twenty pounds per acre, after it is dressed, the seed of an acre must be allowed to be of considerable value. Persons need not fear their crops will lie upon their hands, when they consider the vast sums of money which are yearly sent to other countries for this article, almost enough to deprive the country of a medium, and how naturally the demand for it will increase as it becomes more plenty. There is no reason to doubt of success in raising hemp, if the soil be suitable, and well prepared—for it is liable to no distemper—cattle will

not destroy it, unless it be with their feet, and it is an antidote to all sorts of devouring insects. Neither is the plant difficult as to climate. Though the hottest climates do not suit it, temperate and cool ones do—and it has been found, by the small trials that have been made, to thrive well in the various parts of New England. The most northern parts are very suitable for the growing of hemp. The southern are equally so.

A new method of rotting hemp was communicated by M. Bralle, and published in a foreign Journal, and is in substance as follows: To twenty-five gallons of water boiling hot, add twelve ounces of green soap—and when the soap is dissolved, twenty-two pounds of hemp are to be immersed, so as to be entirely covered with the liquor, the vessel closed, the fire put out, and the hemp left to macerate for two hours. Several steepings may be made in succession, care being taken to add soap, each time, to replace what has been absorbed, and to heat the water to the former temperature. The same water may be employed for fifteen days continually.

When the bundles of hemp are taken out, they are covered with straw, that they may cool gradually, without losing their humidity. Next day they are to be spread on a floor, the hands shifted, and a heavy roller passed over them—after which the hemp separates easily from the reed by beating. The hemp thus separated, is spread on the grass, and turned, and after five days removed to the ware house. In steeping the hemp, the bundles should be kept in a vertical position, as the operation is found to succeed better so than when they are horizontal.

The advantages of this method are, First, The superior speed of the process to that in common use; Second, Its being practicable at all seasons; Third, Its not being injurious to health, or producing any bad smell; Fourth, A saving of expense, when a proper apparatus is used; Fifth, A superior quality of the hemp so prepared, and less waste, so that nearly a fourth more hemp is obtained from the same raw materials; Sixth, The extending the culture of hemp to all situations, which can now be carried on only in the vicinity of running water.

A very good apparatus, for the process, is formed by a boiler, with covers for steeping vessels.

A process similar to the above described, would probably, save the trouble and expense of water-rotting flax. Lie made of wood ashes, would perhaps, answer the purpose of water impregnated with soap.

The Farmer's Assistant states that in the bog meadows in Orange county, N. Y. the hemp is cut close to the ground with an instrument made for the purpose. That when dried it is gathered in bundles, bound with straw and stacked in the field till about Christmas. It is then spread on the snow, and when the snow dissolves in March, it is generally found sufficiently rotted.

For further directions relative to the culture of hemp, see a letter from Hon. Justin Ely, published in the Mass. Agri. Repository, Vol. iii. p. 105.

A considerable advance has taken place in the price of the Liverpool and Manchester railway shares in the last week; they have been sold at a premium of £10 10s. a share, and none can now be had at that price.

The article of *white chocolate*, is among the novelties offered for sale in Paris.

THE SEASON.

Our agricultural information from Nova Scotia, is exceedingly gratifying. The weather has been, as in some districts in this Province, unusually moist;—the rivers have been high; but the vegetation has been luxuriant. The wheat crop is, at present, exceedingly promising; but the abundance of the harvest, depends altogether on the future state of the weather. If the season be dry the labours of the husbandman will be amply repaid; but if it continue wet, the promising crop will be ruined by rust, and the farmers' swelling hopes blasted.—The Wellington Dyke, in Cornwallis, contains no fewer than five or six hundred acres of wheat in one body, and presents to the eye of the traveller, when viewed in connection with the surrounding country, a scene of grandeur and variety, not surpassed by any in the Colonies.

Indian corn also promises well.—The hay has also been unusually early and abundant.—One gentleman, at Kentville, several weeks ago, planted a field with potatoes, after having reaped from it an excellent crop of hay.—At Wilnot and Aylesford, where, from the peculiarly sandy nature of the soil, all sorts of crops are generally late, the prospect is unusually cheering.

Fruit trees, however, of almost every description, have suffered severely from the early cold rains in the Spring, and, such of them as have escaped the inclemency of that season, have been attacked by the insect foe, which, by piercing the tender stone of the plum and peach, has destroyed its organization, and the subsequent development of fruit.—The extent of its ravages, we are sorry to state, has been particularly evident, in the highly cultivated and beautiful garden of the Hon. Charles Prescott, of Cornwallis, where the Apricot and Nectarine have heretofore been brought to maturity in an open exposure, but, this season, almost entirely ruined by insects.

On the whole, however, we have every reason to believe, that horticultural improvement is following, in Nova Scotia, rapidly, the late advances in Agricultural pursuits.—On viewing the present state of the Province in these respects, and contrasting it with its condition fifty years ago, the imagination of every inhabitant, whether *native* or *emigrant*, must be delighted in anticipating what may yet be expected, from an industrious cultivation of the soil. By manly resolution the early settlers have been able to surmount the difficulties and privations, necessarily connected with their first location, and which are known only to those who have encountered them. Under the operation of their axes and ploughshares, the wilderness has literally been made to "blossom as the rose."

Let the praiseworthy example of our sister Province be imitated by us,—the toil of a few years would be richly rewarded,—to our inhabitants we would say, "Go and do likewise."—*St. John (N. B.) Courier.*

CROPS IN WORCESTER AND MIDDLESEX.

During an excursion, a few days since, thro' the heart of the Commonwealth, to the neighbourhood of the Wachusett, we could not help remarking the healthy and vigorous appearance of the products of the earth. It is allowed on all hands that hay was never more abundant, but badly cured—Indian corn looks remarkably fine and luxuriant, and nothing is wanting but the hot sun of August to bring forth an uncommon crop;

small grain is not so good; rye is light, and the damp atmosphere has filled it, in many places, with ergot; barley and oats will be an average crop. The Middlesex hop growers mean this year to make up in quantity for any deficiency in quality; the arid knolls of Lancaster, Littleton and Harvard, present armies of hop poles, well covered with the vine; the brewers may expect an abundant supply. On the whole, the face of nature wears a most cheering aspect, and calls for the united praises of every intelligent being to adore the goodness of that overruling Providence, which so abundantly crowns the labors of the husbandman with success, and munificently supplies the wants of all.—*Newburyport Herald.*

GROWTH AND MANUFACTURE OF SILK.

The Editor of the Western Review is enthusiastic in his predictions of the rapid increase of this article of our home manufacture. He says,

"The impulse is excited. Enquiry is afloat.—Instead of Gros de Naples and Florence silks, and Canton and Nankin Crape, we should be glad to live to see our ladies clad in Cincinnati lustrings, in Kentucky levantines, and Mississippi, Indiana and Louisiana Persian silks. Our fair might then, with something more of palliation, contemplate themselves in the mirror, or in the transparent fountains, in the splendor of a vesture wrought and colored by their own industry. Brilliance, beauty, and industry, would enable them to bind their victims by a three-fold cord, not to be broken."

TOBACCO.

Gardeners in this vicinity use the powder or dust of tobacco to save the young and tender plants from being injured by insects. While the dew is on the ground the tobacco is thrown over the beds where the plants are just coming up; by this means their garden products are often saved from total destruction. Many plants are so completely eaten off on their first breaking through the surface, that the sower is often deceived, supposing the seed never vegetated. With farmers no crop is subject to greater injury than that of turnips. We see not why this tobacco dust will not have the same effect to save them; perhaps the price may be an objection; it now commands one dollar per bushel, but formerly could be obtained of the tobaccoists for twelve and a half cents.

N. Y. Farmer.

GREEN CROPS AS A MANURE.

The expediency and profit of any particular method to improve and enrich a soil depend on circumstances. We should suppose this season to be a very favorable one for ploughing in green crops. Old and worn out lands, that usually produce but little grass, are now richly covered. Let this be ploughed in, and it will abundantly reward the farmer another season, when it will be more wanted.—*It.*

McGlellin.—Take a hundred pounds of honey for a barrel of pure water, or in that proportion, and boil them an hour. When the liquor is cool, barrel it; adding some ginger, cloves, and mace; though it will answer tolerably well without these. Some yeast must be put in the cask to ferment it. Let it have a little vent while fermenting; but close the vent as soon as most of the fermentation is over. It will improve by being bottled, after five or six months.

PRESERVATION OF GRAPES.

In a cask or barrel having its crevices well closed, to prevent access of the external air, place a layer of bran, which has been well dried in an oven; upon this place a layer of bunches of grapes, well cleaned, and gathered in the afternoon of a dry day, before they are perfectly ripe; proceed then with alternate layers of bran and grapes till the barrel is full, taking care that the grapes do not touch each other, and to let the last layer be of bran; then close the barrel so that the air may not be able to penetrate. Grapes thus packed will keep for a twelvemonth. To restore their freshness, cut the end of each bunch, and put that of white grapes into white wine, and that of black grapes into red wine, as flowers are put into water to keep them fresh.

Observations. It is customary in France to pack grapes, for the London markets, in *saw-dust*. If the precaution of drying the saw-dust by a gentle heat, before use, be had recourse to, this expedient may answer very well; but if this is not done, and if the wood has been cut fresh, the turpentine, and other odours of the wood, cannot fail to injure the fruit. Oak saw-dust will answer best.

COCKROACHES.

A respectable professional gentleman informed us yesterday that he has recently discovered that the spirits of turpentine is an effectual remedy against the depredations of Cockroaches. He recommended to put a little of it upon the shelves or sides of your book cases, bureaux, armoire or other furniture, in which they take shelter, which may readily be done with a feather, and these troublesome insects will soon quit, not only the furniture but the room. The remedy is simple and easily obtained by every person who wishes it. It is not unpleasant to the smell—soon evaporates, and does no injury to furniture or clothing. This is a valuable discovery, if it proves in all cases, as effectual as our informant assured us it did in his house.—*Louisiana Ad.*

Method of cleaning Silks, Woollens, and Cottons, without damage to their texture and colour.

Grate raw potatoes to a fine pulp in clean water, and pass the liquid matter, through a coarse sieve, into another vessel of water; let the mixture stand still till the fine white particles of the potatoes are precipitated; then pour the mucilaginous liquor from the fecula, and preserve the liquor for use. The article to be cleaned should then be laid upon a linen cloth on a table, and having provided a clean sponge, dip it into the potato liquor and apply it to the article to be cleaned, till the dirt is perfectly separated; then wash it in clean water several times. Two middle sized potatoes will be sufficient for a pint of water.

Observations. The coarse pulp, which does not pass through the sieve, is of great use in cleaning worsted curtains, tapestry, carpets, and other coarse goods. The mucilaginous liquor will clean all sorts of silk, cotton, or woollen goods, without hurting or spoiling the colour; it may be also used in cleaning oil paintings, or furniture that is soiled. Dried painted wainscots may be cleaned by wetting a sponge in the liquor; then dipping it in a little fine clean sand, and afterwards rubbing the wainscot with it.

From the American Farmer.

PLUMS.

I have thought that some remarks, additional to those which I made in your paper of last week, on this fine fruit, might have the effect of inducing those gentlemen practically acquainted with the subject, to give the public the details of their successful practice. My information is, for the most part, theoretical, though founded, in some degree, on observation. If, therefore, not entirely useless, it is much inferior to what they can communicate.

The mode pursued by your correspondent (H.B.) of burying the fruit that is punctured and falls cannot be so efficacious as piling; for, in many instances, the infestation, so far from being fatal, would only assist the insect's natural propensity to hide itself in the ground.

The plum tree is said to flourish in almost any soil where other fruit trees will grow. I have hardly ever seen a young and uninjured tree of that sort, whether in town or in the country, that was not healthy looking and vigorous, although its fruit might never come to perfection. There is nothing in our climate or soil, therefore, to prevent its thriving; and all that remains for us, is to devise some means of protecting its fruit.

If I were making a collection of apricot, plum, and nectarine trees, whether in the country or in town, I should plant them near the house, for greater security; and if possible, in the yard, that I might have a brick pavement under and around them. I should also place them much nearer together than trees stand in such an orchard; that is, ten or twelve feet, or even in some cases, six or eight feet; and, although I should endeavor to prevent them from growing very large, I would permit them to form tall stems. In such an arrangement, there would be several advantages. You might have a greater number and variety of trees in a smaller space—there would not be required so much paving—they would be more easily superintended, and would shelter each other from the excessive heat of the sun. And the fruit would not be so exposed to being pilfered.

Another method which I have begun to carry into effect, is to cultivate these sorts of fruit on *trellises*; or, as they are usually called, *espaliers*, standing in the open field or garden, where they can be watched, and facing to the south. It is not of much importance however, how they front, for the open trellis-work admits the air and light to penetrate and pass in every direction, and the sun shines upon it from all its aspects. In this particular, the simple espalier is preferable to the *wall*, which in our climate, is generally too hot and close. These espaliers may be arranged in rows of any length, one behind the other, twenty or twenty-five feet apart; and the interval may be devoted to the raising of various vegetables. If any of your correspondents should desire it, I will hereafter give you the details of construction accompanied by a drawing. The espalier need not be confined to the fruits specified above; but will no doubt answer very well, in some places, for the peach, the pear, and even the fig. For the vine they are commonly used, and are the best way of cultivating grapes for the table.

The principal advantages of this mode are these: that it occupies less room—that you may pave along under the trees at less expense—that, as they are never suffered to grow higher than

five or six feet, or seven or eight at the utmost, every part of them can be easily reached, to pluck off the fruit, to cut away dead and broken branches, to remove and destroy any insects that may fix upon them, and that they may be covered in the late frosts and cold nights of the spring. Trees of the kind of which we are now speaking, do not require protection in the winter; and hardly any fruit that does, is worth cultivating on a large scale. There is much danger to be apprehended even to the hardiest plants, from late frosts in the spring, when they are in blossom, or their fruit is tender, or their buds are just expanding; and a person who has not witnessed it, would be surprised to see how slight a protection will effectually secure them. A mat, thrown loosely over the top of the trellis, and hanging to the ground; or even leafed branches set up against the tree, will generally suffice. If you have water at a proper elevation, it is also very easy to irrigate trees or vines planted in this way.

For the culture and training of fruit trees on trellises, ample directions are given by Forsyth and McMahon, each of whose treatises every man should possess who wishes to have good fruit.

In selecting a site for an espalier orchard, a situation would be the best, (I think) in which the trees should be exposed to the sun only until about three o'clock in the afternoon; for I am persuaded that many of the disasters that occur to our trees, are occasioned by the intensity of our summer suns. This protection might be afforded by planting the trellis within the afternoon shade of a wood or a line of buidlings; and, in some degree also, by giving it a proper front.

If these observations should be useful to any person who is anxious to be informed, I shall be much gratified.

AN AMATEUR.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 8, 1828.

ALMANACK FOR 1829.

The public are informed that the *New England Farmers' Almanack for the year of our Lord 1829*, By THOMAS GREEN FESSENDEN, Editor of the *New England Farmer*, is in press, and will speedily be published. The favourable reception and extensive circulation of this Calendar for the current year have induced the Author and Proprietor to commence the requisite preparation for an enlarged and improved impression, calculated for the year 1829. Communications of useful and interesting articles for this popular and widely circulating Diary, are respectfully solicited and will be gratefully acknowledged. They may be sent by private conveyance, or post paid, directed to the Editor of the *New England Farmer*, or Bowles & Dearborn, Washington street, Boston.

POULTRY.

The following *easy and economical* method of rearing poultry has been communicated to the London Society for the Encouragement of Arts, &c. by Mrs D'Oyley, of Sion-hill, near Northallerton, who received the Society's silver medal for the same. Where poultry are reared expressly for the market, this method is certainly deserving of attention.

Mrs D'Oyley keeps a large stock of poultry, which are regularly fed every morning upon steamed potatoes, chopped small, and at noon upon

barley. In the poultry-yard is a small building, like a pigeon-house, in which the hens lay, with a frame with nets to slide in before each hole: the building is kept dry, light, and well ventilated: and once a week the floor is strewed with fresh ashes. When she wishes to procure chickens, she sets many hens together, confining each to her respective nest, by drawing the sliding net before the hole; and they are daily let out for air, exercise, and food.

As soon as the chickens are hatched they are taken away, and the hens have a second lot of eggs allowed them to sit again, by which means they produce as numerous a brood as before.—Mrs D. puts the chickens in long wicker cages, placed against a hot wall at the back of the kitchen fire, and within them has *artificial mothers*, under which the chickens run. These mothers are made of boards, about ten inches wide and fifteen inches long, supported by two legs in the front, four inches in height, and by a board at the back two inches high. The roof and back are lined with lamb-skins, dressed with the wool upon them, and the roof is thickly perforated with holes; they have no bottom, but have a flannel curtain in front and at the ends for the chickens to run under; which they apparently do by instinct. The cage is kept dry and clean, either with sand or with moss, and is of a proper size for fifty or sixty newly hatched chickens.

When a week old, they are carried together with their artificial mother to a grass-plot, in fine weather; and the mother is kept warm by placing a long narrow tin vessel at the back, filled with hot water, which will retain its heat for three or four hours at a time; and, towards evening, they are removed back again to the hot wall. When *three weeks* old, they are put into a small room appropriated to that purpose, which is fitted up with frames similar to the artificial mother, placed round the floor, and with perches conveniently arranged for them to roost upon.

When Mrs D'Oyley first attempted to rear poultry in this way she lost several, owing to the roof of the mother not being sufficiently ventilated; and experienced many losses from improper food, until she thought of getting coarse barley-meal, and steaming it until it became soft; with which, and with minced potatoes, they are fed alternately, and are frequently excited to eat by pellets of dough that are thrown to them.

Upon this food the young chickens are stated to grow surprisingly, and soon become fit for the table or market; and Mrs D. conceives that her method might be pursued near populous towns with immense profit. A young person, it is stated, of twelve or fourteen years old, might bring up some thousands in a season; for hens may be set four times in the year, and be made to rear two broods at each setting. The proper heat of the wall is 80 degrees of Fahrenheit's thermometer; and the troughs for the food are placed without side the cages, from which to the artificial mother, a small quantity should be littered, in order to point to the trough.

Agricultural Memoranda.—In Saxony, the shepherds have no fixed wages, but are allowed a profit on the produce of the flocks. From the adoption of this arrangement, the sheep owners derive great advantage, as the shepherds have no inducement to deceive them; but on the contrary are interested in taking care of the flock. How far

This practice is feasible in our country, it would be rash to assert; it is, however, worthy of investigation and perhaps of trial.

The juice of carrots, added to cream, in winter, will give the butter made therefrom, the flavor and appearance of that made in summer. [Feeding the cows with carrots is better].

A table spoonful of unslacked lime, given to horses, regularly with their water or food, for three or four days, (night and morning) will completely expel the bots.

Water, in which potatoes have been boiled, will protect cabbages, turnips, and vines, from the ravages of flies and bugs.

It is a safe maxim, that grain should never be sown but when the ground is laid down to grass, or ploughed from it.

It is remarked by Sir John Sinclair, that neither wheat or rye straw should be given to mules, as it disagrees with them, and will render them unfit for labor.

To insure a good supply of manure for the ensuing year, profit of every favorable opportunity to draw bog and swamp earth into the barn yard.

INOCULATION OF FRUIT TREES.

The best season for inoculating or budding fruit trees extends from the middle of July to the end of August, and includes all those days when the bark can be separated from the tree without injury to the buds. The praises often bestowed on this operation as a means of changing the kinds and introducing new varieties of fruits into the orchard, are often too general to be correct.—Grafting has been found much preferable on the pear, apple, and all stocks which will bear the application of the saw and knife. The scion once set, and any man can insert a graft with success, it grows rapidly and vigorously; requires no other care than pruning the shoots which might drink too deeply of the juices perhaps once during the season,—and having passed the first year rises into a fair and healthy top, firm enough to resist the pelting of the storm and the tossing of winds. The bud demands constant care, to loosen the bandages, to thin and lop away the branches above its insertion, and after much pains bestowed is liable to numerous accidents,—a careless finger may touch it too rudely—an insect may gnaw away its head,—a blast of wind may separate its connection, and if it escape all these perils, it will be less firm than the graft. For the peach, plum and other trees from which gum exudes on being wounded, and for bushes and plants too slender to admit of the insertion of grafts, budding may be applied with advantage, and indeed is the only method which can be used to obtain the desired varieties of fruits. The Rose, well deserving the rank assigned to it in poetry, as the empress of flowers, having in its almost countless varieties a whole republic of queens, may easily be changed by this process, so that the same bush may be covered with blossoms of all possible tints and every form of beauty, and a single garden pot exhibit all the colors of the rainbow, and all the combination of leaves which wide shrubberies can exhibit. The wild briars which spring spontaneously by the way sides form hardy and vigorous stocks for the insertion of the more delicate of the cultivated species of roses, and the experiments for ornamenting their stems with chaplets of fair blossoms may furnish the reader with amusement if it lead to no more useful result.—*Nat. Exg.*

Plums, Peaches, &c. how kept fresh through the year.—Beat well up together equal quantities of honey and spring water; pour the mixture into an earthen vessel; put in the fruits all freshly gathered, and cover them quite close. When any of the fruit is taken out, wash it in cold water, and it is fit for immediate use.

The fumes of brimstone are useful in removing spots or stains in linen, &c.: thus, if a red rose be held in the fumes of a brimstone match, the colour will soon begin to change, and, at length, the flower will become white. By the same process, fruit stains or iron moulds may be removed from linen or cotton cloths, if the spots be previously moistened with water.

Negotiations have been once more commenced between His Majesty's Ministers and the Government of the United States, for reopening the commerce between the British West India Islands and the ports of the Union. *Montreal Courier.*

The editor of the Milledgeville Recorder states, "that the district of country round Milledgeville, including a territory of forty miles square, is indebted to the banks to the amount of two millions of dollars."

Farmer Wanted.

An intelligent, capable man is wanted to take charge of a Farm a few miles from the city. He must be able to produce undoubted references, as to his knowledge of the business, habits of industry, &c. With one having the requisite qualifications an arrangement might be made for taking the farm on shares. FOR SALE.

An excellent Mare with her Colt, by the celebrated Horse Breeder. Also, a Bull, two years old, by Denton—perfectly kind and good tempered. Likewise, one full blood Merino Ram, one Ewe, and one Lamb. Apply at the office of the N. E. Farmer. *St. aug. 8*

DISTRICT OF MASSACHUSETTS, to all District Clerk's Office.

Be it remembered, That on the eighteenth day of July, A. D. 1827, in the fifty-third year of the Independence of the United States of America, J. B. Russell, of the said district, has deposited in this office the title of a book, the right whereof he claims as proprietor, in the words following, to wit:

"The New American Gardener; containing practical Directions on the Culture of Fruits and Vegetables; including Landscape and Ornamental Gardening, Grape Vines, Silk, Strawberry, &c. &c. By Thomas G. Fessenden, Editor of the New England Farmer."

"God Almighty first planted a Garden; and indeed it is the purest of human pleasures; it is the great refreshment to the spirits of man; without which buildings and palaces are but gross heap of works.—Bacon's Essays."

In conformity to the act of Congress of the United States, entitled, "An Act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies during the times therein mentioned;" and also to an act, entitled, "An Act supplementary to an act, entitled, An Act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies during the times therein mentioned; and extending the benefits thereof to the arts of designing, engraving, and etching historical and other prints. JNO. W. DAVIS,

Clerk of the District of Massachusetts.

Seeds for Fall Sowing.

For sale at the New England Farmer Seed Store, a fresh supply of various Grass Seeds—also a great variety of vegetable seeds for fall sowing, viz. White Portugal Onion, Strasburg do, Silver skin do, Prickly Spinach and Dutch Cole for early greens—various kinds of lettuce, carrot, cucumber, cabbages, &c.—black Spanish or winter radish, &c. all warranted fresh.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 1,0 to 300 acres of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D." Boston, through the post-office. *St. Aug. 1*

Wanted.

A young man is wanted, to attend to the sales of a Milk Establishment, who can produce the most undoubted recommendations—none other need apply. Liberal wages will be given. Apply at the New England Farmer Seed Store, No. 52 North Market-street.

Barefoot and Serab.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Coffin, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Barefoot, a chestnut horse, is as follows:

FOALED 1820.

Barefoot, by Trump, dam Rosamond by Buzzard, out of Roseberry, sister to Hiley and Tartar, by Phenomenon, out of Miss West by Matcham—Regulus—Crab—Chubbers—Rastal.

In 1822, when at Pontefract, sweepstakes of 20 gs. each, for two years old—11 subs. Barefoot beating Harpocrat.

In 1823, York Springs St. Ledger, of 25 gs. each, 6 subs.—Barefoot beating four others.—A. Pontefract sweepstakes of 10 guineas each ten feet, 10 subscribers. Barefoot beating Palatine.

In 1823, the Doncaster great St. Ledgers, of 25 gs. each, 30 subscribers. Barefoot beating 11 others.

In 1824, at New Market, Barefoot won a handicap plate value £30, beating Tressdun and five others.

In 1824, at A. Cot Heath, Barefoot walked over for the Swin-las stakes, of 25 sovereigns each 3 subs.

In 1825, at Lancaster, the gold cup, value 10 gs. added to a sweepstakes of 10 sovereigns, 17 subs. of all ages. Barefoot beating Lottery and two others.

In 1826, at Manchester, Handicap stakes of 20 sovereigns each, 10 ft. with 20 sovereigns added—6 subscribers—Barefoot beating two others. At Lancaster, the gold cup, value 10 gs. added to a sweepstakes of 10 sovereigns each, 9 subs.—Barefoot beating two others.

SERAB, (a beautiful bay Horse.) FOALED IN 1821.

Got by Phantom out of Jesse, by Tutteridge—her dam Cracker by H. ghlyder, out of Nutteracker, by Matsum.

In 1824, won the New Market stakes, 50 gs. each, 21 subs.—Serab beating four others.

In 1825, at the New Market Crane meeting, the stakes, 100 sovereigns, 7 subs. Serab beating two others. The same year, Spring meeting, Serab won Handicap sweepstakes, 100 sovereigns, 6 subs. beating three others.

In 1826 Serab won Kings Plate, 100 gs. beating 20 others. In 1827, Serab won the 100 gs. *St. Aug. 13*

MISCELLANIES.

THE SWEET BRIER.—By BRAINERD.

Our sweet autumnal western-scented wind
 Robs of its odors none so sweet a flower,
 In all the blooming waste it left behind
 As that the sweet brier yields it; and the shower
 Wets not a rose that buds in beauty's bower
 One half so lovely—yet it grows along
 The poor girl's path-way—by the poor man's door
 Such are the simple folks it dwells among;
 And humble as the bud, so humble be the song.

I love it, for it takes its untouch'd stand
 Not in the vase that sculptors decorate—
 Its sweetness all is of my native land,
 And 'tween its fragrant leaf has not its mate
 Among the perfumes which the rich and great
 Buy from the odors of the spicy East.
 You love your flowers and plants—and will you hate
 The little four leaf'd rose that I love best,
 That freshest will awake, and sweetest go to rest!

LINES

From the Saco Palladium.

Give me a snug little farm, with sufficient leav'n to understand
 my bible—a little wife that can milk the cow, and rock the cradle—
 that can sleep at night, and work all day—that can discourse
 coarse music on the cheerful spinning wheel, and hang your
 Gosh and Lotin. The present times are too unnatural and
 luxurious.

Our ancestors liv'd on bread and broth,
 And wou'd their healthy wives in home-spun cloth;
 Our mothers nurtur'd to the nodding reel,
 Gave all their daughters lessons on the wheel.
 Though spinning did not much reduce the waist,
 It made the food much sweeter to the taste;
 They plied with honest zeal the mop and broom,
 And drove the shuttle thro' the noisy loom.
 They never once complain'd as we do now,
 We have no gul to cook, or milk the cow.
 Each mother taught her red cheek'd son and daughter
 To bake, and brew, and draw a pail of water.
 No damsel shou'd the wash-tub, broom, or pail,
 To keep unsullied a long grown finger nail.
 They sought no gaudy dress, no wasp-like form,
 But are to live, and work'd to keep them warm.
 No idle youth, no tight-lac'd mincing fair,
 Became a living corpse for want of air.
 No fidgets, faintings, fits, or frightful blues—
 No painful corns from wearing Chinese shoes.

March of intellect.—A gentleman on visiting the school of Mr. Wood, in Edinburgh, had a book put into his hand for the purpose of examining a class. The word "inheritance" occurring in the verse, the querist interrogated the youngster as follows:

Ques.—What is inheritance?

Ans.—Patrimony.

Ques.—What is patrimony?

Ans.—Something left by a father.

Ques.—What would you call it if left by a mother?

Ans.—Matrimony.

The Dutchman's shower.—Our steady rain has been interrupted by two or three days of good weather, and pleasantly cool. We have found a good description of the previous month, in the Dutchman's weather journal, "had a dunder shower for tree weeks, and then it set in for a settled rain."

Messrs. F. & J. Andrews of Lancaster, propose to publish an Edition of Mrs. Rowlandson's Narrative of her captivity and sufferings among the Indians, by whom that town was destroyed in 1676.

RATTLESNAKES.

The present season has discovered an unusual number of these venomous reptiles: several persons have been bitten, and some lives lost. The opinion of naturalists and others as to the manner in which this snake inflicts the wound, or rather when inflicted, ejects the poison into it, does not appear to be settled. Some suppose that the poison is thrown into the wound from a bag seated at the root of its tongue, and located there by nature for its reception. Others believe that the poison is contained in the upper jaw, and when the bite is inflicted it is injected through a small orifice in the tooth into the wound.

The latter hypothesis we believe is most correct. The upper jaw of the rattlesnake is provided on each side with one, two and three fangs, similar in size and appearance to the claw of a cat's foot. They are situated in the jaw, with their points inward. When the snake prepares to bite, he coils himself up with his head drawn back, he maintains his ground with resolute firmness, but with his rattle, warns you of his presence.—The lower jaw performs no part in the operation of biting—it is done entirely by the spring of the animal.

A few days since a gentleman of this town caught a rattlesnake, and with a forked stick fastened him to the ground, while with a knife he extracted the fangs, after which the snake bit a person with his masticators, without injury resulting from it. We examined two of the fangs of this snake, and the cylinder in them was distinctly visible to the naked eye, and in order to be more certain we inserted a horse hair with ease through it, their cavity passing through the tooth from its root, and coming out close by the point. It has been repeatedly said, and correctly too, that there is no part, however minute, of the animal creation, which nature has not adapted to some useful purpose. What then are those cavities in the fangs used for, which are so entirely different from the ordinary operations of nature? They are clearly intended for the transmission of the poison to the wound inflicted.—*Miner's Journal.*

Gigantic hemp.—There is now growing on the property of Stephen Girard, in Passyunk township, Philadelphia county, a stalk of hemp, (amongst others) nine feet four inches high, and has not yet attained its ultimate height. The stalk is four inches and a half in circumference, just above the surface of the ground.

Cure for the fever and ague.—Take a gill of very strong coffee, mixed with an equal quantity of lime juice—the dose to be taken just before the fit of ague is expected. Dr. Ponqueville's "Travels in the Morea," contains the following: I have often seen intermitting fevers subdued entirely by a mixture of coffee and lemon juice, which is the general remedy for them, all over the country. The proportions are three quarters of an ounce of coffee, ground very fine—two ounces of lemon juice, and three of water. The mixture to be drank warm, and fasting.—*Charleston Mer.*

Lowell.—Above 125,000 yards of cotton cloth, and about 3000 yards of cassimere, are manufactured weekly, in Lowell.

It is stated, that Mrs Hemans, so long distinguished as the first poetess of the age, is about to make Edinburgh her place of residence.

SEXUALITY OF PLANTS.

This remarkable structure of plants exemplifies the same indispensable process in the vegetable as in the animal kingdom. One of the most singular plants which exhibits this structure in a very striking manner, is the *Valisneria spiralis*, a species which is common to Europe as well as to this country. It is an aquatic, growing on the margin of rivers, and bearing its fertile or female flowers on a very long spiral foot-stalk, so that whatever depth the tide may cause in the waters, it always floats; the male flower, on the contrary, is attached to the stem, and is submersed until it is ready to blow, when it detaches itself from the stem under water, rises to the top, and carries its pollen to the female plant.

The same remarkable mode of fructification exists in a plant peculiar to this country. This is also an aquatic, very small, and much resembling a species of moss. The whole plant is immersed in fresh water streams. The female flower is attached to a spiral stem so slender as scarcely to exceed the finest hair in diameter; the male is borne on the stem under water, and migrates at its maturity to the surface, sheds its pollen, which floats around the female plant until the office of fructification is performed, when it withers and dies. It is the *Udora canadensis* of Nuttall, and may be found in the months of July and August in most of the tributary streams of our rivers.—*N. Y. Farmer.*

RASPBERRY WINE.

Take equal quantities of fruit and water, bruise and let them stand two days, then strain it, and to every gallon put four pounds of coarse sugar, when dissolved, put the liquor in a barrel, and when fine, which will be generally in three months, bottle it, and in each bottle put a large spoonful of brandy.—*ib.*

COFFEE.

It was owing in some measure to a distinguished French botanist, that we are so abundantly furnished with the coffee berry. Two plants were, under his care, taken to the West Indies, from the botanic gardens at Paris, but on the voyage the supply of water became nearly exhausted; this person was so anxious to preserve the plants that he deprived himself of his allowance in order to water the coffee-plants. From these two, all the coffee grown in the West Indies has sprung.—Formerly, coffee could only be got at a great expense from Mocha in Arabia.

Turnip Seed, &c.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, Boston, an extensive assortment of Turnip Seeds, some of which are the growth of the present season—the finest sorts either for family use or stock. The most improved sorts for the former are the White Stone, White Dutch, Yellow Stone, Yellow Malta. The *Yellow Stone* is one of uncommon excellence and keeps well. Of the sorts for field culture, the White Norfolk, White Globe, and *Yellow Aberdeen* or *Bullock* are preferable. The *Yellow Aberdeen* is most approved among the farmers of England and Scotland, as it grows to a large size, is very sweet and nutritious, and keeps till June. Also, *Yellow Ruta Baga*, or Russian Turnip, of the best description. The above seeds were saved in Europe expressly for us, and the utmost dependence may be placed upon their genuine quality. A variety of Long and Turnip Radishes, suitable for growing the three ensuing months. Prickly or Fall Spinach, Long Prickly and Early Cluster Cucumber; also the genuine Girkin Cucumber, or West India pickling one of the finest pickles.

Likewise 200 lbs. fresh common white flat English Turnip Seed, a part of it the growth of 1825—to dealers and purchasers by the quantity, it will be put at a low rate.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VII.

BO·TON, FRIDAY, AUGUST 15, 1828.

No. 4.

AGRICULTURE.

TARRING FRUIT TREES.

MR. FESSENDEN,—Our town has for several years been infested with the Canker Worm; the orchards, in some sections, having been completely ruined by them. Every expedient has been resorted to for the preservation of the trees, but none have been successful except tarring; and this, when properly applied and attended to, has proved entirely efficacious.—I have about 250 apple-trees, from twenty to thirty years old, and the last season I made use of between one and two barrels of tar, and a man would, after becoming a little more used to the business, apply a sufficient quantity to every tree in less than two hours, including the time taken in heating the tar, which should be rather more than blood warm. This, to be sure, is attended with some expense, but after all it is trifling, when compared with the loss of your fruit; or even the desolate appearance of your orchards, and the annoyance of the creeping millions, when the trees will no longer afford them sustenance, covering your fences and buildings, and like the flies of Egypt, "corrupting the whole land."

The method adopted by me is as follows:—I took the common sheathing paper and cut it into strips about four or six inches in width; these strips I dipped into tar which had boiled long enough to be pretty stiff when cold, and as soon as they could be conveniently handled, placed them round the trees, by tacking them with pump nails where necessary, and at a proper distance from the ground for the easy application of the future dressings. After having prepared the trees as above, you may rest perfectly easy until there is a frost sufficient to chill the surface of the ground. I know not what particular agency the frost has in the business, but such I believe is the fact, that none of the insects move from their fragile habitations, until they are awakened to a sense of their situation by a slight touch of the icy finger of Winter. But after a frost, as above mentioned, a single night must not be suffered to pass, until your trees have been secured by a dressing of tar on the paper, and where the paper does not adhere to the unevenness of the tree, grass may be put in to fill up the space, and a little tar upon it will stop any from going through it. The tarring must be continued every afternoon, (the later the better, as the insects do not move much till about sunset,) until sometime in the following May, unless the ground should be entirely closed with frost, or covered with snow.

Particular care should be taken in this respect; for the insects will continue to go up all winter, whenever the top of the ground is sufficiently thawed to admit of it. Nothing need be feared from the miller, or other winged insect, this being the male—the females having no wings to assist them in their ascent, the tar will be sure to arrest them, if properly and daily applied.

The trees do not suffer by the above process, the tar being confined to the paper, which may be taken off the 1st of June, leaving the bark perfectly bright and free from stain.

In this way orchards have been preserved from

the Canker Worm in the midst of their ravages, affording here and there a green spot for the eye to rest upon, when all around wore the appearance of worse than wintry desolation; in other instances, orchards have been reclaimed, after having been for several years stripped of their foliage and laid entirely waste; but in the latter case, much more time and care is required than if taken on their first appearance.

W.
Lynn, Aug. 5, 1828.

EMPLOYMENT OF TIME.

MR. FESSENDEN,—Your repeated favors induce repeated demands upon your goodness. I should like to add to your hints, inserted in your last upon the improvement of the winter evenings of farmers. If farmers benefit themselves by weekly, social meetings, they may confer a still greater benefit upon their sons and their daughters. If a subject upon agriculture or domestic economy, say the raising, use, and preservation of fruit—the management of a garden, or some particular vegetable, of a dairy, of poultry, or of fuel, should be prepared at one meeting for consideration at the next, it would naturally, and almost necessarily, become the topic of conversation at the table and fireside; both before and after the regular discussion. Conversation upon a particular and important subject would create a desire for reading, and this desire would lead to the possession of books, and periodical and weekly journals, which treated upon it. The natural consequence would be, that conversation and social intercourse, the channels of almost all the information and habits, both good and bad, which exist in the world would be purified and elevated. Topics of conversation would be immediately changed. Substantial improvements upon farms, domestic economy and convenience, the principles of science which ought to direct, in the construction and uses of farming utensils, the laws of heat, upon which the economy and success of the management of fuel depend; and consequently natural philosophy, chemistry, general science upon matter, intellects and morals, would, in conversation, take the place of a fashionable dress, or novels, the shape of a leghorn, the color, form or position of a bow most fashionable upon headresses, and what is still lower, of petty scandal. And consequently good would be done and evil prevented.

FRANKLIN.

NURSERIES AND GARDENS ON LONG ISLAND.

If Mr. Fessenden thinks the following memorandum, made on a late tour to the city of New York, worth the space they will occupy in a corner of the New England Farmer, he will oblige a subscriber by inserting them. I conceive it a just tribute to the Long Island nurserymen; though we shall soon show them something of the kind worth seeing in the vicinity of Boston.

Yours, &c.

Newton, Aug. 12, 1828.

VIATOR.

At Flushing we visited the Linnaean Botanic Garden, the establishment of WILLIAM PRINCE, Esq. This is probably the most extensive collection of exotic and indigenous productions in the

state of N. Y. and covers an extent, (buildings, &c. included,) of about 30 acres. Much taste and regularity is discoverable in the arrangement, and the intelligent proprietor has spared neither pains or expense in collecting from every quarter of the globe every tree, fruit, and plant, which might subsist for the use of man, or for ornament. At the time I was there, his collection of roses were in bloom; these cover the extent of an acre, and consist of more than 600 different kinds.

Opposite to Mr. Prince's is the establishment of Mr. MILLS. This consists of 8 acres, closely filled, and contains an extensive collection of fruit trees and ornamental productions.

In the immediate vicinity of these nurseries is the establishment of Messrs. BLOOMGOOD & Co. of deservedly high reputation. Here, too, may be seen a very extensive collection of fine fruit and ornamental trees, shrubs, &c.

At Brooklyn we called at the celebrated Horticultural Garden of Mr. ANDRE PARMENTIER. This is a recent establishment begun in 1825. It contains 20 acres, and is surrounded by a wall of masonry, after the manner which we are told is practised on the old continent; a portion of this is, as yet, brought into a state of cultivation; it already contains, however, a valuable collection of fruit and ornamental trees, green-house plants, &c. and especially of grape vines which he has increased by extensive importations. This garden, so far as completed, has been laid out by the very intelligent proprietor in the most modern style and with great taste; for in the branch of ornamental and picturesque gardening, Mr. Parmentier, it is believed, greatly excels. On an eminence, in a corner of the garden, he has constructed a small, cheap edifice denominated a "Rustic," from the top of which you have a commanding view of the surrounding country.

VINES.

Extract of a letter to the Editor of the New England Farmer, dated Bridgeport, Conn. August 5, 1828.

I had it in contemplation to give you a statement of some vines, of different varieties, which were planted in the fall of 1826, but have thought better to omit a more full account until I have given them a fair trial. To give you some idea, however, of their vigorous growth, I will mention the length to which some of the shoots of the present season have attained; I measured them on Saturday, 3d of August, and found the longest branch of the early white grape to be 15 feet, shortest 10 feet—6 branches in all, average 12 feet each, making the whole length of all to be 72 feet.

White Chasselas,	4	branches,	average length of each	10	feet.
Musk do.	5	do.	do.	do.	13
Black Hamburg,	5	do.	do.	do.	12
Tokay,	3	do.	do.	do.	13
Munier,	5	do.	do.	do.	10
Chasselas of Fontainebleau,	6	do.	do.	do.	9
Golden Chasselas,	4	do.	do.	do.	9
Black Sweetwater,	1	do.	do.	do.	8
Isabella,	15	branches,	two largest 17 feet each, shortest 9 feet,		
			average length of each 13 feet,—making whole length of all		195 feet.

The abovementioned vines are all in fruit, containing from two to fourteen bunches each, and the Isabella, fifty bunches. It will be observed

that this is the second season of growth since I received them; the fruit all looks well, and I think promises good success.

I have seen it recommended to graft some fine varieties of the grape on our native stock of vigorous growth, but have never seen an account of its ever having been tried.

I inserted a couple of grafts of the Isabella grape the last spring, which succeeded very well; the longest having already attained the length of 9 feet, and the shortest, 5; they now grow to the length of a foot, or little more, a week. J. B.

Our correspondent will accept our thanks for his statement; as the culture of grapes as a fruit for the table is now exciting much attention in New England, articles on this subject are perused with much pleasure. The Messrs Winships, of Brighton, had on the first year's growth of wood, of an Isabella vine, one hundred and twenty bunches. This year on the first and second years' growth there are three hundred and sixty-four bunches; two horizontal and one upright branch, each extending twelve feet from the trunk.

FOR THE NEW ENGLAND FARMER.

THE MASSACHUSETTS PROFESSORSHIP OF NATURAL HISTORY, AND THE BOTANICAL GARDEN AT CAMBRIDGE.

The Visitors of this Professorship, and public garden, feel it to be their duty to lay before the public, its actual situation, and its imperious wants. While its critical circumstances impose this obligation on the persons intrusted with its care, and management, they are sensible, that it is their duty to lay before the public, the history of their administration of its funds, in order that those who have contributed to it, and those who may be solicited to afford their aid to prevent its decline, and possibly ruin, may be enabled to judge how far the trust committed to the Board of Visitors has been faithfully executed. The subscription was commenced in 1801, and completed in the spring of 1804. There was a general and we may say an universal feeling in this state, that the natural history of the United States had been much to our disgrace, entirely neglected. There were, at the time when this subscription was opened, but two persons in New England, who could give a scientific description of any tree, shrub or plant, in this portion of our country. The other branches of natural history, Zoology, Entomology and Mineralogy, were in a state still more miserable. Yet at that moment, the remotest parts of Germany and Sweden were familiar with our plants, and when our early botanists began their studies, they were obliged to resort to the works of those distant authors written in a foreign or a dead language, in order to know with any accuracy the plants which sprung up under their feet. It was not, however, a sense of national inferiority alone which stimulated the exertions of the founders of the Botanic Garden at Cambridge. A personal experience of the embarrassments, which attended both useful and ornamental horticulture in the very limited state of knowledge which then existed, had its share in producing the exertion. Our fruits and ornamental plants were known by such an endless variety of names, that no man could feel the least security, when he ordered a tree or a plant, that he should not receive one, which he had before possessed in great abundance.

These motives led to the attempt to found a botanical garden. That it was so successful in the then existing circumstances of the town of Boston, and of the state is as surprising as it is honorable to the contributors. Boston did not at that time contain a population exceeding 35,000 souls. Yet a subscription was readily made of 35,000 dollars. The subscribers, instead of seeking an act of incorporation, or of granting the funds raised, directly to the College, chose to vest the visitorial power, and the entire management of the funds in the Trustees of the Massachusetts Society for Promoting Agriculture, with whom they associated the President of the American Academy of Arts and Sciences, and the President of the Massachusetts Medical Society for the time being. The motives, which led to this arrangement will be readily perceived. The duties of the Corporation of Harvard College were very great, and principally devoted to the care and discipline of the University. They might be, and in all probability would be, men, not conversant with Horticulture. The great object of the establishment, being the promotion of knowledge in native and foreign plants, useful in agriculture, horticulture and medicine, as well as the encouragement of the sciences of botany and entomology, it was natural and highly expedient, that the care of the Institution should be committed to persons among whose duties were the promotion of agriculture, horticulture, and the knowledge of the materia medica.

The funds raised by subscription were about 35,000 dollars. To this sum was added a grant of a township of eastern lands, which from various unfavorable circumstances has not been available to the Institution in any degree. The Board of Visitors will now proceed to state the manner in which they have disposed of these funds. There was no competent knowledge, existing in this country, as to what were the wants of a Botanic Garden, or as to the mode of putting one in operation. The Board of Visitors themselves decided that it was expedient to send the first Professor to Europe to acquire this knowledge. This voyage cost the Institution 9,000 dollars, and the Library selected by the Professor 1100 dollars more.—This, it will be at once perceived, made a serious encroachment on their funds.

The land on which the garden is placed, including the gardener's house, cost 1800 dollars, and a better location could not have been made within a reasonable distance from the College. The fences cost 1000 dollars. The Green Houses, equal if not superior to any in the state, cost 25,000 dollars, and the Professor's house 4,000 dollars.—The whole of the foregoing sums, to wit.

For the voyage of the Professor	-	\$9,000
“ Books	- - - -	1,100
“ Land	- - - -	1,800
“ Fences	- - - -	1,000
“ Green Houses	- - - -	2,500
“ Professor's House	- - - -	4,000

\$19,400

The laying out and planting the grounds including drains, banks, fish pond and walks, were cheaply executed for

6,000

\$25,400

There was some accumulation of income during the erection of the buildings and laying out the grounds, so that when the accounts were closed,

there remained property on interest to the amount of 13,000 dollars, besides a note of seven thousand dollars taken for a township of land granted by the Legislature, which owing to the misfortunes of the promiser became of no value, and the Board of visitors were glad to receive back the contract for the land, and to cancel the notes.

The fund thus diminished produced only 800 dollars per annum, while the Board of visitors were obliged by law, and by every sentiment of honor and justice to pay to Professor Peck his moderate salary of 1200 dollars. No man, it is presumed, will complain, that the Board of visitors declined to withhold its support from the first naturalist of New England, because in their service by the act of God he became unable to perform his duties. This obligation reduced the funds still lower. The Garden would long since have followed the fate of the Charleston Public Garden, and the New York Garden, founded by Dr Hosack, and purchased by the state, at the price of 35,000 dollars. It would have, like them, been converted into a wilderness, had not the Visitors applied for, and obtained the aid of the Legislature—of a very enlightened Legislature, who, not mistaking false maxims of economy for true ones, saw in the destruction of a great public work, great public loss, deeming that the riches and prosperity of a state are as much promoted, to say nothing of its reputation, by wise and generous establishments for the promotion of knowledge, as by any financial measures. The amount received from the Legislature could not in any one year exceed by the resolve itself 600 dollars, and frequently fell short of 500. Even this small sum has not been received during the last three years owing to the state of the Treasury. The Botanic Garden founded by private munificence, and one of the most honorable Institutions of the State must fall, unless a small portion of the public spirit exhibited by our predecessors still remains to be called forth in its support. Of this the Visitors can entertain no doubts; doubts, which would be a reproach to our present state of society—to a much more extended, and a much wealthier population. It is now more than 25 years since the last appeal was made on this account to public munificence. Many persons have accumulated fortunes since that time, and others, who then subscribed have increased their means of doing good.

It only remains now to state the wants of the Institution, and the means proposed of relieving them. The fences require an entire renewal.—They have lasted 20 years, which is all that can be expected from wooden materials. They can be replaced for 1000 dollars. The Garden stands in great need of a stove or hot house for tropical plants. The present house is a green house only, and when it is made sufficiently warm for tropical plants, the plants of cooler countries suffer. This, too, prevents our raising so many plants for sale, as we could wish to do, for the true policy of the establishment is to make it eventually support itself. At present it produces about 400 dollars a year, and on the proposed plan it is confidently hoped it will yield a thousand.

The next and a very pressing want is an adequate support, and at least something approaching to a suitable reward to the Curator. No Botanic Garden in the whole world can be found without one man of science at its head. In the impoverished state of our finances, we could offer to Mr NUTTALL only 500 dollars a year. But he had en-

couragement to hope for a better state of things; to him, that promised time, though patiently expected for seven years, has not yet arrived. Mr NUTTALL has been for many years under the eye of the Board of Visitors. To the nation he was before well known. His conduct and his acquirements have appeared to the Board of Visitors, all that they could wish or expect from a man, who has devoted his best days to illustrate the natural history of these States. He has traversed all the most unhealthy climates of the United States, and from them all collected additions to our catalogue of plants. As a writer on subjects of natural history, Mr NUTTALL takes a high rank. All his works exhibit a clearness, and a thoroughness of knowledge accompanied with simplicity, which render them highly valuable in the infant state of this science in our country. His last work, intended as an Introduction to Botany, for the use of students, is one of the best in our language.—Can there be a wish to restrict the compensation of this deserving and unassuming man to a miserable pittance of 500 dollars a year? We cannot expect that our Institution will flourish under so parsimonious a system. Some additional labours will be required in the Garden to make it what we wish it should be, an honor to Massachusetts; one of its sources of praise from foreigners, and of pride to ourselves.

For these various objects we ask only a subscription amounting to half what our fathers did for it, and for us. From 17 to 20,000 dollars will place the Garden in a state, which will require no further public aid. The Board of Visitors may take some share of praise for having made the Garden what it is, without calling for further subscriptions. The Garden at Cambridge would be deemed a respectable one in Europe. It is not much inferior to that at Edinburgh, or Leyden, and it is superior to an ancient one at Rouen, and many in Italy. In this address to the public we shall not be able to enter into details, but we shall publish in a separate sheet, the past and present state of our collections.

Our proposed mode of placing this garden on a footing with the one at Liverpool, (which is the mark at which we would aim) is,

First, by soliciting subscriptions in aid of the permanent fund. These subscriptions are not expected to be great from each individual, though we hope that the opulent, though often pressed into the public service, may set an example of liberality.

In soliciting these subscriptions we shall appoint those as solicitors (who we believe feel the importance of this school for a neglected science) to aid our own efforts.

Our second proposition is suggested by the experience of the Garden at Liverpool. That fine establishment is supported chiefly by the public taste. The love and admiration of the beauties of nature is taxed, and not taxed in vain. Annual subscriptions are made for the privilege of visiting the Garden, and we should hope that this resource will not be found unavailing here.

It is proposed to have two prices for annual subscriptions,—one of three dollars a year, for which the subscriber shall have a ticket to admit his own family gratis for the year in winter and summer; the second to be five dollars, for which the person subscribing shall receive a ticket of admission on the same terms as those above stated, and shall moreover be entitled to receive plants, or cut flowers for ornament to the amount of two dollars.

Subscribers to the amount of 50 dollars shall also have tickets of admission for life for their families only.

Subscribers to the amount of 100 dollars shall have tickets of admission, gratis, during life, and shall be entitled to receive plants to the amount of 3 dollars a year.

Subscribers to the amount of 200 dollars and upwards, shall have tickets of admission, gratis, during life, and shall have a right to receive plants to the value of 9 dollars per annum.

The prices of plants shall be fixed by the Curator, and shall be placed as low to subscribers as they are sold for cash.

It is, however, distinctly to be understood, that there are many plants which from their rareness or high value cannot be sold, but the classes of plants which are ever sold, the subscribers shall have an equal right with other purchasers to receive.

It may be proper to observe, that there are many hardy plants fit for private gardens which are always for sale, and persons wishing to procure such plants are earnestly requested to give to the Public Garden the preference.

A taste for botany, and for flowers, as necessary as agreeable ornaments, is inseparable from a state of polished society. It would not be credited, if we were to state the amount paid for flowers in London, Paris, Liverpool, Amsterdam, and all the other great cities of Europe. Our country cannot form an exception. New York and Philadelphia now support great establishments for the cultivation of flowers. It is not to be believed that a similar taste will not prevail among our ladies. We have one advantage over our sister states. We have a public garden, honorable to the state, and to the city, whose inhabitants founded it, and while we gratify our own tastes, and give pleasure to those who visit us, by ornamenting our rooms with the choicest productions of nature, we may feel at the same time, that we are contributing to the advancement of an establishment which will confer honor on this portion of our country.

REPORT.

The Committee to whom was referred the subject of devising means of relieving the present necessities and of promoting the future extension of the Botanical Garden at Cambridge, and the Professorship of Natural History, there established, submit the foregoing address to the public, and plan to the consideration of the Board of Visitors.

JOHN LOWELL, *Chairman.*

At a meeting of the Board of Visitors of the Massachusetts Professorship of Natural History, held at the house of the Hon. RICHARD SULLIVAN, on the 10th day of August, 1828, the above report was accepted, and the subject was committed to JOHN LOWELL, Esq. Dr JAMES JACKSON, and JOHN C. GRAY, Esq. to adopt such measures as they may deem proper to carry the foregoing plan into execution.

Attest.

B. GUILD, *Secretary.*

TREES.

Extract from an Address to an Agricultural Society in Maryland by THOMAS LOW, Esq. President of said Society.

Permit me again to urge you to plant locusts, chestnuts, cherries, and other useful trees, along your fences. Mr. Say, a much approved author on political economy, says, "In all times, attention to trees is recommended most strongly by

the ablest men.—The historian of Cyrus, puts amongst the number of his titles to glory, his having planted all Asia Minor with trees.—Sully, who had so many valuable economic views, planted trees in almost every province of France. I have seen many of them, to which public veneration attached his name, and they reminded me of Addison's observation, whenever he saw a plantation of trees, when he exclaimed "a useful man has been here."

"Man has only to plant trees once, and nature does all the rest—they become an ornament and enrich the proprietor, and they also add to the salubrity of the air—for the leaves absorb carbonic acid gas, which, when too abundant, is destructive of health, whilst they give out oxygen, which is that part of air the most proper for respiration."

Mr. Say also observes, that trees cause rain, and also benefit the soil by sheltering it from drying winds. Mr. Say undoubtedly alludes only to the absorption of bad air, but trees may be planted to improve it. The Asiatics have learnt from experience, that trees are either prejudicial or beneficial to health, according to their different exhalations, and to confirm, tell a story of two physicians, who resided at a distance, and wished to ascertain each other's skill. The first chose a stout man, and told him to carry a letter to the other, and to sleep on the road every night, under a tamarind-tree—the purport of the letter was, that the bearer had a complaint, which baffled his skill—the man arrived sick, the physician, by his inquiries, learnt the cause of his disorder, and immediately ordered him to sleep every night under a banyan-tree, and to deliver this reply, "the bearer you will find recovered."—Wholesome trees, in large cities, would perhaps prevent the yellow fever.

SELF-SHARPENING PLOUGH.

An enterprising mechanic has been here during the past week, exhibiting an improved cast Iron Plough, for which a patent has been obtained.—The advantage of this kind of plough is, that the share or point, being separate pieces from the mould iron, which have their upper and under surfaces similar, may be turned whenever one side begins to wear away, so as to wear less fast, and keep constantly sharp. This plough is much used where it has become known, and is approved by farmers, who have examined it here. The making costs no more than that of the common kind.

Saratoga paper.

Domestic silk.—We were not less surprised than pleased (says the Little Falls paper) to find, in a late excursion to the south, that the manufacture of silk is carried on as near as Paine's Hollow, in the town of German Flats. Mr. Philip Swift has cultivated the mulberry tree, and reared silkworms for some years past. Sixty skeins of fine silk were made last season in his family; and he has now about 1500 or 2000 silk worms busily employed. Let others of our enterprising citizens enter on the business, and it may become as profitable here as in the noted town of Mansfield, Conn. During the war, the raw silk made by a single family in a year, at the latter place, is said to have sold for one thousand dollars.

The breadfruit-tree is about to be introduced into the gardens at Chiswick, by the London Horticultural Society.

Extracts from a "Journal of a Horticultural Tour through some parts of Flanders, Holland, and the North of France, by a Deputation of the Caledonian Horticultural Society."

STEAM IN HOT HOUSES.

"For increasing and keeping steady the temperature in several of his hot-houses, Mr. Andrews has of late employed *steam*, in aid of the ordinary flues conveying smoke and heated air. The steam is carried through the house by means of metal pipes, which are laid along the top of the brick flues. The pipes are of copper, on account of its expanding less than lead. They are of a square form, and are set on edge, so that any condensed vapor trickling to the bottom may occupy but little room, or present only a small surface. As in the common steam engine, the boiler is made to regulate itself by a simple contrivance: It is furnished with a float, which descending in proportion as the water is dissipated in steam, in due time raises a valve and admits a new supply of water.—The superfluous condensed vapor also returns to the boiler, there being no other provision for disposing of it. It is scarcely necessary to add, that by merely opening a valve, the house can at pleasure be *steamed*, i. e. filled with steam, than which nothing can be more conducive to the health and vigor of plants confined in a hot-house. We were assured that seven bushels of coal would go as far in keeping up the steam-heat, as ten bushels do in maintaining an equal temperature the other way. When the aid of steam is resorted to, the temperature is found to be more easily regulated, continuing equable for a considerable length of time. Mr. Andrews, Junior, mentioned, that the furnace being duly charged, and the boiler prepared, he could with confidence leave the hot-house for eight or even ten hours together, being satisfied that the temperature would continue to be maintained for that length of time."

MARKET FOR BUTCHERS' MEAT.

"The market for butchers' meat in Ghent is kept extremely neat and clean; no offensive streams of blood are to be seen, every thing of that sort being confined to the shambles. Each dealer in meat keeps a carpenter's plane, with which he daily shaves the surface of the table of his stall, so that a stranger would be apt to think that all the tables were new."

MANNER OF FORCING RASPBERRIES.

"Raspberries are forced at Haarlem. The bushes are planted on the north and south sides of a pit filled with tanner's bark, leaves, or stable-litter. The shoots of last year were at this time laid down to a horizontal trellis [structure of wood or iron] where they had yielded fruit in the vernal months. All means of artificial heat were now (29th August) of course removed. The shoots of this year were allowed to spring upright; and these will, in their turn, be laid down to the trellis at the approach of winter, when the others will be cut away. The gardener told us that raspberry plants thus treated, yield large crops; and doubtless they are better adapted to this mode of forcing than vines."

ON RAISING NEW VARIETIES OF FRUIT.

"The experience of Mr. Van Mons, (a famous Dutch horticulturist,) confirms what has been observed by British horticulturists,—that the fruit produced by a seedling tree in the first year of bearing, affords by no means a fair criterion of its future merit. If a pear or an apple possess prom-

ising qualities, a white and heavy pulp, with juice of rather pungent acidity, it may be expected in the second, third and subsequent years greatly to improve in size and flavor; particularly if the buds, leaves, bark and wood possess the characteristics of approved bearing trees. Mr. Van Mons added a remark which we do not recollect to have met with in horticultural writings:—That by sowing the seeds of new varieties of fruits, we may expect with much greater probability to obtain other new kinds of good quality, than by employing the seeds even of the best old established sorts. He likewise gave it as his opinion, that if the kernels of old varieties were to be sown, it would be better to employ those of other countries similar in climate."

Translated from the French for the Plymouth Memorial.

ON THE CULTURE OF ROSE BUSHES.

Roses are increased by seed, buds, layers or shoots, and by grafts on other rose bushes.

The rose from the seed comes slowly; it diversifies varieties.

The most usual method to multiply roses is by buds and layers. Grafting succeeds better than budding with the choicest roses.

Plant not rose bushes either during frosts or great heat.

Dry earth causes more fragrance, and higher and stronger colours.

Moist earth, larger roses, less colour, and slower and later growth.

The rose will not flourish in pots or boxes, on account of its numerous roots.

The blooming of yellow roses may be anticipated, by pulling off the buds and leaving but a few. The hundred leaved rose will not flourish in the shade.

The white double rose stifles the growth of those near it; particularly the yellow rose.

Pruning agrees generally with every species of rose, except the yellow and the musk rose.

If rose bushes are watered with a ley made from the ashes of burnt rose bushes the salts contained in it will wonderfully contribute to their growth.

SWAMPS.

I have read of a swamp, of which meadow could not be made; and, being a disagreeable object, large deep ditches were dug, and the earth thrown up into little islands, which were planted with willows, and formed beautiful clumps of trees, here and there; so that nothing was seen but these trees, and various peeps of water. The ditches answered for fish ponds.

Lombardy poplar is planted about habitations in America for ornament; but an Italian gentleman says, in Italy it is sawed at mills, whilst green, into boards of $\frac{1}{4}$, $\frac{1}{2}$ to one inch thick, and into plank 2 to 3 inches thick; and is greatly applied to making packages for merchandize. Nails are not apt to draw in these packages, the boards whereof are thin, and the wood being tender is easily cut into thin boards with hand-saws. In 20 years their trunks, he adds, grow to be 2 feet diameter and 30 long. Boxes of it made strong for the use of vineyards last there 30 or 40 years, which induces the expectation that they may last long in *fence-rails* or logs. As *fuel*, he says it makes a much stronger fire than the willow. The weeping willow is a singular and valuable ornament. Of other willows and osiers, tho

best adapted to making baskets, hurdles, tool handles, &c. no husbandman ought to be without a permanent stock in full growth. For the more general, extensive, and important purposes, the Larch (*Pinus Larix, Lin.*) must have the first attention of landed men. See Doctor Anderson's 3d volume of Essays on Husbandry, for a full and satisfactory account of it, and of the extensive propagation of it in Scotland, with its useful and durable qualities, and its very quick growth, so much wanted in the oak.

Mr. Young speaks of fish-ponds, and of four ponds, an acre each, one above another, on a stream, which turned a mill below the ponds. 19 An. 400.

GAME IN NEW SOUTH WALES.

The following account of the sporting, &c. at Bathurst, in New South Wales, is given by a recent traveller:—"Bream is caught in all the rivers, bites very fast, and is nearly as large as the salt-water fish of the same name, caught on the coast. The cod is the most remarkable fish at Bathurst, and is not unfrequently caught as heavy as fifty, sixty, and even ninety pounds; when caught in large quantities, they are generally dried, and may be seen in this state hanging up inside the roofs of the settlers' houses. Game is plentiful: ducks, snipes, widgeon, teal, abounding near the rivers. I saw eight black ducks brought down at one shot, weighing, as I guessed, four pounds each. These are delicious eating. Sometimes the settlers will throw up a breast-work of boughs, near some favourite rendezvous of the birds, close to the water, and when they have collected near the spot, the sportsman fires from behind his battery, and does dreadful mischief among them, forty ducks having been brought down in this manner at one fire. The plover and bronze-winged pigeon are very numerous, and easily shot; the latter, especially, is a beautiful creature, and twice the size of the domestic pigeon, looks well, and eats well at table; but the best sport at Bathurst is the quail; this is the partridge shooting of New South Wales generally; but the Bathurst settlers seem to enjoy it in perfection, having a much greater scope of clean open country."

IMPORTANT ARTICLES OF TRADE.

The demand for Rattlesnakes and Alligators, for the foreign market, is steady and the trade brisk. "It is a fact, (says the Savannah Georgian) tho' perhaps not generally known, that both Rattlesnakes and Alligators are regularly reported by the Liverpool papers, as imports with Cotton, Rice, and other staple articles." Who will say after this that the United States do not beat the world all hollow in the variety and value of their productions?

It must be owned, however, that the North. ingenuous as they are in the manufacture of wooden nutmegs and pumpkin seeds, are obliged to yield the palm to the south in their articles of export; and our Southern neighbors have no reason to find fault with the tariff, while they monopolize the snake and alligator trade.—*Berkshire American.*

Dye for cotton.—Cotton at Smyrna is dyed with madder, in the following manner: The cotton is boiled in common olive oil, and then mild alkali—being cleaned it will then take the madder dye. This is the fine color we see in Smyrna cotton yarn. I have heard that the sum of five hundred pounds was given in England for this secret.

DOMESTIC ECONOMY.

Some of the leading principles in *domestic economy* may be comprised in few words. For instance—

Ready money purchases the best market.

Keep a minute account of every outlay, however trifling.

Be not tempted to purchase any unnecessary article by its apparent cheapness. If your means will allow it, do not buy in very small quantities articles in constant family use, and which are not perishable.

GUATEMALA.

The condition of this country, as described by Mr Dunn, is deplorable. The population is composed of European Spaniards, Creoles or Americans descended from Spaniards, Indians, negroes, mulattoes, mestizoes, &c. The whites are divided into two parties—one aristocratic and superstitious; the other republican, but of the French revolutionary school. The mulattoes and other mixed races form the physical force of the nation. With some exceptions, all are ignorant, corrupt and licentious. Guatemala, is, perhaps, the only country on earth where *females carry daggers* in the garters of their stockings for the purpose of stabbing their fellow creatures.

Intoxicating liquors are the great source of the wretchedness and degradation of the people in Guatemala, as well as in some other countries.

Habits of intoxication prevail among the lower classes; the multitude of spirit shops offer powerful temptations, and the liquor is sold so cheap that the poorest Indian can become beastly drunk when he pleases. "These wretched creatures," says Mr Dunn, "may be seen rolling about the streets and suburbs, in a state sometimes approaching to madness, and sometimes to insensibility under its overpowering influence."—*Harp. Gazette*.

VINEGAR FROM HONEY.

If a pound of honey be dissolved in three or four quarts of water, and exposed to a temperature between the 70th and 80th degrees of Fahrenheit's thermometer, it will in a short time become a very agreeable acid liquor, which possesses an aromatic flavor, and strength superior to that of the best wine vinegar made of white wine.—*Domes. Econ.*

THE SOUTH WEST WIND.

The following beautiful passage is from one of the published sermons of the Rev. Dr. Freeman, of this city: The south-west is the pleasantest wind which blows in New England. In the month of October, in particular, after the frosts, which commonly take place at the end of September, it frequently produces two or three weeks of fair weather, in which the air is perfectly transparent, and the clouds which float in the sky of the purest azure, are adorned with brilliant colors. If at this season a man of an affectionate heart and ardent imagination should visit the tombs of his friends, the south-western breezes, as they breathe through the glowing trees, would seem to him almost articulate. Though he might not be so wrapt in enthusiasm, as to fancy that the spirits of his ancestors were whispering in his ear; yet he would at least imagine that he heard the still, small voice of God. This charming season is called the Indian summer, a name which it derived from the natives, who believe that it is caused by a wind, which comes immediately from the

court of their great and benevolent god Cautantowit, or the south-western, god, the god who is superior to all other beings, who sends them every blessing which they enjoy, and to whom the souls of their fathers go after their disease.

INTERNAL IMPROVEMENTS.

The Vermont Chronicle has recently published a valuable table of all the Canals and Rail Roads, completed or in progress in the United States.—Among those completed, are the Middlesex Canal between Boston and Chelmsford, twenty nine and a half miles long—Hudson and Erie, between Albany and Buffalo, three hundred and sixty three miles—Champlain, Albany and Whitehall, sixty three miles—Oswego, connecting the Hudson and Erie Canal, thirty eight miles—Seneca, connecting Seneca and Cayuga Lakes with the Hudson and Erie Canal, twenty miles—Chesapeake and Delaware, from Delaware river, fourteen miles—Port Deposit to the Delaware line, ten miles—Schuylkill, Philadelphia, to Mount Carbon, one hundred and eight miles—Union, from Reading, to Middletown, seventy nine miles—Disenl Swamp, near the mouth of James River, to Albemarle Sound, twenty three miles. There are ten other Canals in progress and eleven others projected.—Of the Rail Roads enumerated, two are finished, one nearly completed, and nine projected.—*Salem Observer*.

Ploughmen.—To train ploughmen to habits of activity and diligence is of great importance. In some districts they are proverbial for the slowness of their step, which they teach their horses, whereas those animals if accustomed to it, would move with as much ease to themselves in a quick, as in a slow pace. Hence their ploughs seldom go above two miles in an hour, and sometimes even less; whereas, where the soil is light and sandy, they might go at the rate of three miles and an half. Farmers are greater sufferers than they imagine, by the habitual indolence of their workmen, which extends from the plough to all their other employments, for it makes a very important difference in the expense of labour. Where the land, however, is stiff and deep ploughing is necessary, the operations ought not to be too much hurried.—*Code of Agriculture*.

Mode of preserving butter.—The following is taken from the journal of a Turkish traveller:—The butter which is mostly used in Constantinople, comes from Crim and the Kuban. They do not salt it, but melt it in large copper pans over a very slow fire, and scum off what rises; it will then preserve sweet a long time if the butter was fresh when it was melted. We preserve butter mostly by salt. I have had butter, which when fresh was melted and skimmed in the Tatar manner, and then salted in our manner, which kept two years good and fine tasted. Washing does not so effectually free butter from the curd and butter-milk, which it is necessary to do, in order to preserve it, as boiling or melting; when the salt is added to prevent the butyraceous part from growing rancid, we certainly have the best process for preserving butter. The melting or boiling, if done with care, does not discolor or injure the taste."

At a late meeting of the Royal Institution, a piece of cambric was exhibited, said to be made from the bark of the pine-apple tree in China.

SEA WEED FOR MANURE.

Ore weed, sea weed, sea ware, or sea wreck.—These names are applied to all the vegetables which grow plentifully in the sea, and on the muddy and rocky parts of the shore below high water mark.

The sorts are chiefly three; the kali, or rock-weed, which strongly adheres to rocks, and which is allowed to be of the greatest value for manure. The alga, called eel grass, or grass wreck, is of the next rank as to its richness. But there is another sort, consisting of a broad leaf with a long shank or stem, of an inch diameter, by some ignorantly called kelp; this is said by Sir A. Purves to be of the least value of any of the sea weeds. However, none of them are unimportant for fertilizing the earth.

All vegetables when putrefied are a good pabulum for plants; for they consist wholly of it. But the value of marine vegetables is greater than that of any other; for, besides the virtues of the other, they contain a large quantity of salt, which is a great fertilizer. Mr. Dixon thinks those weeds which grow in the deepest water are the best.—Perhaps they contain a greater proportion of salt than those which grow near the shore, as they are seldom or never wetted with fresh water.

A great advantage that these plants have above any other, is their speedy fermentation and putrefaction. The farmer has no need to wait long after he has got them, before he applies them to the soil. The rock weed may be ploughed into the soil as soon as it is taken from the sea. This is practised in those parts of Scotland which lie nearest to the shore; by which they obtain excellent crops of barley, without impoverishing the soil.—Neither have they any occasion for following to recruit it. In hills of potatoes, it answers nearly as well as barn dung. I have known some spread it upon young flax newly come up, who say it increases their crops surprisingly. The flax may grow so fast, and get above this manure and shade it, so soon, as to prevent evaporation by the sun and wind; so that but a small part of it is lost;—and flax is so hardy a plant that it does not suffer by the violence of the salt, like many other young plants.

But I rather think it is best to cure the sea weed, before they are applied to the soil. This may speedily be accomplished by laying them in heaps. But the heaps should not be naked. Let them be covered with loose earth or turf; or else mixed with it, changing to a salt oily slime, very proper to fertilize light soils, and not improper for almost any other.

As to the eel grass, &c. the best way is to cart it in autumn into barn yards, filling the whole areas with it, two or three feet deep. It may be either alone, or have a layer of straw under, and another above it. When it has been trampled to pieces by the cattle, and mixed with their stale and dung, it will be the fittest to be applied to the soil. It being a light and bibulous substance, it will absorb the urine, which is totally lost by soaking into the earth, unless some such means be laid under cattle to take it up, and retain it.

Farmers who are situated near to the sea shore have a great advantage for manuring their lands. If they were once persuaded to make a spirited improvement, they might enrich their farms to almost any degree that they please. They should visit the shores after spring tides and violent storms, and with pitchforks take up the weeds, and lay

them in heaps a little higher up upon the shore ; which will at once prevent their growing weaker, and secure them from being carried away by the next spring tide.

Many are so situated that they can drive their carts on a sandy, hard beach, at low water, to the rocks ; and fill them with weeds. Can they be so stupid as to neglect doing it ? It is even worth while to go miles after this manure with boats, when it cannot be done more easily. It has often been observed that muzzling with sea weeds is an excellent antidote to hawthorn. It is so, not only in the ground, but also upon trees. I have an orchard which has been for many years much annoyed by caterpillars. Last spring, about the last of May, I put a handful of rock weed into each tree, just where the limbs part from the trunk ; after which I think there was not another nest formed in the whole orchard. April is a better time to furnish the trees with this antidote to insects. And the month of March is perhaps better still.

Putrefied sea weeds should, I think, be used for crops of cabbages, and turnips, and for any other crops which are much exposed to be injured by insects.

One disadvantage attending the business of farming in this country, is, that our cold winters put an entire stop to the fermentation, and putrefaction of manures. This may be in some measure obviated by the use of rock weed, which is so full of salt that it is not easily frozen : Or if frozen, it is soon thawed. I have been informed that some have laid it under their dung-hills by the sides of barns ; in which situation it has not frozen ; but by its fermentation has dissolved itself, and much of the dung that lay upon it. There is undoubtedly a great advantage in such a practice.

Another advantage of this kind of manure, which must not be forgotten, is, that it does not encourage the growth of weeds so much as barn dung. It is certain it has none of the seeds of weeds to propagate, as barn dung almost always has. But some suppose that its salt is destructive to many of the seeds of the most tender kinds of plants ; if it be so, it is only when it is applied fresh from the sea, at the time of sowing. But even this is doubtful.

This manure is represented in the Complete Farmer to be twice as valuable as dung, if cut from the rocks at low water mark ; that a dressing of it will last three years ; and that fruit trees which have been barren are rendered fruitful by laying this manure about their roots.—*Deane's N. E. Farmer.*

DISEASE OF SILK WORMS, AND ITS CURE.

In the southern provinces of France, where silk worms are bred, it is very common to find them attacked by a disease, called the jaundice, in consequence of the color acquired by them ; and very careful examination is continually made for the discovery of such worms as are attacked by it, that they may be removed. For the disease, being contagious, should spread to others. The Abbe Cyseric, of Carpentras, had recourse to a remedy in these cases, which though apparently dangerous, has been warranted by the success of twenty years. He used to powder his worms over with quick lime, by means of a silk sieve ; he then gave them mulberry leaves moistened with a few drops of wine, and the insects instantly set about devouring the leaves with an eagerness which they did

not usually show ; not one of the hurdles upon which he raised his worms appeared infected with the jaundice. It was at first supposed that the cocoons of silk were injured by this process ; this however is not the case, and his method of practice is now adopted generally in the department of Vaucluse.

THE CROPS.

We have again had rain every day last week. similar weather is certainly not in the recollection of the oldest inhabitants.

The grain crop in this District, nevertheless, if the weather settles, of which there is no certain indication, may prove an average. On low lands, and those not in good heart, it can now only ripen late, and it must be exposed to the frosts which are always more frequent in rainy seasons than in dry. It has generally shot into ear. Where the soil has not been too wet, the straw is abundant, and will assist in making up the deficiency of hay which it is now certain must be much below the average. If the present weather continue it will be found very difficult to secure the greater part of the crops ; and already the little that has been mowed remains exposed, or has been secured in an indifferent condition. The potato crop is backward, and whatever may be the quantity, the quality must be indifferent. The turnips have escaped the ravages of the fly, which has in this neighborhood at least, done very little injury, although in the lower parts of the District, in some places, it has almost totally destroyed the wheat. The gardens have pretty generally been productive ; the crop of fruit will be an average one, but the period of maturity will be later than usual.—*Quebec Gazette, of July 28.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 15, 1828.

We invite the attention of the public to the able and interesting document, relating to the state of the Botanic Garden at Cambridge, given in this day's paper ; which will, it is confidently anticipated, not only elicit the attention of the public at large, but call into action that liberality for which the citizens of Boston, and those who inhabit its vicinity, have ever been so honorably distinguished. Contributions to such an object will be eminently beneficial to the contributors ; and be the most direct method of enabling our countrymen to avail themselves of those vegetable treasures, with which NATURE has enriched, and ART may embellish the "happy land we live in."

TO PREVENT COWS FROM CONTRACTING BAD HABITS WHEN YOUNG.

Cows should always be treated with great gentleness, and soothed by mild usage, especially when young and ticklish, or when the paps are tender, in which case the udder ought to be fomented with warm water before milking, and touched with the greatest gentleness, otherwise the cow will be in danger of contracting bad habits, becoming stubborn and unruly, and retaining her milk ever after. A cow never gives down her milk pleasantly to the person she dreads or dislikes. The udder and paps should always be washed with clean water before milking ; but care should be taken that none of that water be admitted into the milking pail.

EGG PLANT.

Mr P. B. Hovey, of Cambridge, has left at the New England Farmer office, some of the fruit of the Purple Egg Plant, which measures sixteen inches in circumference ; raised from seed sold at this place.

ON COWS GOING DRY TOO SOON.

If at any time a good milk cow should go dry before her milk is gone, get a young calf, and put it to her, in order to preserve her milk against another year ; for it is well known, if a cow goes dry one year, nature will lose its power of acting in future.—*Bath Papers, vol. 2, p. 294.*

MILCH COWS SHOULD BE WELL KEPT.

The keeping of cows in such manner as to make them give the greatest quantity of milk, and with the greatest clear profit, is an essential point of economy. Give a cow half a bushel of turnips, carrots, or other good roots per day, during the six winter months, besides her hay ; and if her summer feed be such as it should be, she will give nearly double the quantity of milk she would afford if only kept during winter in the usual manner, and the milk will be richer and of better quality.

The carrots, or other roots, at nineteen cents per bushel, amount to about eighteen dollars. The addition of milk, allowing it to be only three quarts a day for three hundred days, at three cents per quart, amounts to twenty-seven dollars. It should be remembered, too, that when cows are thus fed with roots, they consume less hay, and are less liable to several diseases, which are usually the effects of poor keeping.—*Farmer's Assistant.*

Thomaston.—This is the greatest mart for lime in the United States. The rock from which the lime is made, appears to be diffused over this town and Camden, the town adjoining. It is supposed 150,000 barrels are made in these two places in a year, but it is now so low in price, that it is scarcely worth the trouble of making and transporting it.

Bees.—E. Britton, Esq. of Little Falls, has now more than three hundred swarms of bees ; two hundred of them young swarms, and all doing well. It is doubtful whether there are many individuals who can produce the like number.

The Greeks ascribe the invention of hours to Anaximander, who probably received it from the Chaldeans. It has recently been ascertained that the division of the day into hours was known to and adopted by the Hindoos from their earliest ages.

The *Morning Herald*, in its report of the first day's meeting at Ascot, states that, when the rain fell during the day, seven acres of umbrellas spread their protecting influence over the mass of spectators.

4,081,017 yards of domestic cotton goods were cleared from United States ports for ports in the Pacific, to the southward of California, in twenty-eight vessels, in nine months ending in Jan. last.

We regret to learn that in some parts of the country the wheat is coming into ear very unfavourably.

William Lee, Esq. who has recently arrived in Leeds from France, has brought a small quantity of the seed of the cow-cabbage, which he had distributed amongst his acquaintance, in order to have a fair trial made as to its adaptation to this climate. The introduction of this tree cabbage may be of essential service to the community. In Plymouth it has been seen growing in the garden of Admiral Brooking to the height of eight feet, and in La Vendee it attains an altitude of from 12 to 16 or even more feet. It should be planted in a warm and sheltered situation; sixty plants are said to afford sufficient provender for one cow for a year, and as the side shoots are only to be used, it lasts four years without fresh planting.—*London paper.*

Some years since, a letter written in Arabic, was sent by the Emperor of Morocco to the King of England; but no person could be found in Britain to translate it. The same thing happened in the United States with respect to a letter from the Bey of Algiers to the President Madison. The French maintain a body of young men in Africa and Asia to learn the local languages, who if they prove good, are eventually made Consuls. With similar views President Adams attached young Mr. Hodgston, of Virginia, to Mr. Shaler's mission to Algiers. He has become a proficient in Arabic, and is Charge d'Affaires at Algiers. Mr. H. has discovered that the Berber language in Africa, is the Numidian; that of Syphax, Juba, and Masinissa.

A singular phenomenon has lately presented itself in the horse-bean. The maggot, which, it would appear, must have been very numerous last season, having secreted itself in the grain, changed into the aurelia of a small black fly, and is at this period eating its way out. We have witnessed several proofs of this circumstance in one sample, and it may be doubtful how far they are wholesome for horses until the bean is broken, when the fly becomes animated, and instantly commences its escape.—*Essex Herald.*

Substitute for ringing swine.—To prevent swine from digging in the soil, the best method is to cut the two tendons of their snouts with a sharp knife, about an inch and a half from the nose. This may be done with little pain, and no prejudice to the animal, when about two or three months old. Common practice of restraining them by rings fixed in the snout is painful and troublesome;—they must be replaced as often as they give way, and that happens so frequently, that rings afford but little security against the nuisance.—*London.*

Last year a poultry salesman in London sold 19,047 head of game. So much for prohibitory laws at variance with public opinion.

It has been stated to us that the quantity of fish transmitted from this port to the London market is so immense, that the carriage alone amounts to nearly £1000 annually.—*Boston (Engl.) Gazette.*

The ensuing Horticultural Fete is contracted for at a guinea per head; last year the appetites of the company were measured at nine shillings.

Invention.—A gentleman in Birmingham has invented a music desk, to which is attached machinery turning over the leaves of the music book, without taking the fingers from the instrument.

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr. Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordeaux, Clerac, and Buzet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1828.

Mr. A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1/2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each for 1000 or more; 12 1/2 cents for less than one 1000; and 15 cents for less than 50 roots.—Payment to be made on delivery of the roots.—Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 35 Wall street—Boston, E. Copeland, Jr.—Albany, R. M. Michael—Philadelphia, Van Amringe—Baltimore, Wollard Rhoads—Washington City, Wm. Paro.—Richmond, Davenport, Allen & Co.—Savannah, Hall, Shafter & Tupper—New Orleans, Foster & Hutton—Charleston, (S. C.) J. & J. Street & Co. Mr. A. Loubat's book on the Culture of the Grape Vine and on the Making of Wine, may be found at the principal booksellers of the United States; and his agents will furnish them gratis to subscribers.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturists in the vicinity of Boston and New York, is just published by J. B. Russell, Proprietor of the New England Farmer. The articles are arranged alphabetically, and comprise the most useful VEGETABLES and FRUITS which can be conveniently and economically cultivated in the climate of New England and the Middle States; as well as a Treatise on FLOWERS, and on LIVING APPLES or PLEASANT GARDENS, on the general management of the Sick Worker, and the manufacture of SILK, and a Treatise on the culture of GRAPES, VINES and the STRAWBERRY. The article on Fruit Trees contains an enumeration and description of all the Apples, Peaches, Cherries, Plums, Nectarines, Apricots, &c. &c. that can be raised to the most advantage, and their relative forwardness in bearing which will be found to be of inestimable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written.

A list of the contents of the work will be found in the New England Farmer for August 1.

Besides a faithful investigation of all the standard works on Gardening and Horticulture, recently published in England, and the Transactions of the London Horticultural Society, the New American Gardener is enriched by notices or extracts from the writings of the following American gentlemen:

J. Arnsperg, Jesse Buel, L. Bartlett, L. W. Briggs, Joseph Cooper, Am. Cox, J. G. Coffin, T. Coalter, S. Greene, R. H. Derby, B. A. S. Dearborn, Doct. Brown, Jared Elliot, J. Ellis, O. Fisher, Doct. Green, J. M. Gougeon, R. Howard, T. W. Harris, T. Hubbard, L. McKean, J. Kenrick, John Lowell, H. Lathrop, A. Lindrum, J. Mease, B. M. Mahon, F. A. Michaux, Wm. Moody, E. Preble, J. H. Powell, L. Peterson, R. W. Pomeroy, W. D. Peck, T. Pickering, E. Perley, A. P. Pennington, J. W. Proctor, S. G. Perkins, Professor Say, Doct. J. Spafford, Josiah Quincy, James Thacher, R. Treat, I. Tucker, R. Tuckey, W. Wilson, N. Webster, J. P. Wingate, J. W. Watkins, Benjamin Wheeler.

Price \$1.25—Six copies for \$6.00.

Seeds for Fall Sowing.

For sale at the New England Farmer Seed Store, a fresh supply of various Grass Seeds—also a great variety of vegetable seeds for fall sowing, viz. White Portuguese Cucumber, Strasbourg do, Silver-skin do, Pockly Spinach and Dutch Cole for early greens—various kinds of lettuce, carrot, cucumber, cabbages, &c.—black Spanish or winter radish, &c. all warranted fresh.

Orchard Grass Seed—growth of 1828.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, 20 bushels of prime Orchard Grass Seed, raised, this season, with the greatest care, by John Prince Esq.—warranted to be equal in purity to any ever offered for sale in New England. A supply of pure Gilman Wheat, raised by Payson Williams and Mr. Winchester, is daily expected.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Farmer Wanted.

An intelligent, capable man is wanted to take charge of a Farm a few miles from the city. He must be able to produce undoubted references, as to his knowledge of the business, habits of industry, &c. With one having the requisite qualifications an arrangement might be made for taking the farm on shares.

FOR SALE.

An excellent Mare with her Colt, by the celebrated Horse Bell-founder. Also, a Filly, two years old, by Denton—perfectly kind and good tempered. Likewise, one full blood Merino Ram, one Ewe, and one Lamb. Apply at the office of the N. E. Farmer. aug. 3

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D." Boston through the post-office. 6t Aug. 4

Oat Meal, Oat Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine bolted Oat Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few canisters of fine Oat Flour, neatly packed, at 50 cts. per canister.

A Good Companion.

Is wanted at the New England Farmer office.

MISCELLANIES.

From the New England Farmer's Almanack for 1829; now in the press of J. B. Russell, proprietor of the New England Farmer and Horticultural Journal.

For the Calendar pages for the month of August, are the following lines; by T. G. Fessenden.

HARVEST-INTEMPERANCE

The acable fields and gay meadows to hold,
And laughing luxuriant landscape accord,
In tributes of verdure, enamell'd with gold,
The hard-handed husbandman's promis'd reward

But pause ere you gather the bountiful crop,
And listen to well meant advice of a friend.
The evils which flow from intemperance stop,
So far as your own good example may tend.

Avoid the inveterate habit of some,
(Excessively foolish, atrociously sinful.)
Now debauched with brandy, now reeling with rum,
Now snuffing with whiskey a spanish brown skin fall

With the fire of the elements raging without,
If the fire of the still is consuming within,
A body of adamant soon must give out,
As the sea-sinew'd laborer soon must give in.

A man had much better be burnt at the stake,
For thus he will finish his troubles much quicker,
Than his own carcase take a blue blaze to make,
And be burning for years with the fire of strong liquor.

They who are easily flattered are always easily cheated.

The petty vexations of life are like beggars; if you treat them kindly, they "call again;" but if you kick them from your door, they will be very likely to cut your acquaintance.

Silence is the best remedy for anger. If you say nothing, you will have nothing to unsay.

A man without wisdom is like a cat without whiskers, liable to thrust his head into a hole where he cannot draw his hanches through.

True pith.—The force of language is apt to be much injured by the multitude of words. A respectable firm in this has the singular happy talent of not saying too much. A young man wishing to obtain his consent to marry his daughter, called upon him one day when he happened to be in the field ploughing with his oxen. It was, past all doubt, a fearful matter for a diffident man to broach, and the hesitating lover, after running a parallel with the furrow several times round the field, and essaying with all his courage to utter the important question, at last stammered out,

I—I—I've been thinking, Mr. —, that—that as how I—I—I should be gl—gl—glad to—to—to—m—m—mar—marry your daughter.

FARMER—Take her and use her well—whoa, haw, Buck.—Berks. Am.

"Four and twenty Fiddlers" in a Whal's Belly.—An entertainment has been given by Mr. Kessels, the naturalist of Gand, for the purpose of exhibiting an enormous whale, which M. Cuvier and others think must have reached the age of 9 or 10 centuries. The orchestra was arranged in the interior of the stupendous animal, and there were 24 performers.—*London Weekly Review.*

An Irish gentleman being taken ill of a yellow fever at Jamaica, a lady who had married in that

island, indirectly hinted to him in the presence of an Irish physician who attended him, the propriety of making a will in a country where people were so apt to die—the physician thinking his judgment called in question, tartly replied, "By St. Patrick, madam, I wish you would tell me where people do not die—and I will go and end my days there."

This puts us in mind of a Hibernian minister who said during one of his sermons, that if there was no such thing as death in the world, we should increase to such a degree, that the plague would get among us, and we should die off by thousands!!!

Flatterer.—A flatterer is said to be a beast that bitheth smiling. But it is hard to know them from friends, they are so obsequious and full of protestations; for, as a wolf resembles a dog, so doth a flatterer a friend.

Longevity.—Mary Fish, (who was born on a passage from Africa to this country in 1707,) died a few days since, in Dorchester county, State of Maryland—having attained the hundred and twenty-first year of her age.

A London hatter advertises having invented a porous hat, to remedy complaints made against water proof hats of preventing the escape of perspiration and causing headache. The inventor must have been a relative of the Irishman who made a hole in his shoe to let the water out.

THE YANKEE AND DUTCHMAN.

The N. Y. Commercial Advertiser relates the following anecdote of a Yankee pedlar, and a Dutch Inkeeper, near Catskill.

After some sporting and bantering between Mynheer and Jonathan, who had shown off some common slight of hand tricks, the said Jonathan declared that he could swallow his robust host! Notwithstanding that Jonathan had already played off several of his Yankee tricks which puzzled the good people exceedingly, yet the assertion was too great a mouthful for them to swallow, if the pedlar could. A bet sufficient to moisten the throats of the whole company, was the consequence between the principal parties, though the landlord, in proposing it, had no idea that his customer would accept, when, as he supposed, he must be certain of losing. Jonathan then directed that Mynheer should be divested of his coat and boots, and be stretched longitudinally upon the old oaken table which had stood in the bar-room for half a century. These arrangements having been made, Jonathan voraciously seized upon the honest landlord's gouty great toe, which he pressed rather violently between his teeth, giving the good man a twinge which caused a writhing movement and a groan. "Dunder and blixum!" exclaimed Mynheer: "Wat te fefil do ye pite me sho for?" "Why, you darn'd great fool," said Jonathan, "You didn't think I was going to swallow you whole, did you?" A burst of laughter proclaimed Jonathan the victor, and Mynheer had to pay the toast and toddy.

Patrick Henry.—When Patrick Henry, who gave the first impulse to the ball of the American revolution, introduced his celebrated resolution on the stamp act into the House of Burgesses of Virginia (May, 1765,) he exclaimed, when descanting on the tyranny of the obnoxious act, "Cesar had

his Brutus; Charles the First his Cromwell; and George the III?"—"Treason!" cried the speaker; "treason, treason!" echoed from every part of the house.)—It was one of those trying moments which are decisive of character. Henry flattered not for an instant; but fixing on the speaker an eye flashing with fire, continued, "may profit by their example. If this be treason make the most of it."—*Percy Anecdotes.*

Original Anecdote.—In one of our country taverns a few years since, there happened to be a number of respectable farmers clad in the usual habit, when a spruce young gentleman came in, rigged in the highest style with a watch in his pocket, who strutted around the room with great pomp, dinging his gold watch keys and seals in the most foppish manner. After swaggering about the room a few minutes, he cried out and challenged any man in the room to drop money with him, one piece at a time, and the one whose purse held out the longest should take the whole and treat the company. No one at first appeared disposed to accept his challenge, which only tended to render the fop more inflated with an idea of his superior wealth, and he became the more earnest. At length, a rusty looking, but shrewd old farmer observed, if no one else would accept of his offer, he would do it. "It is done," said the fop, and immediately called on a third man to hold the hat, and commenced the game, by dropping a piece of money into the hat. The former then put his hand into his pocket and took out what was called a bung-town copper, and dropt it into the hat. The fop immediately dropt in his second piece, when the farmer, feeling in his pockets after another piece, but finding none, gravely observed, "I own you beat, I've got no more—you may take the whole and treat the company."—*Trent. Emp.*

Curiosity.—Large flocks of swallows are daily seen on the small bridges on the turnpike between Chelsea and Lynn. On the bridge nearest to Lynn may be seen at all hours of the day one which mixes with the rest in color perfectly white. For several days past it has been noticed with much pleasure by the passengers passing in the different stages.—*Contin'd.*

DISTRICT OF MASSACHUSETTS, to wit:

District Clerk's Office.

Be it remembered, That on the eighteenth day of July, A. D. 1828, in the fifty-third year of the Independence of the United States of America, J. B. Russell, of the said district, has deposited in this office the title of a book, the right whereof he claims as proprietor, in the words following, to wit:

"The New American Gardener; containing practical Directions on the Culture of Fruits and Vegetables; including Landscape and Ornamental Gardening, Grape Vines, Silk, Strawberries, &c. &c. By Thomas G. Fessenden, Editor of the New England Farmer.

"God Almighty first planted a Garden; and indeed it is the purest of human pleasures; it is the greatest refreshment to the spirits of man; without which buildings and palaces are but gross handy-works.—Paeon's Essays."

In conformity to the act of Congress of the United States, entitled, "An Act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies, during the times therein mentioned;" and also to an act, entitled, "An Act supplementary to an act, entitled, An Act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies, during the times therein mentioned; and extending the benefits thereof to the arts of designing, engraving, and etching historical and other prints. JNO. W. DAVIS, Clerk of the District of Massachusetts.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. PESSENDEN, Editor.

VOL. VII.

BOSTON, FRIDAY, AUGUST 22, 1828.

No. 5.

AGRICULTURE.

We publish the following extract of a letter from a gentleman in Washtenaw County, Michigan, to the Editor of the New England Farmer, as a good comment on the beneficial effects of Internal Improvement. Who would have predicted two years since, of a cargo of Flour being sent from the interior of Michigan to Boston, and sold profitably at 5 or 6 dollars per barrel. We recollect the anecdote of twenty barrels of grain being sent from New York city to Sacket's Harbor about sixteen years since. It was of course transported in wagons; *eight* barrels of the grain were consumed by the horses on their journey—*four* left for the use of the troops—and *eight* more retained for the horses on their return.

"The regularity with which I receive the New England Farmer, merits something besides a mere acknowledgement. But money is so extremely scarce here, that I shall be under the necessity of deferring payment until fall, when I intend to make a shipment of Flour to Boston, when you can take, on account, two barrels of our Michigan which you will find not inferior to the best Genesee Flour. Our wheat harvest has been favorable this season, and the weather fine for harvesting it: and, above all, we have been blessed with a remarkably healthy season."

GATHERING WHEAT.

Mr PESSENDEN—I saw in a late New England Farmer, the method the English sometimes adopt to cut their wheat. I believe (for I have not the paper before me) the New Encyclopedia is credited therefor, as it respects the description. Having for several years past either cradled or mowed my wheat, the method abovementioned appeared to me so reasonable, at the same time so simple, that with one hour's work I was enabled to bring it into operation, much to my profit and satisfaction. I found on trial that one of the bows could be dispensed with, by adding a preventer brace, or regulator, thus:

The English, it would seem, have the standing grain on their left. On trial I found it had better stand on the right, the same as grass, with a boy to follow to place the grain which the scythe leaves, at an angle of 15 degrees to the direction of the mower. The bow may stand at a right angle with the scythe and regulated by the brace according as the grain stands, or leans: its length, according to the length of straw to be cut; mine is about 20 inches from the heel of the scythe.—Three small holes the size to receive a rake bow, is all that is needed in the snead made use of for grass, as the bow and brace can be taken out in a moment.

The acre of wheat cut by me the present season was strawed sufficiently large, for 40 bushels, had not our abundant rains beat down half the field where the straw was most abundant and at a season when the kernel had but half filled.—The crop is a good one, however, as the sample accompanying this will declare. This wheat is

known by the name of the GILMAN WHEAT, its great product having drawn the premium six years in eight. I was a little more than seven hours in cutting the acre. Four men with sickles would probably have been a longer time, with a further loss of twice the heads or ears where the grain was lodged. As the scythe was laid close to the ground (the field having been rolled in the spring, after picking off the larger stones) the rakes followed the binding, thereby saving all. To have cradled it would have been impossible.

As an apology for troubling you with this, the writer will merely mention his conviction for years, that the agriculture of New England must rise, or her hardy sons must fall.

Yours, &c.

Fitchburg, Aug. 15, 1828. P. WILLIAMS.

FOR THE NEW ENGLAND FARMER.

INSECTS.

Mr PESSENDEN.—I take the liberty to send you a limb of an apple tree, with an animal, with eight or ten legs, two and a half inches long, which stuck so fast to the limb, that the person who cut it off, thought the limb was affected with the canker, and in cutting it off, the animal to his great surprise moved. As no one in this neighborhood ever saw an animal of this kind before, I thought it might be a public benefit, to have some agricultural gentleman examine it, and if any thing new, to have a description of it made public.

A SUBSCRIBER.

Newburyport, Aug. 5, 1828.

On the receipt of the above, we forwarded the insect together with the limb of the apple tree, to which it was attached to Dr. T. W. HARRIS, of Milton, Mass. whose investigations as a naturalist, and entomologist, have been highly honorable to himself, and essentially serviceable to the interests of agriculture. Dr. HARRIS, in reply, sent the following communication, which will be read with an interest, proportioned to the science and the utility of the suggestions it develops:

THOMAS G. PESSENDEN, Esq.

DEAR SIR.—Your note of the 6th inst. was received on Saturday evening. The box with its contents, sent you from Newburyport, arrived safely. The insect, which was a caterpillar, belonging to the nocturnal Lepidoptera, had formed its cocoon beneath the cover of the box, and was already changed to a chrysalis, in which state it will probably remain until next spring. Should it however, become a perfect insect before that time, (as is sometimes the case) you shall be informed of it, and of the genus to which it belongs, which cannot till then be determined.

The cocoon, or rather demi-cocoon, resembles brown paper in color and texture, and has intermingled, in its construction, a few hairs evidently derived from the body of the caterpillar. In form it is oblong, ovoid, and flattened: and is complete only on one side, the corresponding side being replaced by the cover of the box. By making a hole through the box above, I was enabled to see the chrysalis, which is of the common shape, and about one inch long. It was alive and moved its tail very briskly when disturbed.

The caterpillar undoubtedly fed on the leaves of the tree on which it was discovered. It appeared to have ceased feeding, having fixed itself firmly by its feet to the bark of the tree, preparatory to covering itself with its cocoon.

It will be well to apprise your readers that the second brood of *slug worms* will shortly appear, some of them as soon as the 15th. of the present month. The first brood was numerous, and according to former experience, the second will greatly exceed it in numbers. Those who have young and valuable trees had best immediately provide themselves with the simple apparatus for sifting ashes, &c. on the leaves, as recommended by Mr Lowell.

You may have observed that the squash and other cucurbitaceous vines frequently die, during this month, down to the root. On examining the stalk, near the root, you may discover a small whitish grub, which lives in the centre, and is the cause of this premature decay. The grub, when it has attained its full size, is about one inch long: it then enters the ground, forms a cocoon of coarse silky substance covered with grains of earth, and becomes a chrysalis. This survives the winter, and about the last of June or first of July the perfect insect is disclosed. It is nearly related to the Peach-tree insect, and belongs to the same genus. It does not appear to have been described by Linnaeus nor Fabricius. Still, as I have not access to many of the works containing descriptions of American insects, I cannot confidently pronounce it to be a new species, and therefore give it a specific name provisionally, only till it shall prove to be entitled to an *older* one.

Egeria Cucurbitae.—Body tawny, with four or five black dorsal spots; anterior wings olivaceous-brown; posterior wings, except the margin and nervures, hyaline; tibiae and tarsi of the hind legs densely fringed with fulvous and black hairs. Length of the body three-tenths of an inch. The wings expand one inch and one quarter.

The above brief description will serve to identify the female, and the specific name will indicate the genus of plants on which the larva feeds.

On the 10th of July I observed one of these insects in the act of depositing her eggs. She continued flying and frequently alighting near the roots of the vines, and each time she alighted bent the tail downwards to drop an egg. So intent was she in this business, that she suffered me to approach very near and remain watching her a long time without being alarmed.

As the eggs are deposited and the larvæ make their first attacks near the root, it may be suggested to your agricultural friends, that, possibly, smearing the vines round their roots with blubber oil may repel the invader. The experiment, to be successful, should be made early in July.

The autumnal caterpillar, or, as it is commonly called, *web-worm*, has made its appearance in great numbers. Not only our forest and ornamental trees, but our fruit trees are now disfigured with their webs. The eggs are deposited in a cluster on a leaf near the extremity of a branch. The young larva when hatched (which happens from the last of June till the middle of August, some broods being early, others late,) cover the upper

surface of the leaf with a web, beneath which they feed in company, devouring only the upper cuticle and parenchyma of the leaf, leaving the lower cuticle and nervures untouched. As they increase in size, they progressively extend their web downwards, till, eventually, it covers a large portion of the branch. The full grown caterpillar is about one inch and one eighth long, and is of a yellowish colour, the back covered with contiguous black spots and a double series of small black tubercles, and the sides with several rust coloured tubercles. From the tubercles proceed thin bunches of diverging, slender, whitish, bearded hairs, intermingled with a few black ones.—The head and feet are black. When it has ceased feeding, the caterpillar leaves the tree, and, in some secure place, forms a thin cocoon, in which it becomes a pupa, and remains dark to the winter. In the following June it makes its escape, and is then a small white miller or moth, frequently seen round houses in the evening. It belongs to the genus *AMELIA*, and the species has not, to my knowledge, been described. It may, therefore, for the present, be denominated, from its well known habit, *the weaver*, or *AMELIA TAYLOR*. Body and wings white, immaculate; anterior thighs tawny; feet blackish above. Length of the body rather over half an inch, expansion of the wings one inch and two-fifths.

Such being the habits and metamorphoses of this insect, it is apparent that, at no time, can they so well be attacked, with the view of arresting them in their destructive career, as when the larvae are small, and the webs just begin to appear. The leaf or leaves which then support them should be stripped off, and their inhabitants be immediately crushed or burnt, without being suffered to disperse.

The description of our supposed milder, eript destructive insects might be greatly extended, but this paper is already sufficiently prolix, if not tiresome both to yourself and your readers.

You will please, whenever you wish, command the services of your humble servant,

T. WM. HARRIS.

Milton, Aug. 11, 1828.

FOR THE NEW ENGLAND FARMER.

GRAPE VINES.

MR. FESSENDEN.—I perceive by your paper of the 15th inst. that one of your correspondents under the signature of "J. B." says that he has succeeded very well by engrafting the grape the last spring. Your correspondent, (or any other horticulturist) would confer a favor on the cultivators of the vine, if he would, through the medium of your paper, communicate the particulars of the course pursued.

Were the scions of the first or second year's growth?—At what time were the scions cut?—Was cleft or whip grafting resorted to?—Was the scion inserted near the root of the stock, or in the upper branches? A. B.

Wellesley, Mass., Aug. 20, 1828.

From the American Farmer.

Valuable practical information and hints on the culture of the Vine.

[From the author of "Cane on Fruit Trees."]

SIR,—The cultivation of the vine has become so important to the health, morals, and prosperity of our country, that I cheerfully comply with the

wishes of some respectable friends, by communicating to you the result of numerous experiments, made under my own observation, in engrafting various kinds of delicate foreign grapes and superior varieties of our domestic grapes on the more vigorous stocks of cultivated vines, or on the native vines of our fields, or transplanted native vines, removed from our hedge rows into our gardens at the moment of engrafting. The process is extremely simple, and as far as I can learn from inspection of the most approved English and French writers, and from inquiry of intelligent foreigners, is not practiced in Europe. It is performed by inserting a scion, of the usual size for planting, in the root or stock, under the surface of the earth, covering it with the earth, raised round the stock high enough to protect the scion, which is about six inches long, with two eyes only, the upper one to be even with the top of the little hillock raised around the plant. No clay or composition is necessary. The stock must be at least one inch in diameter, at one or two inches above the crown of the plant, when bared to the first roots, it must be sawed off at that point.—The stock is to be carefully split, after the loose bark is scraped off, and if necessary opened by a wedge; the scion, when firmly fixed, will be retained in its place by the pressure of the stock, after the wedge has been withdrawn or cut off. The time for engrafting is the same as for the apple, about the 1st to the 15th of April in this State. In two or three weeks the buds will sprout. One only must be permitted to grow; it must be trained to a stake, and kept pruned of lateral shoots. In a good soil it will grow ten to twelve feet the first year; after this it may be cut down to two or three eyes, or trained at greater length to a trellis, according to its strength. They invariably bear fruit the second year, and frequently will produce one or more bunches the first year. This, however, should not be permitted, except from a wish to ascertain the quality of the fruit. It is now about six years since the first attempt of an intelligent neighbor in this mode of engrafting was exhibited to me, after repeated failures of the ordinary mode of engrafting above the surface, with the aid of clay and composition. I had experienced similar failures in my own experiments, owing to the greater flow of sap in our climate. I have now growths of at least ten feet from the grafts of this spring, exhibiting a luxuriant growth of a single bunch of grapes. When the stock is sufficiently large, two scions may be inserted, and if successful, may be reduced to a single stock, or one of them may be laid down by training, about six inches under the surface, to form another vine which the second year will be nearly equal in strength and productiveness to the parent vine. From the facility with which this operation may be performed, and the short interruption it creates in the bearing, it will be easy to change any number of vines from unproductive and inferior kinds, to such as may be adapted to the soil, climate, and object of the cultivator. Foreign and tender kinds may be speedily acclimated, and an early diffusion of the finer kinds through our extensive country may be accomplished, wherever native stocks are to be found.

I believe this mode of engrafting will be new to the greater portion of your readers; it certainly is not noticed by the Abbe Rozier, by La Nouvelle Quintinye, by Miller and Forsyth, all of whom I have consulted—and a highly intelligent friend, a

native of France, possessing large estates in that country and in the United States, assured me, after careful inspection of my vines, that it was perfectly new to him, and would encourage him to introduce it in his extensive plans of improvement, to which he is devoting much of his ample means. I am respectfully and truly, your friend and obedient servant,

WM. COKE.

Burlington, July 22, 1828.

PLUMS—GRAPES.

How to make sure of having Plums—Hints for preserving Grapes.

Columbia, Pa. July 21, 1828.

If your correspondent H. B. of Dayton, Ohio, will plant all his plum trees in a lot by themselves, and either constantly keep hogs in the lot sufficient to eat all the fallen fruit, or keep the ground perfectly free from grass and weeds, tramping the ground hard, and frequently sprinkling it with salt water or brine, sweeping the fallen fruit together, burning and burying it four or five feet deep, or destroying it in any way so as to prevent the worms from entering the ground, and to have no other fruit trees growing within 300 yards from the lot containing the plums, I will venture to predict that in 4 or 6 years his plum trees will bear more uniformly than apple trees: he ought not, however, to make the experiment with two or three trees, as it will undoubtedly fail on a small scale. The curculios from the neighboring trees will be sufficient to destroy the fruit on a few trees; turkeys, ducks, and fowls in general, will assist in destroying insects, as also birds, toads, frogs, &c. and ought never be debarred the liberty of ranging in an orchard.

As the mildew is the most destructive enemy to our choice variety of foreign grapes, and as the time is at hand when it usually makes its appearance, (being in the hot moist weather of August,) I will mention a remark communicated to me, by Mr Wm. Prince, of Flushing, Long Island, New York: he states that by the use of powdered sulphur blown on the leaves and fruit they have become complete masters of mildew at Boston, and by the experiments of a skillful man here, he states his conviction that vines which are trained lower than ten feet, although subject to the mildew, will not be subject to it if trained to a greater height, on that part which rises above ten feet.

Respectfully yours,

J. B. G.

MALLEABLE CAST IRON.

A remarkable instance occurred to my knowledge of an individual fact, which might have been of the utmost use to society, but which, owing to the state of knowledge and government in Turkey, was wholly lost to the world. An Arabian, at Constantinople, had discovered the secret of casting iron, which, when it came out of the mould, was as malleable as hammeren iron; some of his fabrication was accidentally shown to Mr de Gaffron, the Prussian charge d'affaires, and Mr Franzaroli (men of mineralogical science) who were struck with the fact, and immediately instituted an enquiry for its author. This man, whose art in Christendom would have insured him a splendid fortune, had died poor and unknown, and his secret had perished with him! His utensils were found, and several pieces of his casting, all perfectly malleable. Mr Franzaroli analyzed them, and found that there was no admixture of any other metal. Mr de Gaffron has

since been made superintendent of the iron manufactory at Spandau, where he has in vain attempted to discover the process of the Arabian.

From the Milton Gazette.

A WONDERFUL DISCOVERY RECENTLY MADE IN AN OLD HORSE'S AGE.

"Tis to the pen and press we mortals owe,
All we believe, and almost all we know."

Since the age of that noble animal, the horse, after a certain period of life, (that is to say) after the marks in his *incisors* and *cuspidati* are entirely obliterated, to be able to ascertain his age, with any tolerable degree of certainty, appears to the generality of "horse age" judges, to be a subject of very much uncertainty. I now take the liberty of laying before the public through the medium of your paper, an infallible method, (subject to very few exceptions,) of ascertaining it in such a manner after a horse loses his marks, or after he arrives to the age of 9 years or over, so that any person concerned in horses, even of the meanest capacity, may not be imposed upon in a horse's age, from 9 years of age and over, more than 3 years at furthest, until the animal arrives at the age of twenty years and upwards, by just feeling the submaxillary bone, or the bone of the lower jaw.

This method I discovered, by making many anatomical observations on the skulls of dead horses and repeated dissections. In order, therefore, to elucidate the above, I must in the first place beg leave to remark—that the submaxillary bone, or the lower jaw bone of all young horses, about 4 or 5 years of age, immediately above the bifurcation, is invariably thick and very round at the bottom; the cavity of said bone being very small, contains a good deal of marrow, and generally continues in this state until the animal arrives at that period which is generally termed an "aged horse," or until the animal acquires his full size in his height or thickness; or according to sporting language, is completely furnished, with very little variation. But after this period, the cavity as aforesaid becomes larger, and more marrow is contained therein. Hence the submaxillary bone becomes thinner and sharper a little above the bifurcation.

This infallible mark may always be observed in a small degree in horses about 8 years of age; but at 9 years old it is still more perceptible. It continues growing a little thinner and sharper at the bottom, until 12 years of age. From thence until 15, it is still thinner, and about as sharp as the back of a case knife near the handle. From this period until the ages of 18, 19, 20 and upwards, it is exceedingly so; and is as sharp in many subjects as the dull edge of that instrument.

Rules.—1. Put your 3 fingers about half an inch or an inch immediately above the bifurcation, and grasp the submaxillary bone, or the lower jaw bone. If it is thick at the sides and very round indeed at the bottom, the animal is most certainly under 9 years of age.

2. If the bone is not very thick, and it is perceptibly not very round at the bottom, he is from 9 to 12 years of age, and so on. From 12 to 15 the bone is sharper at bottom and thinner at the sides, the bottom is generally as sharp as the back of a case knife; from 15 to 18, 19, 20 and upwards, without many exceptions, the bone, when divested of its integuments, is as sharp as the dull edge of that instrument.

3. Allowances must always be made between heavy, large western or wagon horses, or carriage horses, and fine blooded ones. By practising and strictly attending to the above rules, upon all description of horses, the performer in a little time, will become very accurate in the accomplishment of his desires, more especially if he attentively observes the lower jaw bone of dead horses.

BOSCAWANE.

TEA.

We are not without fears that we may fail of withdrawing from the consideration and discussion of the all important and very interesting subject of politics, a sufficient number of persons to give ear to matters and things which we conceive deserve at least to share public attention. It will we apprehend, be necessary after the election, to eat and drink and provide for our families, equally as heretofore. We cannot, therefore, see the propriety of abandoning the various modes by which these objects are to be accomplished, to take care of themselves; especially, when it is known that neither the character nor interests of parties and leading partisans will lose any thing by a little less observation. Whether we obtain an audience or not, we shall continue to discharge our duty by calling attention to subjects which we believe deserve attention.

At this time we beg to recommend to the consideration of all parties concerned, the propriety of taking measures for bringing before Congress at an early period, the subject of a reduction of the duty upon tea. This article has become a necessary of life. Its use is found to be salutary, and ought, it is believed, to be encouraged. The duty at present is high—by many deemed too much so, and such as may be feared, will lead to the article being smuggled here from Canada, and thus extensively injure our commerce. The Secretary of the Treasury in his last annual report, makes the following judicious observations upon the subject:—

The use of tea, has become so general throughout the United States, as to rank almost as a necessary of life, when to this we add that there is no rival production at home to be fostered by lessening the amount of its importation, the duty upon it may safely be regarded as too high. Upon some of the varieties of the article, it considerably exceeds one hundred per cent, and is believed to be generally above the level which a true policy points out. A moderate reduction of the duty would lead to an increased consumption of the article, to an extent that in all probability, would in the end, benefit rather than injure the revenue. Its tendency would be to enlarge our trade in exports to China, a trade of progressive value, as our cottons and other articles of home production (aside from specie) are more and more entering into it. It would cause more of the trade in teas to centre in our own ports, the present rate of duty driving our tea ships not unfrequently to seek their markets in Europe; not in the form of re-exportations, but in the direct voyage from China. It would also serve to diminish the risk of the United States ultimately, losing any portion of a trade so valuable, through the policy and regulations of other nations.—*Penn. Gazette.*

The Editor of the *Picton* (N. S.) paper, thinks that Hemp will become a staple article of export from Nova Scotia.

SOMETHING NEW.

Fly-blows are peculiar in character and remarkably fatal this season. The slightest scratch on any animal, or even a tick bite, is sufficient to induce the fly to deposit her eggs, which turn to maggots in the space of an hour, of the most hardy kind we ever heard of. Wherever these flies attack, death to the animal is the consequence unless the greatest pains is taken. Much stock has been destroyed by them, and one negro woman. A negro man was saved with the utmost difficulty. He was subject to a bleeding of the nose, and falling asleep with a speck of blood on his upper lip, the fly made her deposit which crept into his head. No matter where the worm is hid it will instantly penetrate the skin, with two strong prongs or pincers that it possesses, and make a sore for itself. It works to a great depth passing through a very small hole for about an inch, when it enlarges it into a kind of cell, and does not stop, we believe, until it reaches the entrails, unless obstructed by the bone. We heard of one of these cells that held half a pint. The usual remedies to destroy it, such as calomel, spirits of turpentine, &c. are very seldom successful. A gentleman has requested us to state, that he has succeeded by cutting open the holes and pouring in a solution of hart-horn, or aqua ammoniac, and then keeping the place covered. We had a dog afflicted with these worms, which we destroyed in the following manner. We cut open the place to the depth of an inch, (but then did not reach them) and, after scraping out all the honey-comb-looking substance, poured the hole full of a very strong decoction from elder leaves and tobacco, boiled together. In about an hour they endeavored to crawl out but died in the attempt.—The dog appeared to be entirely insensible to the operation.—*Southern paper.*

Glue.—The jewellers among the Turks who are mostly Armenians, have a curious method of ornamenting watch cases, and similar things, with diamonds and other stones, by simply gluing them on. The stone is set in silver or gold, and the lower part of the metal made flat, or to correspond with the part to which it is to be fixed; it is then warmed gently, and the glue applied, which is so very strong that the parts never separate. This glue, which may be applied to many purposes, as it will strongly join bits of glass or polished steel, is made thus: Dissolve five or six bits of mastic, as large as peas, in as much spirit of wine as will suffice to render it liquid—in another vessel dissolve as much isinglass (which has been previously soaked in water till it is swollen and soft) in French brandy or rum, as will make two ounces, by measure, of strong glue, and add two small bits of gum galbanum or ammoniacum, which must be rubbed or ground till they are dissolved; then mix the whole with a sufficient heat. Keep it in a phial, stopp'd, and when it is to be used set it in hot water.

The Dengue has been introduced at Wiscasset, by the brig Olive, from Havana. Some cases have occurred. It is compared to the Rheumatic Gout.

In a country where every mouth may be employed to blow a spark into a consuming flame, all possible care should be taken to furnish no spark

EXTRACTS

From an "Annual Address delivered before the Rhode Island Society for the encouragement of Domestic Industry." By WILLIAM E. RICHMOND.

"The most obvious and the most natural division of human labour is three-fold—the labour of *Production*; the labour of *Manufacture*, and the labour of *Distribution*. In the first are comprehended Agriculture, Fisheries, Mining, and all other labours by which crude materials are created, or reduced to the possession and use of man. In the second division is included every process by which the crude productions of nature and of art are prepared for consumption. The third division comprehends the labours bestowed in the transportation of crude and manufactured articles, as well from the producer to the manufacturer, as from the latter to the consumer. This simple view of the labours of the community, mutually dependant and depending as they are, should inculcate on our minds the unity and indivisibility of their interests. United and harmonious in their movements, they support and assist each other, while they promote the common welfare. Divided and discordant in their views and operations, their jealousies are destructive to themselves and to the commonwealth. Let it, then, be our first object, with all our powers, to promote so desirable a union of sentiment and feeling. Without the FARMER, society could not exist: Without the MANUFACTURER, it could not exist in comfort: Without the MERCHANT, it could not enjoy the conveniences and luxuries which it desires.

In praise of *Agriculture*, that parent and nurse of civilization and the arts, and in recommending her to the patronage of an enlightened people, too much cannot be said. It was observed by the most eloquent of that school of philosophers, which laid the train for the great moral explosion, which distinguished the close of the last century:—"That he who first enclosed a field, and planted it, and called it his own, laid the corner stone of the social structure, and is accountable for all the evils of society. There is more of spleen and misanthropy in this sentiment, however redeemed by the splendid style in which it is dressed, than of sound argument. It supposes as true the very thing which was to be demonstrated; namely, that society is a curse, instead of a blessing to mankind. I quote the sentiment, however, for the purpose of proving that the appropriation, enclosure and cultivation of lands are the bases of human society and civilization. Rousseau, himself, admits, that he who opposes them is a savage, and, that he who would abrogate them wishes to become a savage. It is by permanent residence and exclusive proprietorship, only, that men are encouraged to till the earth—that a surplus of food is produced for the support of handicraft trades—that population is condensed and wealth accumulated—that the other arts and sciences are cultivated—that society is protected and embellished. No friend of our race would wish to restore that *miscalled* golden age, when man, as ferocious as the tiger, lay in ambush for the weaker animals, or, in his turn, fell a prey to the more powerful ones, by which he was surrounded.

"The labours of Husbandry are among the most healthy and invigorating employments of man. "God made the country," says the proverb. Rural pursuits, more than any other, pre-

serve the simplicity of manners and innocence of life which constitute the charm and promote the happiness of society. It is impossible to conceive a more attractive picture of life than that presented by a well-settled rural neighbourhood, where the lands are fertile and well cultivated; the buildings, fences and roads in good repair; the men industrious and temperate; the women good house-wives, faithful companions and tender mothers; the children well schooled, obedient and mannerly; the clergyman a teacher by example, as well as by precept; the physician and lawyer, skilled in their professions, supported by their farms, and, emphatically, the guardians of the health and property of their neighbours; the school-master learned, faithful, and beloved by his pupils. In the untroubled bosom of such a retreat the votary of politics or pleasure might easily bid adieu to the storms and frivolities of the world, "nor cast one longing, lingering look behind." How many such little communities may be found in this our country, where exist the elements of that power which constitutes, at once, its safety and renown! Farmers, your lot is truly enviable. You cannot be unmindful of its advantages. On you, as the most numerous and virtuous, as well as the most permanent and independent class of this great nation, depend its present welfare and its future hopes. I will not presume to instruct you in any branch of your own profession; but permit me to impress upon you its dignity and importance—to incite you, to prefer it to all others, for the settlement of your sons in life: and to qualify them, by a proper education, to fill it, with success and respectability. It is an erroneous opinion, that none but *professional* men, so called, should be liberally educated. Every *honest* calling is more or less profitable, and, consequently, respectable, in proportion to the intelligence, generally possessed by those who follow it. An acquaintance with belles lettres and the moral sciences enables the farmer to participate, with honour and usefulness, in the politics of his country. An acquaintance with the *physical* sciences explains to him the principles of his profession, and qualifies him to assist the operations of nature with the suggestions of an enlightened philosophy. Educate your children, then. If you cannot spare your sons to go to college, encourage well-educated collegians to settle among you, as teachers.—Wingling the instructions of such men with their ordinary employments, your sons will grow up in the daily application of theory to practice. They will unite to a thorough and scientific knowledge of their profession, those acquisitions in general science, which qualify men to act their parts, as members of the body politic—as legislators and as statesmen."

Folding sheep.—Cotting, or folding of sheep, is a practice more or less extensively followed with particular breeds and in particular districts, but now generally on the decline. It was formerly thought to be indispensibly necessary to the success of the farmer in different districts; but of late a different opinion has prevailed, except in particular cases, and it is considered as merely enriching one field at the expense of another. The object is to enrich the arable land; but as this is done at the expense of the pasture, it is truly, as Bakewell expresses it, "robbing Peter to pay Paul."

VARIOUS KINDS OF INTEMPERANCE.

Doctor D. M. Reese, a respectable physician of New-York, in a work recently published, considers intemperance as the prolific mother of human miseries, and is of opinion that if mankind were universally temperate in all respects, casualty and old age would be the chief passports to the grave. He notices several species of Intemperance:—Intemperance in Drinking, Intemperate Eating, Intemperate Sleeping, Intemperance in Clothing, Intemperate Labour, Depraved Appetites, &c.

Intemperance in Clothing.—Dr. R. points out the ill effects on health of tight lacing, and remarks that almost every professional man has witnessed the fatal results of this abomination. He dissected the bodies of two young females who had died of disease caused by tight lacing, and found "the adhesion of parts and the derangement of structure truly frightful." He adds, "the ingenuity of the ladies, perhaps, could not be better exerted than in contriving some method of preventing such havoc as is usually occasioned among them from tight lacing and thin dressing."

Eating opium and snuff.—Dr. R. states as a fact well known to the faculty, that hundreds of females in our large cities are in the daily use of taking opium. "This is neither more nor less than a fashionable way of getting drunk, and ought to be frowned upon by every husband and father."

Dr. R. says he has known two instances of death from *eating snuff*, "a habit which is perhaps increasing among the ladies of our country with a rapidity only equalled by the ravages of ardent spirits, and which is no less ruinous to health and destructive to life." "This practice has its origin in using the Scotch snuff as a *tooth powder*,—a fondness is soon acquired for it, and hundreds among us, especially among our females, *get drunk* upon it every day of their lives." The effects are paleness of countenance, torpor of body, stupor of mind, diseases of the stomach, lungs, &c.

Drinking malt liquors to excess.—In Great Britain, diseases are increased in number and fatality by the large quantity of malt liquor drank in their community. Sudden deaths are frequent among those who drink habitually and excessively of these liquors.

Cold water.—Dr. R. says "that death seldom occurs from drinking water, except in constitutions previously impaired by some of the other species of intemperance."

Drinking ardent spirits.—This is the worst kind of intemperance, and in criminality, and the magnificence of its evils, outweighs all the rest.—*Hampshire Gazette.*

A gentleman in the Strand, London, has just adopted a mode of generating gas over a common kitchen fire, and of purifying it so well by a new process, which is yet a secret, that it may not only be introduced with safety into houses, but without causing any bad smell. The novelty of the invention consists principally in the adaptation of a retort to a common kitchen fire.

Chesnut trees.—It is stated in Philips' History of Fruits, that the great chesnut tree near Mount Etna, is perhaps one of the most extraordinary trees in the old world. It is called "the chesnut tree of a hundred horses," from the following traditional tale: Jean of Arragon, when she visit-

ed Mount Etna, was attended by her principal nobility, when a heavy shower obliged them to take refuge under this tree; the immense branches of which sheltered the whole party. According to the account given of it by Mr. Howel, this chestnut tree is one hundred and sixty feet in circumference—and although quite hollow within, the verdure of the branches is not affected; for this species of tree, (like the willow and some others,) depends upon its bark for subsistence. The cavity of this enormous tree is so extensive, that a house has been built in it; and the inhabitants have an oven therein, where they dry nuts, chestnuts, almonds, &c. of which they make conserves; but as these thoughtless people often get fuel from the tree that shelters them, it is feared that this natural curiosity will be destroyed by those whom it protects.

FATTENING SWINE.

“According to the opinion of the Rev. Mr. Elliot, the best time in the year to shut up hogs to fatten them, is the month of August. I rather prefer the month of September, when it may be depended on, that they will not suffer at all by the heat in their confinement; and there will be time enough to make them fat, before the weather becomes to be extremely cold.

He that attempts to fatten his hogs in winter will be a loser; for it has been found by long experience, that they do not gain in their flesh near so fast in a frosty, as in a temperate season. I therefore take care to get them fit for the knife by the beginning or middle of December, and I should choose to kill them still earlier, were it not for the advantage of keeping the lean part of the pork for some time without salting; as it most commonly may be done by exposing it to frost, in the coolest part of a house.

But a very important question is, what food and management is best in fattening swine? Peas answer well, when the price of them is low. But I am constrained to give the preference to Indian corn. Let them be fed in September with green ears from the field. There is nothing they will devour more greedily than this corn, and even the cobs with it.

In Indian harvest, the unripe ears should be picked out, and given to the hogs that are fattening, without delay; or as fast as they can eat them; for it will do them four times as much good in this state, as it will after it is dried, it being difficult to dry it without its turning mouldy or rotten; so that they will scarcely eat any of it in this state, unless they be kept shorter of food than fattening hogs should be.

After the unripe corn is used, that which is ripened must be given them.

If it be thought most convenient to feed them with corn of the preceding year, it should not be given them without soaking, or boiling, or grinding it into meal. For they will not perfectly digest much of the hard kernels; it being often too hard for their teeth. It has been thought by good judges, that the corn will be at least a sixth part more advantage to the swine for soaking it in water. But there is if I mistake not, still more advantage in grinding it. What new corn is given them, may be in ears, as it is not hardened enough for grinding. I know of nothing that will fatten hogs faster than a dough of meal and water. But as this is expensive food, the dough may be mixed with boiled potatoes, or boiled carrots.—

They eat these mixtures as well as dough by itself; and it appears to make no material difference in their fattening. In this mixture, barley meal will answer instead of Indian; which should be attended to in our more northern parts, where two bushels of barley may be as easily raised, as one of Indian corn. Both kinds of meal I have found to be a good mixture with boiled potatoes; but it should by all means be a little salted to give it a good relish.

While hogs are fattening, little or none of the wash from the kitchen should be given them.— Their drink should be fair water, which they relish better than any other drink, and of which they will drink a good deal, when they are fed only on corn, or stiff dough.

To prevent measles and other disorders in hogs, while they are fattening, and to increase their health and appetite, a dose or two of brimstone, or antimony, given them in their dough, is useful, and should not be neglected.

Some change of food may be advisable, in every stage of their existence, as it always seems to increase their appetite. But while they are fattening, laxative food in general should be avoided, as these animals are seldom known to suffer by costiveness, especially when they are full fed, but often from the contrary disorder. If they chance to be costive, a little rye will help them.

In feeding, steady care should be taken that not one meal should be missed, nor mistimed, and their water should never be forgotten. They should always have as much food as they will eat up clean; but never more than that quantity, lest they defile it and it be wasted. A little at a time and often, is a good rule.

If their skins be scurfy, or inclining to manginess, a little oil poured upon their backs, will cause it to come off. And some say a small mess of rye now and then, as a change in their food, is good against these and other disorders.

If the issues in the fore legs should chance to get stopped, every attempt to fatten them will be in vain. These, therefore, should be watched; and if found to be stopped, they should be rubbed open with a corn cob.

Rubbing and currying their hides very frequently, is of advantage to keep up perspiration. It is grateful to the animals, as well as conducive to their health and growth. A proper scrubbing post in the middle of their pen will not be amiss. And during the whole time of their fattening, they should have plenty of litter. They will lie the more dry and warm, and it will be more than paid for, by the increase of good manure.

When hogs are killed, a single one should not be left to live alone in a pen. He will be apt to pine too much after his former companions. And in cold weather he will suffer for want of lodging so warm as he has been accustomed to do.

The fat of pork should be plentifully salted with the best and strongest clean salt. It will take three pecks for a barrel. The pork should be kept continually under pickle; for if it be exposed ever so little to the air, it will become rusty and unpalatable.

Boiled or steamed clover hay will serve to keep hogs during winter, but the addition of potatoes or carrots, boiled or steamed with the hay will be an improvement.

Mr. Young directs soiling swine in a yard in preference to feeding them on clover in the field during summer. But Judge Peters, of Pennsylv-

ania, says, “In summer my hogs chiefly run on clover. Swine feeding on clover in the fields will thrive wonderfully; when those (confined or not) fed on cut clover will fall away.” The same gentleman asserts that hogs, while fattening, should constantly have some dry rotten wood, kept in the pen, which they will eat occasionally, and it proves very beneficial to them. It is also declared, as well by that gentleman as other writers, that food when soured by a proper degree of fermentation is much the best for fattening swine, and that one gallon of sour wash will go as far as two of sweet for that purpose. Mr. Young says, that the best method of feeding all kinds of grain to hogs is to grind it to meal, and mix it with water in cisterns for that purpose, at the rate of five bushels of meal to a hundred gallons of water.—*Dane.*

BATHING.

It is a common notion that bathing is of importance to the health only in summer. But this is a great mistake. It may, indeed be of more importance for the single purpose of cleanliness, for dust and perspiration, to require more frequent ablutions, in hot weather than in cold. But this is far from being the most important use of bathing.— To clear the pores of the skin, to soften the contractions produced by cold, to open the small vessels and tubes that are designed to carry the circulation to the very surface, are the great and salutary effects of bathing. In producing these effects, we perceive at once how bathing promotes health, especially at the season of the year, when we are exposed to autumnal fevers, and how it prepares the body for the rigours of winter. It is, also, obvious that the bath should be hot; not merely tepid or luke-warm, but considerably warmer than the body. Heat is a very subtle fluid and like all other fluids seeks a level, or an equilibrium. If you go into a bath somewhat colder than your body, your body loses heat; it imparts its warmth to the water till both are at the same temperature. The chill which is felt on coming from such a bath is evidence of this fact, and shows that the system has been injured rather than benefitted. But if the bath be warmer than the body, the balance of heat is produced by the water's imparting heat to the body, and the operation of it is to give a grateful impulse to the action of the system, and send the blood briskly to the surface and the extremities, opening the channels, clearing away obstructions, and diffusing a glow over the body, and a quiet joy over the mind, which are the unimpeachable witnesses of health, and the perception of which is luxury.

Troy (N. Y.) Register.

Acorns.—These are sometimes given to poultry and would be found an advantageous food for fowls, were they dried and ground into meal.—Acorns can be preserved in a state fit for vegetation for a whole year by enveloping them in bees wax. Other seeds may be conveyed from distant countries by the same means. Miller advises to plant acorns as soon as they are ripe in October, which will come up in the following April; because, if they are attempted to be kept, they will sprout, though spread thin.

Mr. Benjamin Peacock, of Bristol, killed a calf on the 22d of July, of five weeks and four days old, which weighed 162 lbs.—and yielded 17½ lbs. of rough tallow.

CANADIAN AGRICULTURAL REPORT,
FOR JULY.

Haymaking, which is generally the most pleasant of all rural affairs, has, during the past month, been the most unpropitious ever remembered by the oldest farmer in all the country. Hay making began as early as the 5th of the month, at which time the weather broke, so that we had hardly two dry days together at a time, and there is scarcely a tenth part of the hay housed, but what is more or less damaged. Owing to the excessively deluged state of the lands, many fields of potatoes are greatly injured, as the rain fell in such abundance, that the ditches could not carry it off as fast as it fell; the consequence is, that grain of all kinds, on flat lands, stood up to the middle in water for several hours together. Wheat is much rusted where strong, so that the quality will not be so good as expected at the middle of last month. Oats and Barley are ripening, but are knocked down in a shocking state; many fields are lying as flat as if they had been passed over by a roller. Stock all in good condition, but the produce of dairies is very low. Fruit has suffered much from the heavy rains, as well as from the high winds, and will not be so abundant as was expected. In fact, we have seldom known a time in which farmers have suffered more, or in which their minds have been kept in such a state of anxiety as during the past month.

LONDON IN OLDEN TIMES.

Sir William Davenant thus describes London, as it was before the great fire.

"Sure your ancestors contrived your narrow streets in the days of wheelbarrows, before those greater engines *carts*, were invented. O, the goodly landscape of Old fish-street! which had it not had the ill-luck to be crooked, was narrow enough to have been your founders' perspective: and where the garrets (perhaps not for want of architecture, but *through abundance of unity*) are so made, that opposite neighbors may shake hands without stirring from home. Then for uniformity of building—yours looks as if they were raised in a general insurrection. Here stands one that aims to a *palace*, and next to it another that professes to be a *hovel*. Here a giant, there a dwarf, here slender, there broad, and all most admirably different in their faces, as well as in their height and bulk. As for your ceilings, they are so low, that I presume your ancestors were very mannerly, and stood bare to their wives, for I cannot discern how they could wear their high-crowned hats.

"I now leave your houses, and am passing through your streets; but not in a coach, for they are uneasily hung, and so narrow, that I took them for a sedan upon wheels; nor is it safer for a stranger to use them till the quarrel be decided, whether six of your nobles, sitting together, shall stop and give place to as many bottles of beer.—Your city is the only metropolis of Europe, where there is a wonderful dignity belonging to carts."

TO RENDER CUCUMBERS WHOLESOME.

Slice cucumbers into a basin of cold spring water, and it will not only make them eat by far more crisp and fine, but will also render them much more wholesome, and effectually prevent their rising in the stomach. The water will completely extract and take away the pernicious juice of the cucumber, which is the principal cause of their so often disagreeing with the stomach.

Method of roasting eels.—Having skinned and washed some of the finest large eels, cut them in three, four, or five pieces, according to their lengths. Make a seasoning of grated nutmeg, pepper, and salt, with a little thyme, sage, and lemon peel, all well beaten and mixed plentifully with crumbs of bread. Strew this well on the eels, stick them across on skewers, tie the skewers to the spit, baste them continually, and let them roast till they begin to crack and appear white at the bone. When taken up, send them to the table with melted butter and lemon juice, which will make the best sauce for them. They may be fried or boiled thus seasoned, with very good effect.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 22, 1828.

EXTIRPATING CHICORY, or SUCCORY.

A correspondent wishes us to "publish the best mode of exterminating succory which prevails a great deal this season."

Chicory has been highly recommended by agricultural writers, both in Europe and America, as a valuable plant for cultivation. But every plant which grows where it is not wanted, is, in a relative sense of the word, a weed.

Weeds may be divided into annuals, biennials, and perennials, or weeds which will endure one, two, or more years without being renewed from the seed. All annuals and biennials are effectually destroyed by cutting or mowing the plant, at any point below that from which the seed leaves originated, in proper season to prevent the seeds from becoming so far matured that they will grow when lodged in the soil. With regard to perennial weeds, such as couch-grass, charlock, colts-foot, white-weed, and we believe chicory, their destruction can only be effected by repeated ploughing, harrowing, and extracting the roots from the soil, and either burning, or exposing them in such a manner as to ensure their destruction. We have, however, but little personal acquaintance with this chicory: either in its capacity of an useful plant or a pernicious weed; but should be much obliged to any friend or correspondent for information on the subject.

SILK.

Extract of a letter to the Editor of the New England Farmer, dated Rochester, N. Y. Aug. 12, 1828.

Last year I commenced on a small scale the rearing of the silk worm, and have produced some beautiful specimens of silk: they do well in this country. I have now a nursery of about 2000 white mulberry trees. From all the information I can obtain, either by observation or otherwise I believe that this section of country will prove fully equal to any other, (either Italy or France) for the raising of silk worms. The pamphlet on this subject, published by our government last winter, should be in the hands of every farmer and friend to the country, it is plain and practical. The grape vine also flourishes here and promises well—we have a soil peculiarly adapted to it.

COW TEAM.

An intelligent gentleman at Geneva, Switzerland, proposes to substitute the labor of cows for that of oxen and horses; and he maintains that it would increase both the quantity of milk and the

calves, and that one cow will do as much work as an ox of equal size. He however, allows that the limitation of milk and labor may be one fourth, but still eight working cows would perform the labor of six oxen, and at the same time give as much milk as six cows that did not work—which would, in a year, amount to a considerable saving to the poor farmer. An elaborate article on this subject will be found in the New England Farmer, vol. iii. page 326.

FRENCH MODE OF TAKING HONEY.

The following easy method of taking honey, without destroying the bees, is the method generally adopted throughout France. In the dusk of the evening, when the bees are quietly lodged, approach the hive and turn it very gently over; having steadily placed it in a small pit, previously dug to receive it, with its bottom uppermost, cover it with a clean new hive, which has been previously prepared, with two small sticks stuck across its middle, and rubbed with some aromatic herbs. Having carefully adjusted the mouth of each hive with the other, so that no aperture remains between them, take a small stick, and beat gently round the sides of the lower hive for ten minutes or a quarter of an hour, in which time the bees will leave their cells in the lower hive, ascend and adhere to the upper one. Then gently lift the new hive with its tenants, and place it on the stand from whence the other hive was taken. This should be some time in the week preceding midsummer day, that the bees may have time before the summer flowers are faded, to lay in a new stock of honey, which they will not fail to do, for their subsistence through the winter.—As many as have the humanity and good sense to adopt this practice, will find their reward in an increase of their stock and their valuable property.

TRANSFUSION.

Some successful experiments are now making, by a gentleman in Herefordshire, with the view of preserving fruit trees from decay, by planting young trees in the vicinity, and transfusing the sap of the young plants through the bark of the decaying tree, and thus uniting the circulation of both.

The Editor of the Wilmington (N. C.) Reporter, states that he has seen a water melon, a present to a gentleman of that town, which weighed 41½ lbs. measuring in circumference one way 3 feet 4 inches, and the other 3 feet 7 inches.

GARDENING.

The management of a garden, summarily speaking, consists in attention and application, the first should be of that useful and provident kind, as not only to do well in the present, but for the future; and the latter should be of that diligent nature as willingly "never to defer that till tomorrow which may be done today." Procrastination is of serious consequence to gardening; and neglect of times and seasons will be fruitful of disappointment and complaint. It will often happen, indeed, that a gardener cannot do what he would; but if he does not do what he can, he will be most justly blamed, and perhaps censured by none more than by himself.

Weeding in time is a material thing in culture, and stirring the ground about plants, as also earthing up where necessary, must be attended to. Breaking the surface will keep the soil in

health; for when it lies in a hard or bound state, enriching showers run off, and the salutary air cannot enter. Weeds exhaust the strength of the ground, and if they are suffered to seed and sow themselves, may be truly called GARDEN SINS. The hand and hoe are instruments for the purpose. Digging where the spade can go, between the rows of plants, is a good method of destroying weeds; and as it cuts off the straggling fibres of the roots, they strike afresh in numerous new shoots, and are thus strengthened. Deep hoeing is a good practice, as it gives a degree of fertility to the earth.

MANURE.

Manure is the great sinew of agriculture, as money is of war: and the making the best of every advantage or opportunity for increasing the quantity of it, is one of the most prominent traits in the character of a GOOD FARMER.

Amongst the stock of poultry, in the farm-yard of — Robinson, Esq. of Benningholme Grange, near Swine, is a hen of a most aspiring character. Last year, preparatory to incubation, she was accustomed to ascend a lofty tree, and, having laid a number of eggs in an old crow's nest, succeeded in producing a young brood in that elevated station. The chickens were got down by means of a ladder, and reared in safety. In the present summer the same hen climbed up another tree and laid her eggs (also in a crow's nest) in a situation wholly inaccessible. She hatched her offspring; but, as it was impossible to rear a ladder to the height, the chickens, on attempting to quit the nest, fell to the ground and were all killed.—*Hall Packet.*

R. Rush, Esq. Secretary of the Treasury, has advertised that the Revolutionary Claimants will be paid their half-yearly pensions, agreeably to the late act of Congress, on and after the 3d of September next.

Prodigious.—We understand that the steam-boat North America left New York on Saturday for this city, with 500 passengers; and after all intermediate stoppages and changes, actually landed 380 on her arrival at this place.—*Albany Chr.*

Two signs were once opposite each other, at Philadelphia—thus inscribed—"James Sholl" and "Jonathan Fell."

The work shops in the State Prison were lately burnt. The fire was discovered about the time the convicts were returning to their cells and is supposed to have been communicated by some of them.

Fire.—A small wooden box filled with saw dust in an office near Harper's Ferry, where no spark had been used for many days, was found to have taken fire near the bottom, the saw dust in the upper part was untouched.

Blackstone Canal.—The weather during a few weeks past has been favorable for the work of the Canal. It is confidently expected that the whole will be rendered navigable by the day fixed for the Annual Agricultural Festival.

Cure for the Dysentery.—It is probably not so generally known as it should be, that *boiled milk*, thickened with flour, and taken in the first stages of dysentery, is, in all common cases, an invaluable remedy. Boiled milk without flour is too harsh.

Soundness of the lungs.—Dr. Lyons, of Edinburgh, proposes an ingenious and practical test for trying the soundness of the lungs. The patient is directed to draw in a full breath, and then begin to count as far as he can, slowly and audibly, without again drawing his breath. The number of seconds he can continue counting is then to be carefully noted. In confirmed consumption, the time does not exceed eight, and is often less than six seconds. In pleurisy and pneumonia it ranges from nine to fourteen seconds. But when the lungs are sound, the time will range as high as from twenty to thirty-five seconds.

It is delightful to see savages becoming civilized; but it is deeply disgraceful and afflicting to see civilized persons becoming savage.

Several Communications are on hand.

Seeds for Fall Sowing.

For sale at the New England Farmer Seed Store, a fresh supply of various Grass Seeds—also a great variety of Vegetable seeds for fall sowing, viz. White Potatoes, Strasburg do. Silver-skin do. Prickly Spinach and Dutch Cole for early greens—various kinds of lettuce, carrot, cucumber, cabbages, &c.—black, Spanish or winter radish, &c. all warranted fresh.

Orchard Grass Seed—growth of 1823.

Just received at the New England Farmer Seed Store, No. 1 North Market Street, 20 bushels of prime Orchard Grass Seed, raised, this season, with the greatest care, by John Prince, Esq.—warranted to be equal in purity to any ever offered for sale in New England.

A supply of pure Gilman Wheat, raised by Payson Williams and Mr. Winchester, is daily expected.

Wild Geese.

For sale, five pairs of Wild Geese, two pairs three years old, and three of the subscriber. BENJ. J. PHILLIPS.
Lynn, August 16, 1823.

For Sale,

A Pull Cal five weeks old of the Short Horn breed, from the best Imported Stock, both Sire and Dam, well known and highly approved. Apply at this Office for price and particulars of pedigree. *Aug. 20, 1823.*

Farmer Wanted.

An intelligent, capable man is wanted to take charge of a Farm a few miles from the city. He must be able to produce undoubted references, as to his knowledge of the business, habits of industry, &c. With one having the requisite qualifications an arrangement might be made for taking the farm on shares.

FOR SALE,

An excellent Mare with her Colt, by the celebrated Horse Bell-founder. Also, a Pull, two years old, by Denton—perfectly kind and good tempered. Likewise, one fell blood Merino Ram, one Ewe, and one Lamb. Apply at the office of the N. E. Farmer. *3d Aug. 3*

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D." Boston through the post-office. *6th Aug. 1*

Out Meal, Out Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Out Meal, fine bolted Out Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few canisters of fine Out Flour, neatly packed, at 50 cts. per canister.

Gunpowder, &c.

De Pont's Gun Powder, at 23 to 50 cts. per pound—Shot—BaEs—Flints and Percussion Caps
Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the *Dyport Powder Store*, No. 65 Broad Street—By E. COPELAND, Jr.
The De Pont sold as above, is warranted first quality—and is marked "E. Copeland, Jr. Boston," on the head of the cask. *March 11*

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturalists in the vicinity of Boston and New York, is just published by J. B. Russell, Proprietor of the New England Farmer. The articles are arranged alphabetically, and comprise the most useful VEGETABLES and FRUITS which can be conveniently and economically cultivated in the climate of New England and the Middle States; as well as a Treatise on FLOWERS, and on LANDSCAPE and PICTURESQUE GARDENS, on the general management of the Fruit WORM, and the manufacture of SILK, and a Treatise on the culture of GRAPE VINES and the STRAWBERRY. The article on Fruit Trees contains an enumeration and description of all the Apples, Peaches, Cherries, Plums, Nectarines, Apricots, &c. &c. that can be raised to the most advantage, and their relative hardiness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written.

A list of the contents of the work will be found in the New England Farmer for August 1.

Besides a faithful investigation of all the standard works on Gardening and Horticulture recently published in England, and the Transactions of the London Horticultural Society, the New American Gardener is enriched by articles or extracts from the writings of the following American gentlemen:

J. Armstrong, Jesse Budd, L. Bartlett, L. W. Briggs, Joseph Cooper, Wm. Cox, J. G. Collins, T. Coulter, S. Deane, E. H. Derby, H. A. S. Dearborn, Doct. Brown, J. H. C. J. Ellis, O. Fiske, Doct. Green, J. M. Gougar, R. Howard, T. W. Harris, T. Hubbard, L. McKean, J. Kenrick, John Lowell, H. Little, A. Landrum, J. Mease, E. McMahon, F. A. Menox, W. Moody, E. Preble, J. H. Powell, L. Peterson, S. W. Pomroy, W. D. Peck, T. Pickering, E. Perley, A. Paine, J. W. Proctor, S. C. Perkins, Professor Say, Doct. J. Spofford, Josiah Quincy, James Thatcher, R. Treat, I. Tuck, R. Tinsley, W. Wilson, M. Webster, J. F. Wiegater, J. W. Watkins, Benjamin Wheeler.

Price \$1.25—Six copies for \$6.00.

MISCELLANIES.

From the Berkshire American.

MILITIA SYSTEM.

Our Militia System, (says the accomplished Editor) is every day treated with less and less respect. It is attacked in the pulpit—lashed by the press—scouted by wags—hated by farmers—execrated by the mechanics, and treated with redness even by the soldiers themselves. In short, it finds little quarter except with idle boys, romping girls, and members of the Legislature. Not long ago the following conversation took place between Colonel Canteecuzena, a member of the Legislature and Corporal Calabash—both officers of the Massachusetts militia.

Col.—Well, friend Calabash, you've got a rising post.

Corp.—Why, yes sir—rather on the rise; and as the militia system is falling, I may soon get to the top.

Col.—Get to the top!—what do you mean you ungraceless reprobate? You don't calculate, to mount over the heads of colonels, and majors, and the like, and get to the top without passing thro' the regular gradations of office.

Corp.—I had no idea of mounting at all: I was only thinking of waiting till the system come down to me.

Col.—Eh?—Then you will wait one while, by gorry—and you may as well hang up your whistle as to think of rising like a Ponce, on the ashes of our glorious and unparalysed militia system.

Corp.—It is not altogether unparalysed, colonel; on the contrary, it has met with some pretty smart shocks, that have benumbed and crippled it most severely. It is with great difficulty it can make a shift to stand, by the help of the Legislature.

Col.—Harkee, corporal Calabash, I belong to that honorable body, and I advise you not to cast none of your slurs and back-handed illusions upon the corroborated wisdom of the State, or possibly you may be brought up for attempt of court.

Corp.—I have been brought up by an attempt of court too often, and compelled to march half a day with a gun on my shoulder, a mere spectacle for boys—and all to gratify your Legislative wisdom, which is more lame than justice herself, and comes limping along a mile behind the sense of the age.

Col.—The age has no sense—the people are start mad—as mad as a March mare. We should have fine times, indeed, if our laws didn't compel the poor people to protect the property of the rich. But I cannot believe the people are in earnest about overthrowing our glorious and matchless militia system.

Corp.—Never boast of its being matchless, colonel, for public opinion is preparing a match for it that will be apt to blow it sky high, sir.

Col.—Is it so near its end then, Calabash?

Corp.—It is even so. It has been trembling for some years, and now only survives to excite ridicule and reproach.

Col.—Well, if it must go, EB—gl— for it till all is blue. Ay, sir, I'll stick to it, as who I—st, as Lonsidas did with his three hundred Spaniards at the Straits of Thermopylae;—I'll never, never give up the ship, by gorry.

Corp.—Pray let me know, colonel, to see a man of your make.

Col.—Ay, sir—I hope I am not wanting in the red military coat. I am as good as to find a pro-

misning young officer like you, a corporal, enlisted against the militia system.

Corp.—I am a promising fellow, it is true; and as a proof of it, I promise you on the word of a corporal, that I have very little ambition for the honor and glory of a militia officer. So far from wishing to mount over your head, as you just now mentioned, that I pray heaven your epaulettes may cling to your shoulders, and your sword to your side, as long as the State continues in petticoats, and is pleased with mere military play-things.

Col.—Though I spoke about sticking to the system, I had no idea of holding on to my commission forever. No, I calculate soon to resign my epaulettes and other bags of distinction, having already spent a good thousand dollars in supporting them honorably.

Corp.—Indeed! It is vastly tempting for a corporal to persevere in the path of promotion!—to get honor enough to come to a thousand dollars! But I take it militia honors will be less expensive before many years. The people are wide awake, and fully resolved to get rid of so useless a burden.

Col.—How do they calculate to get rid of it, Mr. Corporal?

Corp.—By getting the law repealed.

Col.—Exactly so. But harkee, Calabash, that is not so easy a matter as some people imagine. I belong to the Legislature, and while I have a seat there, I'll do my best to keep up the old militia system.

Corp.—Unequal and burdensome as it is!

Col.—I don't care a snap for that; I've spent a thousand dollars in its support, and—

Corp.—Never benefited the country a thousand mills—I beg pardon for interrupting you, colonel.

Col.—Whether I've benefited the country or not, I leave to my constituents to judge. But one thing I know, I've spent my money, and I've determined others shall spend their'n in the same way.

Corp.—A noble principle that!—and worthy of a Legislator!!

Col.—Worthy, or unworthy, sir, it is the principle of a majority of the Legislature—of that honorable body, who are two thirds of them past and present militia officers, such as generals, colonels, majors, &c. all of whom have spent a great deal of money in brushing up their regimentals, and polishing their weepers, and wetting their commissions, and wish to strut about like so many buffoons, for idle boys to stare at, and never will consent that others shall come off with a lighter burden than they.

Corp.—Well, if the Legislature is composed of such men, it is time they had leave to stay at home, and the noncommissioned officers and privates will be apt to reserve the right of command, and say to them, at the ballot boxes—"to the right about face! March! You're dismissed!"

Loss of brains.—The present Duke of Manchester met with an accident, by which a piece of his skull was kicked away by a horse, with a portion of the brain also; and yet his Grace has made a very excellent Governor of a colony notwithstanding. It is now well known, that the outer, or as it is called, the *cortical* part of the brain, is entirely devoid of feeling when in a natural and healthy state; and that any portion of it may be lost by accident, (as in this instance) or by disease, without any interference with the intellect of the individual. It is only when the medullary, or in-

nermost portion of the brain, is compressed or injured, that life and intellect are affected.

Except thou desire to hasten thine end, take this for a general rule, that thou never add any artificial heat to thy body by wine or spice, until thou find that time hath decayed thy natural heat, and the sooner thou beginnest to help Nature, the sooner she will forsake thee, and leave thee altogether to Art.—*Sir. W. Raleigh.*

Vegetable Resuscitation.—A very old mulberry tree was shattered in pieces by a storm of wind in 1790; afterwards, an elder tree, which grew, without doubt, from berries that had fallen into the heart of the old mulberry trunk, usurped its place: this elder tree died in 1826, and then—36 years after the destruction of their parent stem—about a dozen of mulberry shoots started forth to the light of day.

Many people say ripe fruit is always wholesome. But it is injurious to eat to excess even of good; beside, proportions of different kinds of food are required. Fruit has very different properties, whatever those properties are, good or bad, they are most powerful when the fruit is ripe.

Numerous Swiss emigrants remained at Havre when the *Olympian* sailed, waiting a passage to the United States. All the American vessels there could have a full compliment. We are informed some months since, that from eight to ten thousand were arranging to emigrate, principally from the Canton of Bern.

Bitter Almonds.—These were considered by the ancients as of use to alleviate the evils of drunkenness. Plutarch relates that Drusus' physician, (who was a great drinker) took at every cup five bitter almonds, to allay the heat and fumes of the wine. Bitter almonds are held aperient, detersive and diuretic; they are therefore recommended in obstructions of the liver, spleen, &c. Pliny states, that a decoction of the roots of the bitter almond-tree supplies the skin, prevents wrinkles, and gives a fresh, cheerful color to the countenance; and that bitter almonds cause sleep, and create appetite. They were considered as a cure for chilblains, as well as the bite of a mad dog.

DISTRICT OF MASSACHUSETTS to wit:

District Clerk's Office.

Be it remembered, That on the eighteenth day of July, A. D. 1828, in the fifty-third year of the Independence of the United States of America, J. B. Russell, of the said district, has deposited in this office the title of a book, the right whereof he claims as proprietor, in the words following, to wit:

"The New American Gardener; containing practical Directions on the Culture of Fruits and Vegetables; including Landscape and Ornamental Gardening, Grape Vines, Silk, Strawberries, &c. &c. By Thomas G. Fessenden, Editor of the New England Farmer."

"God Almighty first planted a Garden; and indeed it is the purest of human pleasures— it is the greatest refreshment to the spirits of man; without which buildings and palaces are but gross hardly-works—Bacon's Essays."

In conformity to the act of Congress of the United States, entitled, "An Act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies during the times therein mentioned;" and also to an act, entitled, "An Act supplementary to an act, entitled, An Act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies during the times therein mentioned; and extending the benefits thereof to the arts of designing, engraving, and etching historical and other prints." JNO. W. DAVIS, Clerk of the District of Massachusetts.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

FOR THE NEW ENGLAND FARMER.

HAY—FODDER.

MR FESSENDEN—As the mowing season draws to a close, it becomes a matter of regret, that the result is likely to disappoint the early expectations of a great abundance. It is a fact, that in general the barns are filled, and that many small stacks make their appearance in the yards, but the *quality* ought to be considered as well as the *quantity*; and there is no doubt but a considerable proportion of the English hay got in this season, has been greatly injured in the making, by the continual showers, and that there is but a small portion of the general crop, which can be esteemed of a first rate quality; even the best is inferior to the hay raised in common seasons; having grown on a soil continually soaked with rain, it is less substantial and nutritious, and will not go so far in feeding either cattle or horses. In regard to the produce of the meadows, it is *very materially* injured; even the most favored lots have suffered greatly from a superabundance of water, which has checked the growth of the better grasses, and encouraged that of the coarse, broad grass, which when dried is hardly fit for any purpose but that of a poor litter. The lower meadows have been so long under water, that the best grasses have perished, and where in good seasons the eye is delighted to contemplate a thick and rich mixture of pipes, red, blue and cel, and other valuable grasses, nothing at present is seen but a dreary waste, the swarth being laid down and in a state of decay. It is probable that the most of it will not be thought worthy of the labour of mowing, poling and bringing to the barn.

All these matters duly taken into consideration, the hay produce of this year, will be found, I apprehend, not to exceed an average crop; yet the impression of a great abundance is gone abroad, and has brought down the market to an unaccountable state of depression. If we consider that the exuberant vegetation of this season, has been owing to an unusual quantity of rain, aided by heat, and by frequent thunder, (electricity), we must acknowledge it to be the result of powerful stimulants, which after their effect is over, will leave the swarth in an exhausted state, threatening great sterility, the first coming season of a dry, or otherwise unfavorable nature. The reflecting, experienced farmer, will see, therefore, that although the precise time is hidden, that "*the lean time*" are coming; and he will prepare accordingly. Under that impression it would seem, that, although much degraded, the produce of all meadows unmowed yet, may be, it ought to be, gathered and secured. A good salting will give some relish to poor fodder. It would assist to save the English hay for a better market, and towards the coming time of need, where barn room is wanting, the hint given in your paper of the 8th inst. and subscribed "DORCHESTER," is well deserving of notice.

The time for cutting the stalks of Indian corn is near at hand, and I shall improve this opportunity to point out a manner of curing them, prac-

tised by many careful farmers, and which will not fail to prove satisfactory to those who have not yet adopted the same. After cutting them by fair weather, they should be gathered the next or following day, tied in small bundles at the upper end, and set immediately, not too close, on poles fixed in the barn across the beams, taking care to have the doors opened in the day time, that they may dry and season. In January those which remain, ought to be taken down and packed close together, to prevent their getting too dry. The usual method of making small stacks of them round the fields, exposed for weeks to the wind, the dew, and the rain, is a dreadful waste of this article, which if cured as above, makes a sweet and excellent fodder.

With much esteem, I am your friend, &c.

Weston, August 26, 1828.

FOR THE NEW ENGLAND FARMER.

CANKER WORMS.

MR FESSENDEN—I observed in my last Friday's paper a communication from W. of Lynn, dated August 5th, 1828, stating that the orchards in that town had, for several years, been infested with the canker-worm, and that every expedient had been resorted to for the preservation of the trees, but none have been successful except tarring. No doubt the writer is correct as relates to tarring. But if this mode of warfare should prove a complete annihilation of all the host of canker worms in an orchard, yet the campaign would be so long and tedious that I should attempt to take the castle by storm. I would not disturb the caterpillars till the leaves were cut; and when they commenced their depredations, and were feasting on the green leaves, I would come upon them as suddenly as did Cyrus and his army upon the king of Babylon and his nobles, when they were banqueting together. My mode of attack would be to take some rye straw, in a calm time, after sun-set, and scatter it round the trees, about co-extensive with the branches of the trees. Then scatter some sulphur, or roll brimstone powdered, amongst the straw. Then scatter a little fire amongst these combustibles; and my word for it, when the smoke and the fragrance of the brimstone shall ascend together like a cloud among the limbs and leaves, not a living creature will remain which will not feel as much agitated as did the Pacla of Egypt when he beheld the ruins of his fleet at Navarino. The caterpillars will quit their hold, and become an easy prey to the devouring element.

South Sandwich, Aug. 19, 1828.

Remarks by the Editor.—If the above mentioned mode of attacking canker-worms should not prove too troublesome and expensive, it would probably be advisable. Forsyth recommends burning of rotten wood, weeds, potatoe vines, wet straw, &c. on the windward side of the trees when they are in blossom, as a remedy against blight and caterpillars. But experiment alone can decide on the efficacy of the measure proposed by our correspondent as a remedy against canker-worms. What quantity of smoke the insects would endure, and the trouble and expense

of making such a fumigation as would prove their destruction, are matters to be decided only by experiment.

FOR THE NEW ENGLAND FARMER.

SMUT IN INDIAN CORN.

MR FESSENDEN—The fields of corn in this region perhaps never looked more promising than at the present period, with one exception only.—That is the unusual quantity of *smut ears*; and no one is in possession of any knowledge how to prevent this evil. Should you be in possession of any method to prevent smut, and would be pleased to make it known through the columns of your very useful paper, you would confer a very great favour on a Subscriber.

South Sandwich, Aug. 19, 1828.

Remarks by the Editor.—We have never observed a crop of Indian corn, which was not in some degree affected with what are commonly called "*smut ears*." The evil, however, has not, so far as our notices have extended, proved of much magnitude; the smut ears being comparatively few in number, and easily separated in husking from the sound corn. We should be much obliged to the cultivator, who would give us further information relative to this disease in one of our most valuable vegetables, and its remedy, if any has been discovered.

SEPTEMBER.

Be most exceedingly careful to gather all the apples, pears, cherries, &c. which fall prematurely from your trees, and are technically called windfalls, and boil them for your swine, bury them a little this side of the centre of gravity, or so dispose of them as to destroy the worms they contain; otherwise the plague of wormy fruit will, for aught that I know to the contrary, be entailed on you and your heirs for aye. Your hogs will fatten the faster if you give them every day or two a little charcoal. They will take quantum sufficit of it as a medicine to neutralize the acid of their stomachs, and you have only to place it where they can get at it, and every hog will be his own doctor, and charge nothing for his fees. If you feed your hogs with old corn, you will soak, boil, or grind it, otherwise a part will not be digested. Their food will go the further if permitted to ferment till it has a sweetish taste, but should be given to them before it becomes decidedly sour. You may as well have a hole in your pocket for your money to escape from, as a drain to lead away the wash of your barn yard. True it may spread over your grass land, and do some good, but it will give a flood of manure to some parts, a scanty rill to other parts, and some will go to enrich the high way, &c.—[New England Farmer's Abolition.]

The quick and most certain Mode of raising the Mulberry Tree, is from cuttings of the old branches. Take a branch in the month of March, eight or nine feet in length; plant it half its length in any good soil, and it will succeed to admiration, producing fruit the following spring. This I have witnessed in several instances.—J. Youell.

[From the N. Y. Statesman.]

ORNAMENTAL TREES.

This is emphatically the season for realizing the importance, the convenience, comfort, and beauty of shades. Who that has been sheltered from the influence of a torrid sky, and has reposed in the coolness of umbrageous walks in this hot month, will grudge a little expense and labour during Spring and Autumn in augmenting the number of ornamental trees? The public squares and private enclosures of the city have been greatly improved in this respect within a few years; and nothing can be more grateful to the eye, or more conducive to health, than the quantity and freshness of foliage which in many places conceals our brick walls and protects our streets from the glare of a summer sun.

If this is the season to remind us of the importance of increasing the stock, it is also the best time for ascertaining the comparative beauty and value of different kinds of trees, the various characters of which are as strongly marked as those of men. Elegance of form and depth of foliage are perhaps the best general tests. From the almost endless variety which our forests and nurseries afford, good taste will select those that are most appropriate and best adapted to different locations. That prin, stiff, unmeaning, shadowless, dirty, exotic, the Lombardy poplar, ranks and files of which have invaded our shores, and driven back the natives of our own woods, is now, we hope, proscribed by universal consent, and will be exterminated as soon as possible. Among the kinds in our view most worthy of propagation, as well from ease of culture, as on account of its intrinsic beauty and density of shade, is the weeping willow. Some of its characteristics are drawn in the subjoined extract from a work lately published by a practical horticulturist. To the associations of the beautiful tree, the author might have added the allusion to it in that pathetic and exquisite specimen of sacred poetry, contained in 137th Psalm;

"By the rivers of Babylon, there we sat down; yea, we wept, when we remembered Zion. We hanged our harps upon the willows in the midst thereof."

From Prince's Treatise on Horticulture.

Salix Babylonica, or Weeping Willow.—This is more disseminated in our country than any other exotic species, and may be considered as the most ornamental of the whole number. It is partial to a moist situation, and is said to be a native of the banks of the Euphrates, whence its specific title, it, however, flourishes in almost any situation, spreading its roots to a great distance in the earth, and extracting, by their wide extension, the necessary sustenance for a lofty development. It will attain to the height of from forty to fifty feet, or more, forming a fine, majestic and spreading head, with its long pendulous branches gracefully drooping on all sides; and this tree is calculated, when standing distinct, to form, by its fine outline and peculiar elegance, one of the most pleasing variations in ornamental pleasure grounds. Its growth is very rapid, and it consequently soon becomes of a size to afford shade and ornament. It is said, that in ancient times lovers' garlands were made of the wreaths of this tree, the branches of which are so slender and pliable. It has also, in latter years, been fre-

quently selected as suitable for planting in burial grounds, or to mark the existence of insulated tombs; and a tree of this species now droops its branches over the remains of that arbiter of empires, Napoleon. From respect to the memory of Napoleon, branches have been plucked from this tree, and planted in our American gardens, several of which are now flourishing at Newport and at Providence, as well as at the establishment of the author. A distinct species of Willow has, however, been dedicated to him by botanists, under the title of *Salix Napoleonica*.

New present of Fruits to the Citizens of the United States, by Thomas A. Knight, Esq.

It would, indeed, be an unpardonable neglect in the Trustees of the Massachusetts Agricultural Society, to fail in putting upon record, in their journal, the following generous and public spirited letter from Mr. Knight. It should be known, that the box mentioned in the following letter, was a duplicate. Mr. Knight having despatched the same plants the year before, which, owing to the negligence of a carrier, were utterly lost; I am now able to state, more precisely, the fate of the trees and scions sent, though many of the scions are still in a doubtful condition. There were six pear trees sent, which are all alive. Three of them are known; Oakley Park, No. 3—Downton, No. 5—the Lowell pear ripening in England as late as May—three trees are unknown, the labels having been detached on the passage. There is a moral certainty, however, that these are No. 1, 2, and 4. All the other pears in Mr. Knight's list were sent as scions; they were all numbered by notches on the scions clearly distinguishable, but there were no scions marked 1, 2, and 4. Of course the trees whose labels were lost, were these numbers; but we shall only know them when they bear fruit, unless Mr. Knight shall replace them, which we have no doubt he will.—The nectarine trees are all alive; so are the cherries and the fig trees, and the Siberian apple, so highly praised as a cider apple.

As to the scions—No. 7, the one most highly spoken of by Mr. Knight, are growing and out of danger. No. 15 is also growing—so that of the pears in my possession, eight varieties, entirely new, are secured. Some others are yet fresh, and may grow. I divided the scions between myself and Gorham Parsons, Esq. whose great accuracy, and care, recommended him to me, as one of the fittest persons to secure the feeble and unpromising grafts. I have not heard what has been his success. The grapes, the Verdelho, and striped fruited grapes, were cuttings; two of the first, and one of the second, are now growing. Some of them were grafted into the roots of other grapes, and are also growing.

I have now only to add, that I shall be ready to give buds to such as may ask for them, till the stock shall have been exhausted; and I beg it may be considered, as a special favor to me, that persons disposed to take care of them, shall apply for them. It is a trust for our country, which I am anxious to discharge with the fidelity, which Mr. Knight expects from me. He considers me as his agent to spread these fruits as widely as possible, and I would endeavor to shew, that the confidence has not been misplaced.

JOHN LOWELL.

Here follows a letter from Mr. Knight, to Mr. Lowell, published in our last vol. p. 323.—Ed.

HAY AND FODDER.

Great losses are annually sustained in some parts of the United States in making hay, and in others in curing corn blades, commonly called fodder. Mine, in the course of many years, have, I think, amounted to a moiety of the crops; and most of the expedients I have resorted to, for avoiding these losses, have been but partially beneficial. Grass loses much both in quantity and substance by an exposure to the sun in curing it, and fodder more, being thus exposed in small bundles. Both, and particularly the last, suffer greatly by dews and rains. This year I have made the most promising experiment for remedying these evils. A large meadow in bottom land, of a grass called red-top or herd's-grass, was cut in dry weather, and shocked in large shocks quite green, but dry; that is, not wet with either dew or rain in the following mode. Four sticks of five feet long, of the thickness of a man's wrist or more, were set up in a square of two feet wide at bottom, and meeting at top in a pyramical form, where the shock was to stand. One at least of these sticks should be forked at top, to keep them steady whilst the hay is putting round them. A round log, about six feet long and six inches in diameter, was laid upon the ground, with one end reaching to the centre of the two feet square between the sticks, and the other raised upon a fork about eighteen inches, for the purpose of enlarging the flue presently mentioned, lest it should be closed by the pressure of the hay, and that the log may be easily drawn out, when the shock is finished. Around and over the sticks, the shock was made, its top reaching two or three feet above the top of the sticks. The purpose of the log, was to make a flue for the admission of fresh air into the centre of the shock, and the expulsion of the air heated by the fermentation of the grass in curing. The flues were made to face the point from which the wind usually blows at the time of hay making. If any flues happened to be closed by the pressure of the grass, they were easily opened by a smaller and pointed log; or, when the largeness of the shock threatened this inconvenience, it was effectually prevented by inserting into the flue a short forked stick as soon as the log was removed, to hold up the hay. As the logs are removed as soon as the shock is finished, two or three are sufficient for following a dozen of mowers. The hay thus made is the best I ever saw, and the efficacy of the mode of curing it, was strongly supported by the growing grass under the shocks having been uninjured; whereas I never left shocks so long in one spot before, without its having been killed by the undissipated fermentation of the hay in curing. Corn blades or fodder, sustain an immense loss, even in dry weather, by two or three days' exposure to the sun and dews; and in wet they are nearly ruined. For an experiment, I shocked them in the mode just explained, quite green and dry; but I chiefly allowed them from four to eight hours in the sun, before they are shocked. Thus was made the best fodder I have seen. But the weather was favorable. The ends of the blades were laid outwards, and the shocks bound at top by a rope made of the blades.—Taylor's Arator.

ORCHARD GRASS.

The following is the substance of a letter, written by a gentleman of Richmond, Va. to a distinguished agriculturist of South Carolina, and published in the last number of the American Farm-

er. The observations, though intended for the Southern States, will, we believe, apply with little variation, in New England. The experience of John Prince, Esq. of Roxbury, and of other New England agriculturists, is favourable to orchard grass, and seems to sanction the encomiums, which it has received in the southern section of the Union:—

Richmond, Va. August, 1828.

Dear Sir—Yours of the 8th. ult. has been received, and I take pleasure in complying with your request in giving you my views in relation to the most valuable grasses cultivated in this neighborhood, with my opinion as to those best adapted to your soil and climate, and the probability of your success in an attempt to grow them."

For the last eight or ten years both myself and my neighbors, many of whom are amongst the most scientific, practical and observant farmers in our state, have bestowed much attention and been at some expense in the selection and cultivation of those grasses generally esteemed the most valuable, and after a full and fair experiment of all such within our reach, we have been led to the conclusion that the orchard grass (*Dactylis glomerata*) combines more valuable properties and possesses superior advantages to any other. It is about ten years since the orchard grass was introduced into my neighborhood, and the experience of every year increases our opinion of its value.—

For your information I will now state some of the valuable properties which induce us to give it the preference to the other. The orchard grass grows rapidly and upon soils too much exhausted to bring clover, it resists the hoof and the tooth and bears the frosts of our winters and drought of our summers better than any other; from this circumstance it affords the earliest and latest pasturage: it is amongst the most nutritious food for fattening cattle and for milch cows; for sheep pasture it is unequalled, as even in our climate it affords an abundant bite throughout the winter; indeed I have for several years past supported my flock of sheep upon it exclusively, never giving them a mouthful of any other food, except when a fall of snow rendered it inaccessible to them, and I have in the months of February and March killed as fine fat mutton off my orchard grass fields as you could desire to see; this grass possesses the remarkable peculiarity, that it does not, like the second growth of every other grass, cause that excessive flow of saliva which is so debilitating to horses and other stocks; for land intended for permanent pasture, I should prefer it to any other, as I have never had occasion to renew a field which had been once sown with it; while clover, timothy, and I believe every other grass require to be renewed every few years; indeed from the following fact, I should conclude that it would never (as farmers say) run out. Nearly thirty years ago a lot near Ellicott's mills was sown with orchard grass, and for several years fine crops of hay were cut from it; however, from neglect, the fencing got out of repair, and the lot was turned out into the common exposed to the whole stock of the village for a number of years; the proprietor again took the management of the property, a few years ago, and without sowing a grain of seed, has annually cut fine and heavy crops of hay from it. For hay it is thought to be at least equal to timothy which has generally been esteemed our best grass. Judge Peters of Philadelphia (the president of the Philadelphia Agricultural Society)

whom you no doubt know by character, who has cultivated it for nearly forty years, thinks it decidedly superior to timothy, and gives it the preference to all others. Notwithstanding the well known prejudice of agriculturists against all innovations upon long established practice, and their almost unconquerable repugnance to every thing like improvement, we find that the reputation of this grass and its cultivation, wherever it has been introduced into a neighborhood, is most rapidly extending; indeed, so great has been the request for the seed, that for several years past the supply has been inadequate to meet the demand.

As to the probability of its succeeding in your section of country, the soil of which you describe, as consisting "principally of a fine black mould or loam, with a large proportion of sand to the depth of five or six inches," I can only state, that I have never tried the orchard grass on such a soil, nor is there any of so light a description in my neighborhood; but it is now cultivated on the eastern shore of this state, the soil of which I should suppose very much to resemble yours; it is also cultivated by a friend of mine on James River, Va. whose soil and sub-soil answers precisely to the description given of yours; he finds it to thrive well and thinks it a most valuable grass. From a fact of its resisting the parching droughts of our summers, which for the last 6 or 8 years have almost invariably destroyed our clover and other grasses, I can hardly have a doubt of its proving a most important acquisition to your southern country; and the circumstance of its bearing so well the severity of our winters induces me to believe that in your climate it would remain in full verdure throughout the year. I have cut from it two crops of hay in the same season, and with you it will certainly bear more.

The usual time of sowing the orchard grass, here, is in the spring with oats, or on the wheat or rye sown the preceding fall, or in autumn, at the time of sowing wheat or rye. We generally prefer sowing in the fall, and with you it would unquestionably be best—as it would enable the grass to take such root, and get such a growth, that it would not be endangered by the hot sun of the succeeding summer; if not convenient, it might be sown alone without the covering crop of wheat or rye. In your soil and climate, I should suppose that it would answer well to sow it at any time during the month of September, October, or November, although I think the earlier the better. The crop of grass will be light the first season after it is sown, but you will find it to thicken very much afterwards. Since the general failure of our clover crops, we consider the orchard grass as more fertilizing and improving to the soil, than any other, from its thick covering affording such complete protection from the frosts and sun. The quantity usually sown is from one to two bushels per acre. I should prefer the latter quantity, as the seed is light and chaffy. The period of cutting it here is about the middle of June, but of course would be earlier with you; the proper time being when the seed is formed and is matured.

I have thus (although imperfectly I fear) given you my views in answer to the queries propounded in your letter, but for a more full and particular account of the valuable properties of the orchard grass, than the compass of a letter would permit, I would refer you to several communica-

tions from Judge Peters and others, published in the early volumes of the American Farmer.

In conclusion, I would barely remark that if your state should (as from certain indications she now seems disposed) turn her attention to grazing stock and rearing sheep, I am convinced that in the orchard grass she would find that she had acquired a most important desideratum, and that it richly merits the reputation it possesses whenever it has been tried. It is hardly necessary for me to add that if you should at any time hereafter wish any further information upon the subject, that it will give me pleasure to furnish any which I may possess. I am with respect,

Your obed^t serv^t,

Hon. _____

South Carolina.

TO SAVE ORCHARD GRASS SEED.

When the head has a whitish cast, and when shook, the seed drops, cut it with the sickle or cradle, lifting the grips out of the cradle; handle grips or swaths as little as possible; therefore, neither bind them or shock them, but let them be gently gathered and carried into the barn floor in a sheet, by hand, or in a cart on sheets spread in the bottom of the cart; beat it out by grips, by striking the grips against any instrument; for instance, a narrow plank, fastened either perpendicularly or horizontally, or by any other contrivance; four strokes, generally, will take out all the seed without the chaff; riddle it; the seed will go through, the stalks, &c. will remain in the riddle to be thrown away; lay down the beaten grips in a pile till you clean up the floor, with the butts even; bind them in sheaves, to be cut and mixed with chop, bran, shorts, &c. for feed to stock. By this process, the hay is not lost, which would be the case by threshing, instead of beating out the seed. Two men will clean 50 bushels a day.

A good teamster.—Mr. William Bradford has for three years and three months past, with a six horse team, freighted to Boston, for one Company in this village, (various kinds of country produce,) eighteen tons, fifteen hundred, two quarters and nine pounds—has freighted merchandize from Boston, one hundred and fifty-eight tons, eighteen hundred, and nineteen pounds; for which he has been paid in cash four thousand eight hundred and twenty dollars. He has with the same team and during the same time, freighted to and from Boston, for the Strafford Copperas Company and others, one hundred and eight tons, seven hundred, two quarters, and two pounds; making an aggregate of three hundred and forty-nine tons, one hundred and two pounds. This has all been done with six horses without changing, with the exception of two horses for the last three months, averaging seventeen trips per year. His time of arrival and departure has been as regular as the United States mail stage. What is very remarkable, during all this time he has not drank a drop of spirits, wine, cider, or strong beer; nor has he at any time moved his team on the Sabbath.—*Montpelier, Vt. paper.*

—It is said that geese may be advantageously fed on turnips, cut in small pieces, similar to dice, but not so large, and put into a trough of water.

Learning is an ornament in prosperity, a refuge in adversity, and the best provision in old age.

Directions for the Rearing of Silk Worms, and the Culture of the White Mulberry Tree. Published by the Pennsylvania Society associated for the Promotion of those Objects. Philadelphia. 1823.

The above is the title of a pamphlet which we lately received by the kindness of Dr. Mease. It appears to us to be very well calculated for the uses implied by its title, and we shall therefore proceed to place before our readers such portions of its contents as point most plainly to such processes as are indispensable to success in the manufacture of silk.

Procure eggs in February and March, and choose those of a pale slate or clay colour; avoid all which are yellow, as they are imperfect. Keep them in a cold, dry place, (where water will, however, not freeze,) until the leaf buds of the mulberry begin to swell. If the eggs be soiled, dip the paper or cloth to which they adhere, in water once or twice, to wash off the coat with which they are covered, and which will impede the hatching of the worms.* Dry them quickly in a draught of air, and put them in one or more shallow boxes, lined with paper; which place, if possible, in a small room, of the temperature of 64°, and keep it up to that degree for the two first days, by means of a fire in the chimney, or still better, in a brick, tile, or porcelain stove; or for want of these, in an iron stove; and use tanners' waste bark, turf, or charcoal for fuel, to promote and keep up a regular heat day and night. The third day increase the heat to 66°, the fourth to 68°, the fifth to 71°, the sixth to 73°, the seventh to 75°, the eighth to 77°, the ninth to 80°, the tenth, eleventh and twelfth to 82°. It is impossible to expect regularity in hatching, if reliance be placed upon our variable weather; and it is the regularity of the worms coming forth, which will insure their uniform growth, save much trouble in feeding and attending those of various ages, and cause the whole or the greater part, to form their cocoons at the same time, provided proper care be given during their progress.

When the eggs assume a whitish hue, the worm is formed: cover the eggs with white paper, (never use a newspaper,) pierced full of holes the size of a large knitting needle; the worms, when hatched, will creep through them; turn up the edges of the paper to prevent their crawling off. Lay twigs of the mulberry, having two or three dry and young leaves, on the paper, to collect the worms, and move as they continue to mount. For want of mulberry leaves, feed for a short time upon lettuce leaves, perfectly dry; if large, they should be cut in strips, and the mid-rib thrown away; or still better, feed with the twigs of the white mulberry tree, cut up fine. The worms first hatched are the strongest; nevertheless, if only a few come out on the first day, give them away, to save trouble, and depend upon those which appear on the second and third days. Give away also the produce of the fourth day, and then the whole stock will go on regularly. If it be wished to rear all that are hatched, endeavour to keep the produce of each day separate, by numbering the boxes and shelves. When the leaves on the twigs are loaded with worms, they are to be gently placed on clean stout white paper, laid on frames with crossed rattans, giving them a plenty of room. The shelves over which these frames should slide, may be four feet square,

and fixed to upright posts—they may be multiplied as required. Whether a distinct building or apartment in a dwelling house be devoted to a large parcel, it is absolutely necessary to secure the command of a gentle circulation of air, by having ventilators in the windows, floors, and doors.

One or more tin circular ventilators in place of panes of glass, would always ensure a regular circulation in the apartment: they may be stopped when their motion is not required. Red ants are deadly enemies to silk worms; to prevent their attacks, the posts containing fixed shells must not touch the ceiling, nor must the shelves reach the walls; the lower parts of the posts should be smeared with thick molasses. If the worms are fed on tables or moveable frames, their legs may also be smeared with molasses, or put in a dish of water; guard also against cockroaches, mice, and other vermin.

The worms being all hatched, whether they are to remain in the first apartment, or be removed to another room, or distinct building, the heat must be reduced to 75°; for, as the worms grow older they require less heat.

It is impossible to ensure the regular hatching of the worms without the use of a thermometer, which may be bought for \$2 50.

[To be continued.]

From Fessenden's New American Gardener

PRESERVATION OF APPLES.

Apples keep best in a low temperature, and may be well preserved in an ice-house. An English journal recommends the use of dry pit sand for preserving pears and apples. Glazed earthen jars are to be provided, and the sand to be thoroughly dried. A layer of sand an inch thick is then placed in the bottom of the jar; above this a layer of fruit, to be covered with a layer of sand an inch thick; then lay a second stratum of fruit, covering again with an inch of sand. An inch and a half of sand may be placed over the uppermost row of fruit. The jar is now to be closed, and placed in a dry situation, as cool as possible, but entirely free from frost. Some assert that apples may be kept in casks through the winter, in a chamber or garret, by being merely covered with linen cloths. Apples, which are intended for winter's use, should be suffered to hang on the tree as long as they are safe from frost.

Cobbett says, "To preserve apples in their whole state, observe this, that frost does not much injure them, provided they be kept in total darkness during the frost, and until they be used; and provided they be perfectly dry when put away.—If put together in large parcels, and kept from the frost, they *heat*, and then they *rot*; and those of them that happen not to rot, lose their flavour, become vapid, and are, indeed, good for little. This is the case with the Newtown pippins that are sent to England, which are half lost by rot, while the remainder are poor, tasteless stuff, very little better than the English, the far greater part of which are either sour or mawkish. The apples thus sent have every possible disadvantage. They are gathered carelessly, tossed into baskets, and tumbled into barrels at once, and without any packing stuff between them: the barrels are flung into and out of wagons; they are rolled along upon the pavements; they are put into the

hold, or between the decks; and is it any wonder, that a barrel of *pomace*, instead of *apples*, arrives at London or Liverpool! If, instead of this careless work, the apples were gathered, (*a week before ripe*;) not bruised at all in the gathering; laid in the sun on boards or cloths three days to let the watery particles evaporate a little; put into barrels with fine cut straw-chaff, in such a way as that no apple touched another; carefully carried to the ship, and put on board, and as carefully landed; if this were the mode, one barrel, though it would contain only half the quantity, would sell for as much as, upon an average, taking in loss by total destruction, twenty barrels sell for now. On the deck is the best part of the ship for apples; but, if managed as I have directed, between decks will do very well. In the keeping of apples for market or for house use, the same precautions ought to be observed as in gathering and laying out to dry; and, perhaps, to pack in the same way, also, is the best mode that can be discovered.

"Dried apples is an article of great and general use. Every body knows that the apples are peeled, cut into about eight pieces, the core taken out, and the pieces put in the sun till they become dry and tough. They are then put by in bags or boxes in a dry place. But the flesh of the apple does not change its nature in the drying; and, therefore, the finest, and not the coarsest apples should have all this trouble bestowed upon them."

The following valuable observations, contained in a letter from Noah Webster, Esq. have been published in the *Massachusetts Agricultural Repository*:—

"It is the practice with some persons to pick apples in October, and first spread them on the floor of an upper room. This practice is said to render apples more durable by drying them. But I can affirm this to be a mistake. Apples, after remaining on the trees as long as safety from the frost will admit, should be taken directly from the trees to close casks, and kept dry and cool as possible. If suffered to lie on a floor for weeks, they wither and lose their flavour, without acquiring any additional durability. The best mode of preserving apples for spring use, I have found to be, the putting them in dry sand as soon as picked. For this purpose, I dry sand in the heat of summer, and late in October put down the apples in layers, with a covering of sand upon each layer. The singular advantages of this mode of treatment are these:—1st. The sand keeps the apples from the air, which is essential to their preservation. 2d. The sand checks the evaporation or perspiration of the apples, thus preserving in them their full flavour; at the same time, any moisture yielded by the apples (and some there will be) is absorbed by the sand: so that the apples are kept dry, and all mustiness is prevented. My pippins in May and June are as fresh as when first picked: even the ends of the stems look as if just separated from the twig."

Apples, it is said, may be well preserved by packing in any kind of grain; also in paper cuttings of the book-binder; or in shallow pits, between layers of turf, the grassy side inwards, with a sufficient covering of straw and turf to protect them from frost; likewise in dry flax-seed chaff, or pulverized plaster of Paris.

A letter from Ebenezer Preble, Esq. published in the *Massachusetts Agricultural Repository*, Vol. iv. No. i. p. 24, contains the following useful di-

* It is not necessary to scrape off the eggs from the paper or cloth on which they have been deposited.

rections on this subject:—"The general method of gathering apples for cider, is, shaking the tree, and thrashing the branches with poles. The former will answer when the fruit is at maturity; they will then drop without injury to the buds.—Poles should never be used but with a hook at the end, covered with cloth or mats to prevent wounding the bark; they then serve to shake the small limbs. Particular attention is required in gathering winter fruit. They should be taken in the hand, the fingers placed at the foot stalk, and, by bending it upwards, the fruit is gathered with ease, and without injury; they should be moved from the gathering baskets with great care." &c. The same writer says, "The injudicious method practised in gathering fruit, is more destructive in its consequences, than is generally understood: the blossom buds of the succeeding year are placed at the side of the foot stalk of the fruit, and if the spurs are broken, no fruit on that part will be produced."—See further, FRUIT.

Use.—For pies, tarts, sauces, and the dessert, the use of the apple is too well known to require description. In France, bread is made consisting of one third of boiled apple pulp, baked with two thirds flour, properly fermented with yeast for twelve hours. This bread is said to be very fine, full of eyes, and extremely palatable and light.—Apples, by furnishing cider, a grateful and salubrious liquor, have a tendency to diminish the consumption of ardent spirits. Besides, apples are thought to alter and ameliorate the taste and the tone of the human system, in such a manner as to destroy that artificial appetite, which is gratified by the deleterious preparations of alcohol.—"The palate," says Mr Knight, a celebrated English horticulturist, "which relishes fruit, is seldom pleased with strong fermented liquors; and as feeble causes, continually acting, ultimately produce extensive effects, the supplying the public with fruit at a cheap rate, would have a tendency to operate favourably, both on the physical and moral health of the people." In medicine, verjuice, or the juice of crab-apples, is used for sprains, and as an astringent and repellent. The good table apple, when ripe, is laxative; the juice is useful in dysenteries; boiled or roasted apples fortify a weak stomach. "Scopoli," says Loudon, "recovered from a weakness of the stomach and indigestion from using them; and they are equally efficacious, in putrid and malignant fevers, with the juice of lemons or currants." "In diseases of the breast," says Dr. Willich, (*Dom. Ency.*) "such as catarrhs, coughs, consumptions, &c. they are of considerable service. For these beneficial purposes, however, they ought not to be eaten raw, but either roasted, stewed, or boiled. They may also be usefully employed in decoctions, which, if drank plentifully, tend to abate febrile heat, as well as to relieve painful strictures in pectoral complaints."

Apples have also been recommended as food for horses and farm stock, for which purpose sweet apples are of the greatest value.—See *N. E. Farmer*, vol. v. p. 82. Sweet apples are said, likewise, to afford a saccharine matter, which is a good substitute for molasses. For this purpose the apples are ground and pressed in a cider mill, and the juice boiled immediately, the scum being taken off till it is reduced to a proper consistence.

The following process for making apple jelly has been recommended:—Pare and quarter the apples, and remove the core completely. Then

put them into a pot, and place it in a heated oven, or over a slow fire. When well stewed, squeeze out the juice through a cloth, to which add a little of the white of an egg. Boil it to a proper consistence, skimming just before it begins to boil.

BENE PLANT, (*Sesumum Orientale*.)

Mr Editor—The mucilage obtained from the leaves of this plant has proved very beneficial in some of the middle States, in the summer complaints of children, and was administered successfully last season to upwards of two hundred persons at the PAVILION. The seeds of the Bene or Sesamum are a great article of food in Egypt and the East, and furnish an oil said to be superior to that of the olive.—The magic power of the word *Sesame*, will always be remembered by those who have read the Arabian Tales.

Doctor James Smith, of the Vaccine Institution, Baltimore, says, "one leaf of this plant immersed in a tumbler of spring water, changes it immediately into a fine mucilage, that is perfectly clear, tasteless and inodorous, and very useful in the summer complaints of children, the dysentery, &c. Sick children take it as they would pure water, and as it is perfectly innocent, they may be allowed to take as much of it as they like."

The leaves of this rare and valuable plant may be obtained gratis at the PAVILION.

THE SHELTON OAK.

This stately tree stands on the road-side, where the Pool road diverges from that which leads to Oswestry, about a mile and a half from Shrewsbury; whose spires form a pleasing object in the distance; whilst above them, the famous mountain called the Wrekin, lifts its head, and inspires a thousand social recollections, as the well known toast that includes all friends around its ample base is brought to mind by the sight of its lofty summit. The appearance of the Shelton oak, hollow throughout its trunk, and with a cavity towards the bottom, capable of containing half a score of persons, sufficiently denotes its antiquity. Tradition informs us that just before the famous battle of Shrewsbury, June 12, 1403, headed on one side by Henry Percy, surnamed Hotspur, Owen Glendower, the powerful Welch chieftain, and the firm adherent of the English insurgents, ascended this tree, and from its lofty branches, then most probably in the full pride of their vigor, reconsidered the state of the field: when finding the king was in great force, and that the Earl of Northumberland had not joined his son Henry, he descended from his leafy observatory with the prudent resolution of declining the combat, and retreated with his followers to Oswestry.

The great age of the Shelton oak, thus pointed out by the tradition which connects it with the name of Glendower, is likewise attested by legal documents belonging to Richard H. Waring, Esq. whose ancestors possessed lands in Shelton and the neighborhood, in the reign of Henry III., probably deriving them from Waring, son of Athlet, a Saxon, who had land in the market place of Shrewsbury before the use of dates was known. Among this gentleman's title-deeds is the following paper, subscribed, "per me Adam, Waring," and entitled, "how the great oak at Shelton standeth on mye groundes." [Here follows the transcript]. This extract will suffice to prove that the Shelton oak was esteemed a great one within one hundred and forty years of the battle of Shrews-

bury, and an object of remark to old people long before that period. The circumference of this tree at one foot and a half from the ground, is *thirty-seven feet*; and at five feet from the ground, it is *twenty-six feet*.

From the American Farmer.

TO PREVENT THE DESTRUCTION OF BEES, BY THE BEE-MILLER.

Duran's Firey, Earth Co. N. C. July 8, 1826.

MR SKINNER.—Understanding that you are the publisher of a paper exclusively devoted to domestic industry and intelligence, and through which every subject upon domestic economy can be, and is readily communicated to the public; I take the liberty, through the advice of a friend, of making known to you, for publication, (should you think proper to publish the same,) my method of preventing the destruction of that useful insect, the Bee, by what is usually called the Bee-miller, or Bee-worm.

I have, sir, for many years, been the raiser of bees, and was at one time much troubled with the bee-worm; but, upon examination, I found they always bred between the bench upon which the hive sat and the bottom edges of the hive. I first adopted the method of having the bottom edges of the hive brought to so small a point or edge as to afford them no shelter; but now, during the warm season, I raise the hive by placing small sticks around under the hive, so as to raise it, say about half an inch from the bench, which I take out during winter or the cold months.

And I can say, sir, that for many years I have seen nothing of the bee-worm, and that my stock of bees have increased as fast as I can or could wish.

Yours, &c.

NILEY HAMILTON.

BIRM, OR YEAST.

Dr Townson, in his "Travels in Hungary," gives the following recipe for making a ferment, which may be used as a substitute for yeast in the composition of bread.

"The ferment is thus made: Two good handfuls of hops are boiled in four quarts of water; this is poured upon as much wheaten bran as can be well moistened by it; to this are added four or five pounds of leaven; when this is only warm, the mass is well worked together to mix the different parts. This mass is then put into a warm place for twenty-four hours, and after that it is divided into two small pieces about the size of a hen's egg or a small orange, which are dried by being placed upon a board and exposed to a dry air, but not to the sun; when dry they are laid by for use, and may be kept half a year. This is the ferment, and it is to be used in the following manner: for a baking of six large loaves, six good handfuls of these balls are taken and dissolved in seven or eight quarts of warm water. This is poured through a sieve into one end of the bread trough, and three quarts more of warm water are poured through the sieve after it, and what remains in the sieve is well pressed out; this liquor is mixed up with so much flour as to form a mass of the size of a large loaf; this is strewed over with flour, the sieve with its contents is put upon it, and then the whole is covered up warm, and left till it has risen enough, and its surface has begun to crack; this forms the leaven. Then fifteen quarts of warm water, in which six handfuls of salt have been dissolved are poured through:

the sieve upon it, and the necessary quantity of flour is added, and mixed and kneaded with the leaven; this is covered up warm, and left for about an hour. It is then formed into loaves, which are kept in a warm room half an hour; and after that they are put into the oven, where they remain two or three hours according to the size. The great advantage of this ferment is, that it may be made in great quantities at a time, and kept for use."

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 29, 1828.

Extract of a letter to the Editor of the New England Farmer from a gentleman, who has been advantageously known to the American public by several useful works on scientific subjects.

TREATISE ON BEES.

DEAR SIR,—Since I had the pleasure of seeing you last, I have made considerable progress in the investigation of the subject of bees. By the help of reading, correspondence, and my own observation, I shall (I think) be able in a few months to produce a small work entitled "*A Practical Treatise on the Management of Bees, and the Establishment of Apiaries, &c.*" Such a work in a cheap form is very much wanted in our country, and I am surprised that it has been so long neglected.

We fully coincide with the writer of the above, that a treatise of the kind he proposes is much wanted; and we know of no person from whom a better work could be anticipated than what this gentleman has means and talents to enable him to produce.—*Editor.*

Yellow Locust.—The culture of this valuable tree has been recently prosecuted with great success in various parts of New England. A gentleman in Brunswick, Me. writes us as follows:—"The four ounces of Yellow Locust seed purchased at the New England Farmer office last autumn, has done finely, as well as all the other seeds purchased of you. I have now over 1000 Locust Trees from this seed, some four feet high, doing well on the sandy plains of Brunswick."

We are happy to learn that the Hon. Judge PITMAN has accepted the invitation to deliver an Address to the Rhode Island Agricultural Society at their next anniversary.—This Society has been distinguished for the excellence of its Addresses.

The Annual Cattle Show, Exhibition of Manufactures, and Ploughing Match, of the Worcester Agricultural Society, will be held in the town of Worcester, on Wednesday, the 5th of October.

EXHIBITION OF THE NEW ENGLAND SOCIETY.

On Tuesday last, notwithstanding the great heat of the weather, the Halls over the New Faneuil Hall Market were thronged with visitors to witness the exhibition of manufactures under the auspices of the New England Society. Between nine and ten o'clock, Gov. LINCOLN, who is President of the Society, entered the centre hall, attended by the members and several distinguished strangers, among whom were Gov. COLES of Illinois, Mr. SILVERSON of Virginia, Speaker of the U. S. House of Representatives, and Gen. MORRIS, of New York. After a very interesting address to the Society, the Governor proceeded to

declare the premiums which had been awarded by the Society for excellence in the several articles enumerated below. The address we hope soon to present to our readers.—*Patriot.*

FOR THE NEW ENGLAND FARMER.

GRAFTING.

MR FESSENDEN—I have seen some remarks in your papers as to grafting, which propose a wide course of experiment on this subject. There are some singular instances of the support of vegetable life, by this process, which seem opposed to those general laws which have been supposed to govern the vegetable kingdom. If we reason from analogy, as relates to the animal kingdom, it is wisely so ordered, by immutable, eternal laws, that the succession of beings of the same species is preserved separate and unmixed. Nothing unnatural can be continued; or, in other words, "monsters do not propagate."

As to many proposed experiments, as well as to some that are at present promising, it would be well to withhold too strong an expectation.

On the quince the pear is engrafted. This produces what is called the Dwarf. But of several hundred, I believe I may say, that I have imported, I have scarcely one that promises anything, if alive. The Borer is fond of, and fatal to them, so much so, that almost all that have been imported, or propagated, have nearly disappeared before this voracious devourer.

So also as to the Thorn, I must think it a mistake that the pear thrives on this stock, I have in so many instances found the contrary effect to take place. In all cases, though, the pear grafts thrive for one, and at most two years, it is then too scantily supplied, and the grafts perish, apparently for want of nutriment.

I do not wish, however, to discourage a zeal, which if it fail in its main object, must yet in its progress do much probably to enlarge or fix the boundaries of knowledge. I am bound, too, to state one experiment, acquired in the very pathway of your correspondent, which will be new to some of your readers. About thirty years ago, I engrafted a number of apple trees with pear grafts. In most cases the graft projected on one side, and they did not generally unite so as to recommend the practice. It was otherwise with one, however, which united well, and for fifteen or twenty years produced an abundance of fine St. Michael pears as could be had. I have often surprised my friends when they praised the pears, by telling them they grew on an apple tree.

There are cases where stocks may be beneficially selected for grafting or budding in the way alluded to—say of the almond for the peach. So also some have taken for like use the plum stock.

The almond is very hardy, and no insect at present meddles with them.

It is otherwise with the plum of late. Of the almond, I raise several bushels, and will give you what you may wish, if needed, for distribution hereafter.

I have little knowledge of Horticulture, my attention being devoted as far as time will admit, to my farm. But there are some of your correspondents whose practice has been thorough; and if not so, there are some, I perceive, who do not mean any thing should be lost for want of zeal and application. I am, sir, yours,

Dorchester, Aug. 26, 1828. J. WELLES.

See New England Farmer, vol. vi. page 391

FOR THE NEW ENGLAND FARMER.

THE BORER.

MR FESSENDEN—For several years I have been in the practice of destroying the borers in my apple, quince, and mountain ash trees, as recommended by a Committee of the Mass. Ag. Society, and published in Thacher's Orchardist, by the free use of the Chisel, though it has given me pain to think no method had been devised to destroy the worm without greatly injuring the tree by the operation. I have at last discovered a way to extract the borer, which is so natural, simple, and expeditious, that I am astonished it has not been thought of before. It is this.—Open the bottom of the hole (which is easily discovered by the appearance of powdered wood) with a knife, and insert a wire, sharpened, and bent into a small hook, and you will soon draw out this destroyer of trees, even if he has penetrated a foot or more into the wood.

Remarks by the Editor.—The notice of our respected correspondent, relative to his mode of destroying the Borer, will, no doubt, prove useful, and he will please to accept of our thanks for his communication. The use of a wire for the extirpation of insects of this description, has been before recommended by JOHN PRINCE, Esq. of Roxbury, see N. E. Farmer, vol. ii. page 342; also Deane's N. E. Farmer, page 363. In the New England Farmer, vol. iv. page 382, is the following Editorial article:

"LOCUST TREE BORER."

A horticulturist tells us that he has preserved his Locust Trees against the borer which has almost annihilated that fine tree in this part of the country, by first probing the holes made in the tree by the insects with a small flexible wire, a little hooked or curved at the end introduced into the tree. With this he destroys or extracts as many of the worms as possible. He then with a small syringe, injects into their holes strong soap suds, which puts a finishing hand to their destruction."

Remedy for Whooping Cough.—The following has been recommended for this complaint, which is now common:—Take equal portions of new milk and the lye strained from the ashes of hickory [white walnut] bark, of which one table spoonful may be given every hour through the day to a child seven years old.

POWER OF HABIT.

In regard to food, it is very certain that habit can raise us above the standard of ordinary men. "Meat and drink to which we are accustomed" says Hippocrates, "agree with us, though naturally pernicious; but not those aliments to which we are unaccustomed, though naturally wholesome;" and henceforth he concludes, that it is more beneficial to adhere to the same sorts of food than to change them abruptly, even though we substitute better in their stead. Alexander the Great, when in India, found it necessary to forbid his army the use of wholesome food because it carried off the men, owing to their not being accustomed to it. So true is the observation of Celsus, that "whatever is contrary to their habits, whether it be hard or soft, is prejudicial to health."

Liban informs us that the Ethiopians eat scorpions, and Mercurialis states that the West Indians eat toads; neither of these facts is without a

parallel in Europe. At Padua and Rome there were two children who ate scorpions, and a girl took pleasure in eating frogs, lizards, serpents, mice, and all sorts of insects. Another ate live lizards and caterpillars with pepper and vinegar. Of spider eaters, who grew fat upon those disgusting insects, we could collect half a dozen instances from different writers. Galen relates of an old woman, that she had gradually habituated herself to make a meal of hemlock; and Sextus Empiricus assures us, that there have been persons who have taken thirty drams of that poison without injury. A student at Halle accustomed himself on purpose to arsenic, which he took with his food, from a boy; and though it at first occasioned vomiting, yet in time he could bear a considerable quantity. Hence it is evident, how one who habituates himself needlessly to physic, breaks down the bridges which, in case of emergency, might carry him in safety over the abysses of disease.—*New Monthly Mag.*

Remedy for Cholera Morbus.—A friend assures us that the following simple prescription for Dysentery or Cholera Morbus, has been frequently tried, and, when made use of in season, with uniform success:—To half a tumbler of vinegar add as much fine salt as the vinegar will dissolve, and take it fasting. It will operate as a cathartic, and, if the stomach be quite foul, as an emetic likewise.

At Springfield, a young man has been fined \$10, and the costs were \$12—total 22—for taking some apples from a farmer's orchard. Not being able to pay, the young man was committed to prison.

The Nova Scotian of last week, contains a long article on the subject of Geology, in reference to a paper which has been published by Messrs. Jackson & Alger, two scientific American gentlemen, who have recently visited this Province, for the purpose of examining its geological and mineralogical productions.

We repeat the hope, that some effort will now be made, to form a Geological Society. This Province abounds in minerals and other valuable substances, to which the attention of such an Institution might be profitably directed; and the individual amusement and instruction that could thus be afforded, would be ample and unfeigned.

Halifax paper.

INTEMPERANCE.

I will make a suggestion to a portion of the community who suffer more, perhaps, from the evil, than all others. I mean wives and mothers. Would you know how to mitigate the evil?

First, then, never offer a drop of ardent spirit to a child, as you value your future comfort. The deplorable habit of intemperance is, I have no doubt, contracted in thousands of instances in the years of infancy and youth, merely from having the dregs of flip and toddy, which the father and perhaps the mother have been comfortably enjoying; and perhaps as many more have been seduced into the habit by the misguided prescription of a dose of rum and molasses, to relieve a trifling pain. If you wish your husband to abandon the use of it, never use any yourself; and never let a day pass without having plenty of beer, or some other beverage in your cellar, which he can have as a substitute. He must be fixed in his habits indeed, if he did not take it instead of having recourse to the rum bottle.

The Culture's power of Sight.—Professor Liebenstein remarked when travelling in South Africa, that if an animal chanced to die in the very midst of the most desert wilderness, in less than half an hour there was seen high in the zenith, a number of minute objects descending in spiral wheels, and increasing in visible magnitude at every revolution. These are soon discovered to be a flight of vultures, which must have observed from a height, viewless to the human eye, the dropping of the animal immediately marked out for prey.

Derivation of pony.—One of the literati was puzzling his brains about the derivation of pony, when a by-stander quaintly observed, "Sir, I am astonished you don't know what a pony is derived from."—"Why," said the man of learning. "Because," said the other, "every body knows that a pony is derived from a little horse and a little mare."

An article on the culture of the Raspberry is deferred till next week.

Thatcher's Orchardist.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, a further supply of

The American Orchardist; or a practical treatise on the culture and management of apple and other fruit trees, with observations on the diseases to which they are liable, and their remedies. To which is added the most improved method of manufacturing and preserving cider, and also wine from apple juice and currants. Adapted to the use of American farmers, and all lovers and cultivators of fine fruit. By James Thatcher, M. D. Fellow of the American Academy of Arts and Sciences; Honorary Member of the Massachusetts Medical Society, and of the New York Horticultural Society, &c. Second edition, much improved. Price \$1.00.

Seeds for Fall Sowing.

For sale at the New England Farmer Seed Store, a fresh supply of various Grass Seeds—also a great variety of vegetable seeds for fall sowing, viz. White Portugal Onion, Strasburg do. Silver skin do. Prickly Spinach and Dutch Cole for early greens—various kinds of lettuce, carrot, cucumber, cabbages, &c.—black Spanish or winter radish, &c. all warranted fresh.

Orchard Grass Seed—growth of 1828.

Just received at the New England Farmer Seed Store, No. 52 North Market Street,

20 bushels of prime Orchard Grass Seed, raised, this season, with the greatest care, by John Prince, Esq.—warranted to be equal in purity to any ever offered for sale in New England.

A supply of pure German Wheat, raised by Payson Williams and Mr. Winchester, is daily expected.

For Sale.

A Bull Calf five weeks old of the Short Horn breed, from the best Imported Stock, both Sire and Dam, well known and highly approved. Apply at this Office for price and particulars of pedigree.

It. August 20, 1828.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D." Boston through the post-office.

It. August 1.

Wild Geese.

For sale, five pairs of Wild Geese, two pairs three years old. Inquire of the subscriber. BENJ. L. PHILLIPS.

Lynn, August 16, 1828.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by B. C. Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturists in the vicinity of Boston and New York, is just published by J. B. Russell, Proprietor of the New England Farmer. The articles are arranged alphabetically, and comprise the most useful VEGETABLES and FRUITS which can be conveniently and economically cultivated in the climate of New England and the middle States; as well as a Treatise on FLOWERS, and on LANDSCAPE or PLEASURE GARDENS, on the general management of the SILK WORM, and the manufacture of SILK, and a Treatise on the culture of GRAPE VINES and the STRAWBERRY. The article on Fruit Trees contains an enumeration and description of all the Apples, Pears, Peaches, Cherries, Plums, Nectarines, Apricots, &c. &c. that can be raised to the most advantage, and their relative forwardness in bearing, which will be found to be of inestimable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written.

A list of the contents of the work will be found in the New England Farmer for August 1.

Price \$1.25—Six copies for \$6.00.

Hull's Trusses for Hernia or Rupture.

Dr. Amos G. Hull, feels a confidence in further illustrating the novelty and excellence of his invention. Having devoted many years to the science and practice of surgery, it affords him a pleasure in having brought into successful operation, a new and improved instrument for the painful and dangerous disease of Hernia. Various kinds of Trusses have of late been constructed, embracing the principles which belong exclusively to Dr. Hull's invention; among these are the "Spiral Spring Trusses," of Belar, Farr and Jesse R. Dorey. These trusses are in imitation of Dr. Hull's, though much less perfect instruments, as has been abundantly exercised by the experience and opinion of the most eminent surgeons in the country.

Dr. Hull takes this opportunity to caution all persons against an infringement of his patent, the validity of which has been fully established by judicial decisions, and particularly in his suit against Rogers, tried at the last term of the Circuit Court of the United States. In that case, Judge Thompson charged the jury, that the exceptions taken to the plaintiff's patent, were without foundation; that the speech of an ass in all respects sufficient and legal; that the invention of the plaintiff was one of great utility; the usefulness and novelty of which had been established by Physicians and Surgeons of the highest respectability. That it appeared very fully, in evidence, that this instrument was of the greatest value in surgery, had been the means of effecting cures, in cases where the art had failed before; had enabled persons afflicted with the disease, to resume to pursue their business and labours without inconvenience; and in fact its invention had formed a new era in the treatment of the disease; that the instrument sold by the defendant, the one known as Mr. Farr's, and the other as Mr. Dorey's trusses, were infringements of Dr. Hull's patent; and the jury in that case, brought in a verdict for the plaintiff, and the damages were trebled by the court with costs.

A large supply of the above Trusses are prepared, and for sale, by EBENEZER W. HILL, Druggist—Bank opposite Federal-st—Agent for Boston. August 29.

MISCELLANIES.

LINES WRITTEN IN A YOUNG LADY'S ALBUM.

BY THOMAS G. FESSENDEN.

Miss ANN, you are, it seems to me
An essence all ethereal;
The brightest being that can be,
Entirely immaterial.

A pencil tipped with solar ray:
Your charms could scarcely blazon
Contrasted with your beauty's blaze
Bright Sol's a pewter basin.

Transcendent little sprig of light,
If rhymes are always true,
An angel is an ugly sprite,
Compared to Sylph like you.

You frowning tell me, "this indeed
Is flattery past all bearing,
I ne'er before did hear nor read
Of any quite so glaring."

Yes this is flattery, sure enough,
And its exaggeration
May teach you how to hold such stuff
In utter detestation.

Should beaux your ladyship accost
With something like this flummery
Tell them their labour will be lost,
For this transcends their mummery.

The man whose favour's worth a thought,
To flattery can't descend;
The servile sycophant is not
Your lover nor your friend.

True generosity does not consist in obeying every impulse of humanity, in following blind passion for our guide, and impairing our circumstances by present benefactions, so as to render us incapable of future ones.—*Goldsmith.*

Husbandmen, manufacturers, and tradesmen.—He who expects to find the husbandman flourishing, while the manufacturers are out of employ; or the tradesman, on the other hand, in prosperity, while the former is in distress, "let him," as Fuller says, "try whether one side of his face can smile, while the other is perished."

German musicians.—The itinerant musicians in Germany, who go about the country in small bands like wandering troubadours, are a class so clever and eminent in their way, as to deserve notice. For a few florins these poor fellows will amuse you with such an exhibition of tone and skill, as would set up an English artist of the first water. They are a set of poor, but merry companions—with as little discord in their social intercourse as disturbs the harmony of their instruments. Happy, in spite of thread-bare coats, and sun-burnt faces—but with a gentility of mind, much superior to people of their class.

It is no wonder that when we are prodigal of nothing else, when we are over-thrifty of many things which we may well spare, we are very prodigal of our time, which is the only precious jewel of which we cannot be too thrifty, because we look upon it as nothing worth, and that makes us not care how we spend it. The laboring man and the artificer knows what every hour of his time is worth, what it will yield him, and parts not with it, but for the full value; they are only noblemen and gentlemen who should know

best how to use it, that think it only fit to be cast away; and their not knowing how to set a true value upon this, is the true cause of the wrong estimate they make of all other things.

Instinct in the ass.—An ass was shipped at Gibraltar, on board the frigate Ister, for Malta. The vessel having struck on a sand-bank off the Point de Gat, at some distance from the shore—the ass was thrown overboard, to give it a chance (a poor one, for the sea was running very high) of swimming to land. A few days afterwards, when the gates of Gibraltar were opened in the morning, the ass presented himself for admittance, and proceeded to the stable which he had formerly occupied, to the no small surprise of his landlord, who imagined that by some mistake he had never been put on board the Ister. On the return of the vessel to repair, the mystery was explained. The ass had not only swam safely to the shore, but without a guide, had found his way from Point de Gat to Gibraltar, a distance of more than two hundred miles, through a mountainous and intricate country, intersected by streams, which he had never traversed before; and, what is most wonderful, in so short a time that he could not have made one false turn.

THE WAY THEY DO THINGS AT THE SOUTH.

The Boston Courier says it is no uncommon thing to see in the streets of Washington, three or four yokes of half starved cattle, preceded by two miserable horses, drawing a small load of wood or hay. A letter from Natchez, Mississippi, to the editor of the American Farmer, contains the following:

I was transported in eleven days to this place, where I find all the tropical plants in full bloom in the gardens. The early fruits have disappeared, and plants are now in season. Vegetables of all descriptions are abundant; but what surprises me is, with the finest soil and extensive pasture, so little care is taken of it that butter now sells for 25 and 31 cents a pound; and the greatest portion of supply is brought from the state of New York, and 31 cents per pound paid for it.—I was told that forty cows would produce twenty four pounds of butter a week! There must be gross mismanagement some where. I observe the planters daily hauling corn out of their plantations to feed their hands and stock; this comes from up the river a considerable distance. They, I believe, pay attention to nothing but cotton, and purchase every thing else, instead of raising it.—It strikes me as poor economy, when it is observed, that eight oxen are employed to haul a load of corn, which four ought easily to carry; and when too they travel at a snail's gait, to suit the particular convenience of the driver, and indulge him in his lazy disposition.

The Potato Onion. lately introduced into this country, will be a most valuable acquisition to gardeners, as it is known to produce in equal abundance to the potato, from which it derives its name; never fails, as the severe frost has no effect on it.—*Dublin Correspondent.*

Miss Betsy Smith, a young lady who is employed in a cotton mill at Hooksett, N. H. wove, on the 8th inst. one hundred and seventy-eight yards of good shirting in thirteen hours on five looms; the yarn No 16, the cloth 7-8ths yard wide.

A farmer in Philadelphia cut his third crop of 1½ tons of hay in that city, on the 15th inst. and he anticipates one crop more. His farm is in the immediate vicinity of the spot where the Declaration of Independence was signed, generally called the State House Yard. If the hay were valued at the rent the ground would bring for building lots, it is said that it would be about 50 cents per spear.

A large cucumber.—Mr. H. Drake, of Hackett's town, plucked a cucumber from a vine in his garden, measuring fifteen inches in length, fourteen and a half in circumference, and weighed five pounds.—*New Jersey paper.*

HOVEN OR SWOLN CATTLE.

The *Giornale agrario Toscano*, communicates a remedy against the dangerous effects to which cattle are liable from too free feeding on clover, and some other vegetables of similar qualities.—It consists in a solution of ammonia, to be given in a quantity of water sufficient to enable the animal to swallow it with ease. One glass is generally found effectual. Should it be found otherwise, a second is to be given at the expiration of half an hour. Ample testimony is adduced to show the value of the prescription.

It has been asserted that a solution of potash, pearl-ash or a strong ley made by leaching ashes will answer the purpose of the above prescription.—*Editor N. E. Farmer.*

FISH USED AS A MANURE.

All the parts of fish—shell and all other—are excellent manures. They may be used, either salted or fresh; salted fish are generally considered the best. The heads of fish, and fish that are spoilt for eating, may be converted to this use; but they are most useful when used as an ingredient in compost. They are so strong a manure, that it has been said one single alewife will answer as a shovel-full of the best dung, in producing Indian corn. But they cause land to exert itself so much, that it will be apt to grow poor, unless care be taken to prevent it.

Onions for Sale.

Six hundred bushels of prime Onions (White Portugal, and Straw Coloured) raised by a gentleman in this vicinity, are offered for sale, to traders and others, by the bushel or barrel, on very advantageous terms. Enquire at the New England Farmer Seed Store. Aug 29

DISTRICT OF MASSACHUSETTS, to wit:

District Clerk's Office.

Be it remembered, That on the eighteenth day of July, A. D. 1828, in the fifty-third year of the Independence of the United States of America, J. B. Russell, of the said district, has deposited in this office the title of a book, the right whereof he claims as proprietor, in the words following, to wit:

"The New American Gardener; containing practical Directions on the Culture of Fruits and Vegetables; including Landscape and Ornamental Gardening, Grape Vines, Silk, Strawberries, &c. &c. By Thomas G. Fessenden, Editor of the New England Farmer."

God Almighty first planted a Garden; and indeed it is the purest of human pleasures—it is the greatest refreshment to the spirits of man; without which buildings and palaces are but gross handi-works.—*Bacon's Essays.*

In conformity to the act of Congress of the United States, entitled, "An Act for the encouragement of learnings, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies, during the times therein mentioned;" and also to an act, entitled, "An Act supplementary to an act, entitled, An Act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies during the times therein mentioned; and extending the benefits thereof to the arts—designing, engraving, and etching historical and other prints—JNO. W. DAVIS, Clerk of said District of Massachusetts.

Published every Friday / 35 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

No. 7.

AGRICULTURE.

From the Memoirs of the New York Board of Agriculture.

REMARKS

On cutting Oats and Laying Corn—stacking and applying Manures—Rotation of crops, &c.

By PHILEAS WALSH, of Westchester.

To JESSE BUEL, Esq.—Being honored with a circular from the Board of Agriculture, I will offer a few experiments which have proved to me of great advantage.

In the first place, every landholder who tills the ground should be very careful to provide and make manure by all possible means in his power; and this he may do to a considerable extent. He should provide himself with as much fodder as will winter more cattle than he can summer; and this is done in the following manner: Cut your oats when the straw is green in part; let them lay and cure in the swath until they are sufficiently dry not to mould; bind them in sheaves, and stack them. When they are threshed, the farmer will find that his oats will thresh to greater advantage. The light oats sticking to the straw, makes it good fodder, and I consider it of as much value as will pay the expense of raising the oats.

Secondly, give up the old method of cutting your top stalks; and when your corn is sufficiently hard, or when you cannot find an ear soft enough to boil and eat, then proceed to cut and stout your corn in the field, in the following manner: Bring the tops of two hills together, without cutting; bind them with a few spears of straw: then cut and set up about enough to make four sheaves, if bound; then put a band of straw about the top; and then you may add as many more, and bind the whole with two bands, always keeping the bottom of the stout open, so as to admit the circulation of air. At the proper time of gathering corn, you may proceed thus: Throw down the stout, unbind and begin to gather the corn; when you have stalks enough for a sheaf, bind them and lay it aside until you have enough for a stout. By this you save all the silk and small husks and under leaves of the corn, which were all lost by the former practice of topping and gathering corn. I will recommend that the stalks be stacked on a hovel, or poles laid on crotches, and foddered in the yard. I have been particular as to the time it takes in this process, and can say I am satisfied it takes no more time than in the old method.

The farmer should embrace every open spell in the winter to collect from his milking yard the scrapings, and also from the pond holes and hollows in his woods the leaves and dirt, and draw and spread them in his yard or yards. This will enable him to make, (by the help of twenty head of cattle) one hundred loads of manure, which will be fit to run on the ground the next autumn, at the rate of twenty loads to the acre, which, if ploughed in, and the land sowed with wheat or rye, and seeded with timothy seed at the same time, at the close of the next spring, it will produce a bumper crop of both crops, and in the

owner, and the ground in better condition than when first ploughed.

It may not be amiss to mention what kind of cattle a farmer can winter on such fodder as I have spoken of. I would recommend that he buy, in the fall, young heifers of good quality, and good looking young cows; and if his situation permits, a pair or two of steers, broken to the yoke; all of which are in demand in the spring, and will advance in price sufficient to pay for the wintering, and leave for his advantage a yard full of good manure. I will also recommend attention paid to the hog-pen, and as much litter, weeds, and refuse from the garden and yards, as can be procured, and by a careful mixture of some good black earth, the quantity of manure may be swelled to a large amount. As almost all landholders have on their farms ponds or swamps, that are dreary, I will recommend that they draw out, in the month of August, when most swamps are dry, a large quantity, and put it in a heap, and there let it lay until the next spring, when it will be fit to put on corn in the hill, and will have a very great effect. If after the operating of the frost on the heap, the compost should crumble, and have a proportion of dust, it is then good. If it should dry hard and lumpy, like clay, it is only fit to be put into the barn-yard or hog-pen, and be trodden in with the compost. By application of pond manures as above, I have been enabled to make some poor land become very productive.

As I have given some practical remarks on the making of manure, I shall now proceed to state my process of culture. I break the ground in the month of April, and have the sod turned under by one of Freeborn's ploughs, about eight inches deep; (and here it is that many make great blunders, and much to their disadvantage, by not attending in person, and having their ground ploughed deep and well;) and then harrowed with an iron tooth harrow, or wood will do, if it be heavy, and the teeth made of good hickory, and kept sharp. Harrow the same way you have ploughed, until you ground is well mellowed; then when you see the earliest apple-tree begin to drop its blossoms, furrow your ground three feet apart at right angles, and plant four grains of corn in a hill.

Almost every farmer has some method of steeping his corn before planting, and rolling it in either plaster, ashes, lime, or tar; all of which, at some times, are an advantage, and at other times a disadvantage. After my corn comes up, and is sufficiently large to be seen in rows, I commence ploughing and hoeing, and continue it until the corn begins to show signs of setting for ears, being partly done to keep the plough a-going in dry weather. By the above culture, I have been enabled to collect from fifty to eighty bushels per acre; and by mixing pumpkin seed, and planting it with the corn, I have raised four ox-cart loads to the acre.

I have already described my method of collecting and preserving the top and bottom stalks for fodder. I shall proceed to my next crop, the next spring, which shall be corn, and a proportion of potatoes; giving the preference to corn, on account of the great quantity of fodder. And this

year tilling, I break up the soil which laid last year beneath the furrow of the corn plough; thereby I am enabled again to raise a good crop of corn, and subdue all the wild grass roots and weeds which laid at the bottom of the furrow.— Third year, I split the corn hills with a plough, harrow the ground well, then plough, harrow again, and sow my oats and flax. My oats will produce about forty bushels, and upwards, per acre, depending on the season for their yielding; and my flax will average sixteen bushels of seed, and three hundred weight to the acre. I will observe, that where the ground is strong, and the oats very forward, they ought to be fed off to the ground, before they have a joint. This prevents their lodging, and gives the under oats an opportunity to come forward, which will much increase the quantity. The oat stubble and flax ground should soon be ploughed, harrowed and cross-ploughed; then draw on your manure, about twenty ox-cart loads to the acre; spread and plough it in as soon as possible. If you intend to sow rye put it in about the first of September, and sow your timothy seed after the harrow, eight quarts to the acre; then use a roller, which breaks the clods. It may be fed off during the fall, by calves, colts or sheep, without any disadvantage. If you intend it for wheat, sow it about the twenty-fifth of September, and follow the same method as with the rye; sow clover in the spring when the ground is open in cracks, about six pounds to the acre. By following the above directions, I have always realized a good crop of grain, and a great crop of grass; and the ground may and ought to remain in sod six years before ploughed again.

COCHINEAL.

It appears that an experiment lately tried in Spain, and in parts of the Mediterranean, to introduce the Cochineal insect, promises to be attended with the desired result in some of the provinces of Spain, as well as at Gibraltar, and at Malta. The Indian fig is of natural growth under the climate of those countries, and being the only food of the insect in question, originally suggested the idea of its importation. It has been ascertained that the powers of fecundity of the female cochineal insect are so great, as to enable it to give birth, in the very short course of its natural existence, to no less a number than 632,727.

AMERICAN LYCEUM.

This institution proposes a system of mutual instruction, fitted to the towns and villages in New England, and other parts of the country. The instruction is to be conducted at weekly or occasional meetings for reading, conversation, discussions, dissertations, illustrating the sciences, or other subjects of useful knowledge, or popular, practical education.

To aid these exercises, it is proposed to have each branch or town Lyceum, supplied with books, simple articles of apparatus for illustrating the sciences, and their application to the business of the farmer, mechanic, or civil engineer; also, specimens of Natural History, viz. Geology, Mineralogy, and if disposed, in Botany and Zoology.

This collection is to be made with reference to the various classes of society in a town, and deposited in some central place, where persons from all sections of the town, and of various pursuits and ages, can meet, according to arrangements made to accommodate the whole.

At one time, school teachers can meet, and discuss or illustrate subjects relating to their profession, and consequently for the benefit, not of themselves, but of their schools, and through them, for the benefit of the community and the world.

At the same or another time, misses and lads, young ladies and gentlemen, who frequently waste their time in schools with little children, or have passed the age for common school instruction, may meet, and receive in a weekly or semi-weekly course of exercises among themselves, or under the assistance of regular teachers, a clergyman, a lawyer, a physician, a farmer, a mechanic, a merchant, or any gentleman or lady competent and disposed to teach, instruction fitted to their age, pursuits and wants.

At the same place, and with the same opportunities, farmers can meet, to bring together their own views and experience, and compare them with those related by authors upon the subject of consideration, it having been adopted at a previous meeting. By the aid of apparatus and tests, the correctness of views or principles may, perhaps, be tried by actual experiment.

Mechanics can also make use of the same place, library, apparatus and specimens, to illustrate subjects, and prove or test principles, which they daily use, and a knowledge of which would increase both their satisfaction and success in their useful pursuits.

Societies of females, for literary or benevolent purposes, might improve the same opportunities, to give interest to their meetings, and greater efficiency and usefulness to their exercises.

Besides exercises fitted to the pursuits or the wants of particular classes of society, others of a more general or popular character may be introduced, such as popular lectures on the sciences, or any other subject of useful knowledge and common interest; and these either by a citizen or citizens, or by some one employed from abroad for the purpose.

To strengthen and facilitate the operations of the several branch Lyceums, all in a county are to be united by a Board of Delegates, who are to meet semi-annually, to adopt regulations, and forward measures for the general and mutual benefit of the whole. A County Lyceum is intended also to adopt measures for the benefit of schools in their district—to collect facts respecting their state and their wants, suggest improvements, and perhaps act as a Board of Examiners of school teachers in the county, and of course to take the place of town committees for that object.

Each County Lyceum in a State is to appoint one or more representatives, to meet perhaps during the session of their Legislature, to organize and adopt measures to advance the interests of education. A State Lyceum may act as a Board of Education; and by appointing committees for specific objects, viz. one to examine and recommend school books; another to determine upon the most essential branches in a system of popular education; the proportionate time and attention proper to devote to each; the order in which

they should be introduced, and the most efficient methods of inculcating them.

Not only the various subjects of instruction, but the different faculties of the mind, viz.—judgment, memory, temper and imagination, might justly come under the consideration of this or another committee. The object of such a committee would be to give both efficiency and symmetry to education.

From several State Lyceums a General Union might be formed, to be called the American Lyceum, and to perform the duties of an American Board of Education, in the most extensive sense of the word.

Under the patronage of the American Lyceum may be published a Journal, or the Journal of Education; small, familiar and practical treatises on the sciences; scientific, biographical, or historical tracts, &c. for the benefit of the various town lyceums, schools, workshops, taverns, steam boats and private families.

More than fifty societies upon this plan are already formed, and from the greater or less success which has uniformly attended their operations, and from the great increase of strength and efficiency which an extensive and GENERAL Union of the plan could not fail to give to individual efforts, it is most earnestly hoped that every town and village in New-England, at least, will take the subject into early and serious consideration, to determine whether they cannot, during the approaching autumn and winter, participate in spirit, and engage in the exercises, that they may enjoy the benefits of an institution designed for the diffusion of knowledge and the benefit of the world.

SILK.

FIRST AGE—THAT IS, UNTIL THE WORMS HAVE PASSED THEIR FIRST MOULTING, OR CHANGED THEIR FIRST SKIN. (Continued from our last.)

The apartment must be light, but the sun must not shine on the worms in any stage.

Feed the worms with the most tender leaves, four times a day, allowing six hours between each meal; give the smallest quantity for the first feeding, and gradually increase it at each meal between the moultings.

In about an hour and a half, the silk worms devour their portion of leaves, and then remain more or less quiet. Whenever food is given, widen the spaces for them: scattered food may be swept into its place.

Experiments may be made as to the comparative advantages of using chopped, or whole young leaves. If chopped, a sharp knife must be used, to prevent the leaves from being bruised, and thereby causing the exudation of water from them, which would prove injurious. On the fourth day the skin becomes of a hazle color and looks shining, their heads enlarge and assume a silvery bright appearance; these are marks of their approaching first change. Their food on this day, therefore, may be diminished, or when these appearances take place, but not before. Enlarge the spaces as the worms increase in size. The leaves ought to be gathered a few hours before they are used, that they may lose their sharpness: they keep very well in a cool cellar three days; the leaves ought to be gathered over night, for the morning's meal, to prevent the danger of collecting them in rainy weather. The leaves must be pulled carefully, and not bruised. On the

fourth day the appetites of the worms begin to decrease, preparatory to their first moulting, and their food must be diminished in proportion as the previous meal has not been completely eaten. If the precarious heat of the weather has been depended upon, the first change may not appear until the sixth or seventh day.

In the course of the fifth day all the worms become torpid; during this period, and in the subsequent moultings, they must on no account be disturbed. A few begin to revive at the close of the fifth day; some leaves may be then given. After the first moulting, the worms are of a dark ash color.

SECOND AGE.

As the worms are fond of the young twigs, some of these should be spread over them with the leaves attached, upon which the worms will immediately fasten, and they may then be removed to a clean paper; or lay a strip of chopped leaves near the worms, and they will leave the old food.

The litter is to be taken away; but as some of the worms often remain among the old leaves, they ought to be examined. To this end, the litter should be removed to another room, spread out on a table, and a few twigs placed over it, on which the worms, if any, will mount, when they may be added to the others; this rule must be attended to after every moulting. Ten per cent. is generally allowed for loss of young worms. The two first meals of the first day, should be less plentiful than the two last, and must consist of the most tender leaves; these must be continued for food until after the third moulting.

If between the moultings any worms should appear sick, and cease to eat, they must be removed to another room, where the air is pure and a little warmer than that they have left, put on clean paper, and some fresh leaves, chopped fine, given to them; they will soon recover, and then may be added to the others.

On the third day, the appetite of many worms will be visibly diminished; and in the course of it, many will become torpid—the next day all are torpid; on the fifth day they will all have changed their skins and will be roused.

The color of the worms in the second age becomes a light grey, the muzzle is white, and the hair hardly to be seen.

It must never be forgotten, that during the time the worms are occupied in moulting, the food should be greatly diminished, and no more given, than will satisfy those which have not yet become torpid on the first day—or those which have changed their skins before the others.

THIRD AGE.

During this age the thermometer must range between 71° and 73°. The revived worms are easily known by their new aspect. The latest worms should be placed apart, as their next moulting will be a day later also, or may be put in the hottest part of the room to hasten their growth. This rule must be observed in the next moulting; increase the spaces.

The second day, the two first meals are to be the least copious, the two last the greatest, because towards the close of the day, the worms grow very hungry. The third day will require about the same quantity as the preceding last meals; but on the fourth day, as the appetites of the worms sensibly diminish, not more than half

the former feed will be required. The first meal is to be the largest—feed those that will eat at any time of the day. The fifth day still less will suffice, as the greatest part are moulting; the sixth day they begin to rouse. Remove the litter, or even before they have moulted, if the worms are numerous.

FOURTH AGE.

The thermometer should range between 68° and 71°. If the weather be warm, and the glass rise several degrees higher, open the ventilators, exclude the sun, and make a slight blaze in the chimney, to cause a circulation of the air. Widely open the spaces for the worms. The leaves must now be regularly chopped in a straw-cutting box, or with a chopping knife. The food is to be greatly increased on the second, third, and fourth days. On the fifth, less will be required, as in the course of this day many become torpid; the first meal on this day should therefore be the largest. On the sixth, they will want still less, as nearly the whole will be occupied in effecting their last change of skin. Renew the air in the apartment by burning straw or shavings in the chimney, and open the ventilators. If the evenings be cool, after a hot day, admit the external air for an hour. None but full grown leaves should be hereafter given to the worms, and they must be all chopped; avoid the fruit, as they would prove injurious, and add greatly to the litter. On the seventh day, all the worms will have roused, and thus finish their fourth age. The litter must be again removed.

FIFTH AGE, OR UNTIL THE WORMS PREPARE TO MOUNT.

The thermometer should be about 68°. The constitution of the worms being now formed, they begin to elaborate the silk-vessels, and fill them with the silky material, which they decompose, and form from the mulberry leaves. Give abundance of room—do not let the worms lie so close as to touch one another, for their respiration will be thereby impeded; continue to feed regularly and fully, as the appetite of the worms now becomes voracious; give food rather five times a day than four; even six meals will not be too many. The last meal should be late at night, and the first the next day in the morning, at an early hour. The worms are not again to be moved, and the huddles or feeding frames must be cleaned. On the seventh day of the fifth age, they have attained their largest size, viz. three inches long, and begin to grow shining and yellow. The appetites of some diminish, but that of others continues, and must be supplied, to hasten their maturity. The litter must be removed every two days, during the fifth age, but not when the worms are moulting, unless it can be done without disturbing them.

The preservation of the proper temperature of the apartment at this stage, cannot be too seriously impressed upon the cultivator. If sudden and great heat in the weather should take place, (as often happens at this time) serious loss may be suffered, without proper precautions. The increased heat to which the worms are exposed, causes them to cease eating, to leave their feeding shelves, and to wander about the room, in order to find corners and places, to form their cocoons in before the silk fluid has been fully elaborated, or matured; thus defeating in a great measure all the care previously bestowed upon them. In

the summer of the year 1825, vast numbers of worms were killed by hot weather, in Mansfield, Connecticut. To guard against sudden heat in the weather, close the window shutters while the sun is beating on them, and keep the ventilators in the ceiling or other parts of the room open, and if possible, tubs of ice should be brought into the apartment, until the thermometer shows a diminution of temperature to the proper degree. The windows must also be kept open every evening and until sunrise next morning, and water sprinkled on the floor, to promote evaporation, and consequently a freshness in the air.*

HORTICULTURAL PETE.

The Tenth Anniversary of the Horticultural Society of this city was celebrated on Monday at Mr. Niblo's Garden. The exercises commenced at 3 o'clock, by an address from the President, Dr. Hosack. His discourse had more particular reference to the condition and prospects of the institution. He was followed by the Rev. Mr. Schroeder, who pronounced a finished oration, which was both pertinent and classical. Both the addresses were listened to with attention and interest by a numerous assemblage of ladies and gentlemen. At 4 o'clock the Society and their guests in number about 200, sat down to dinner at tables in Mr. Niblo's little Theatre, the Sans Souci—the pit of which had been floored over for the occasion. The stage was ornamented with the scenery of the establishment, the auditory with flags, green branches, and vases of flowers. Along the centre of the building stood the table containing the specimens of fruit of the season, grapes, peaches, plums, nectarines, &c. the contributions of the members of the Society. The display was a most beautiful one, comprising some of the very choicest and most tempting gifts of Pomona. Respecting the solids and substantial on the tables around these, to speak their praise it is amply sufficient to say that they were prepared under the direction of Mr. Niblo.

The following were the regular toasts:

1. The United States of America.
2. The President of the United States.
3. Horticulture, one of the most useful and elegant arts of Peace.
4. The Day. The Tenth Anniversary of our Society: the only strife amongst its members, is for the furtherance of its object.
5. Agriculture, Commerce and Manufactures.—We are too equally the debtors of each, to withhold from them equal protection.
6. The Navy and Army of the United States, the fruitful sources of contribution to our Horticultural products.
7. Our associate institutions throughout the world—indulging the same feelings in different climes.
8. The universal alliance of men for good purposes.
9. Our Sister Societies of London, Edinburgh and Paris.
10. American Gardeners; they know how to protect the soil they cultivate.
11. The memory of De Witt Clinton; the Patron and Honorary Member of this Society.

* If the worms should become diseased during the fourth or fifth ages, oak leaves may be given to them. These were stated to have been found very beneficial in the year 1772, in Bucks county—but the species of oak was not mentioned. The white oak may be tried.

12. The Orator of the Day.

13. The Fair Sex.

The toasts were interspersed with music by Mr Willis's band from West Point, which played several of the fine airs of Rossini and Weber, and with appropriate songs from some of the musical gentlemen of the company. Several excellent volunteer toasts were also given. The following will serve as a brief catalogue of the fruits displayed:

Grapes, by Mr. Armitage, of New York; four kinds, very superior, from Mrs. Griffith, of New Jersey.

Do. very fine, from Mrs. Saltus, N. Y.: six kinds, do. from Professor Gimbrede's vineyard, at West Point, very fine; do from Mr. Oakley, Greenwich Gages and Plums, from I. Dennistoun, Esq. Albany; do. from Jesse Buel, Esq. of a new and superior kind, to be named by the Society.

Pine Apples grown on this Island by Herman Thorne, Esq.; strawberries, by Mr. A. Parmentier; peaches, from Mrs. Van Nortwick, N. J.; do. J. Selby, Flushing; superior grapes from the garden of Dr. Hosack; fine peaches and grapes, from Philadelphia; white Holland plums, from F. Dennison, Esq. Albany; German gage, do.; Cherokee plums, Mr. Selby, Flushing; decorations of flowers, by Messrs Floy, Wilson, Hogg, and Cooke; superior nectarines, Mr. T. Ash; variety of melons; apples from Dutchess county; currant wine, from Mrs. Griffith, N. J.; wine, from Edenton, N. C.; creasy wine, six years old; catawba wine, from Dr. Mitchell.

The following are the Officers for the ensuing year:

For President, David Hosack, M. D.

Vice Presidents, John R. Murray, Jacob Lorillard, William Neilson.

Treasurer, John Groshon.

Corresponding Secretary, Abraham Halsey.

Recording Secretary, William R. Cooke.

Council.—N. H. Carter, John I. Palmer, Wm. Curr, Charles Henry Hall, Michael Floy, Israel Dean, Andrew Clark, Richard Hatfield, Alexander Smith, Francis Cooper, Wm. Fairbairn, Wm. M. Ireland, M. D. Andrew Parmentier, Michael Burnham, Thomas Kinnersly, Nicholas Saltus, Wm. Seaman, Thomas Hogg, Geo. Newbould, Wm. Neale, Charles Oakley, Wm. Wilson, Oliver M. Lownds, G. W. Arnold, Wm. Phelan, Gavin Yuill, Peter Hatrick, Samuel L. Mitchell, Peter Aymar, Isaac Adriance, James Mc Brair, Edward Probyn, Wm. M. Price, George Nixon.—N. Y. Statesman

Electrified Seeds and Plants.—By a series of experiments, M. Astier seems to have proved that when seeds or plants are electrified, they vegetate much more rapidly than in other circumstances. Some of his experiments were made on the monthly rose, (*Rosa Sinensis* and *R. Sempervirens*.) which, when submitted to electric influence, produced more early flowers, and in greater abundance.—It would be worth while to try what effects might thus be produced on flower seeds in the way of improving color, size, doubling, &c.

Safety guns are made at Birmingham so constructed as to be completely guarded against accidental explosion.

\$3,000 damages have been given in England by law, to an individual injured by a bag of wool falling upon him, which was thrown from an upper room of a warehouse.

DRAINS.

Drains used in farming are of two kinds, open and covered. Drains should be of a size and depth proportioned to the extent of the swamp and the probable quantity of water for which they are designed to be channels. They should generally be carried through the lowest and wettest part of the soil, although it should be necessary, in order to effect that purpose, to deviate from straight lines. Open drains sometimes answer the double purpose of conveying off superfluous water, and of inclosing fields. But they make a hazardous and inconvenient fence without the addition of a bank, hedge, or railing. The Farmer's Assistant says, "When a ditch is made for a fence, it ought to be four feet wide at the top, one or less at the bottom, and about two and an half deep; with the earth all thrown out on one side, and banked up as high as possible." Sir John Sinclair states, that, "It is a general rule regarding open drains, with a view of giving sufficient slope and stability to their sides, that the width at top should be three times as much as that which is necessary at the bottom, and in the case of peat mosses or soft soils, it should be such as to allow the water to run off without stagnation, but not with so rapid a motion as to injure the bottom."

But before you attempt to drain a piece of land, it will be well not only to calculate the cost, but to ascertain the nature of the soil which it is proposed to render fit for cultivation. If the subsoil or under layer be clay, the swamp may be worth draining, though there should be no more than six inches of black soil or mud over it, for the clay and the mud mixed will make a fertile soil. But if the subsoil or under stratum be gravel or white sand, it will not, in common cases, be best to undertake draining, unless the depth of black mud be as much as from fifteen to eighteen inches deep; for the soil will settle after draining, and be less deep than it was before. But the situation of the land to be drained may authorize some variation from these general rules.

The manner of draining a swamp is as follows: Beginning at the outlet, pass a large ditch through it, so as mostly to cut the lowest parts. Then make another ditch quite round it, near to the border, to cut off the springs which come from the upland, and to receive the water that runs down from the hills upon the surface, in great rains. These ditches should be larger or smaller, in some proportion to the size of the swamp, the shape and size of the hills which surround it, and other circumstances, which might tend to greater or less quantities of water being occasionally or generally led to the ditches. If the swamp be large, it may be necessary that some smaller cross drains should be cut in several of the lowest parts. The bottom of the main ditches, when the soil is not of an extraordinary depth, must be lower than the bottom of the loose soil; otherwise the soil will never become sufficiently dry and firm."

It is said by Sir John Sinclair, (Code of Agriculture, page 182,) that "in all drains, it is a rule to begin at the lowest place, and to work upwards, by which the water will always pass from the workmen, and point out the level. This enables the laborers also to work in coarse weather, and prevents their being interrupted by wet, so early in the season as otherwise might happen."

The mud and other materials, which are dug out of a ditch or drain, should not be suffered to lie in heaps or banks by the side of the ditch, but should be spread as equally as possible over the surface of the drained land. In this way, the matter taken from the ditches will tend to level the surface of the swamp—will, perhaps, serve in some measure for manure, and will not present any impediment to the passage of the water to the ditches. In some cases it may be advisable to transport the earth which is taken from the ditches, to the farm yard, or the hog pen, to form a part of that layer, which good farmers generally spread over those places in autumn, to imbibe liquid manure, or make into compost with dung. In many instances, we are told, that the earth thus dug out of ditches is thought to be worth enough to pay for the expense of digging the ditches.

STEALING FRUIT.

A young man employed in the factory in this town, on wages of \$5 per month, and his board, feeling rather frolicsome, went into a farmer's orchard, "just over the fence," and took three sweet apples—only three—and, moreover not very good ones. This was in the evening. There were ten or twelve young fellows with him, but he was the scape-goat; and it so happened that the farmer, having suffered before from such frolics, concluded to try titles to his fruit, at the first chance.—The young man was arrested, and was quite inclined to laugh it off; but it would not do. It seemed there was a law that if any person shall ENTER UPON any grass land, ORCHARD, or garden, without permission of the owner thereof, with intent to carry away any FRUIT, with the intent to injure or defraud such owner, he shall be fined not less than two, nor more than ten dollars; and shall be liable to be sued by the owner besides.—And if, having entered, he shall actually take any fruit, he shall be fined not less than five, nor more than fifty dollars, besides being liable to be sued for three times the value of what he takes. And if either of the above offences are committed on the Sabbath, or between sunset and sunrise, the penalties shall be doubled.

Finding this law very plain, and the magistrate finding the case very plain, the youth was fined ten dollars—being five dollars for the offence, and five dollars for committing it in the night. And then there was the expense of getting proof, &c. amounting to twelve dollars and some cents—say twenty two dollars and a half in all!!!—the wages of four months and an half. The unfortunate issue of the affair frightened the young friends of the transgressor, and he was left—in gaol!!!—a warning to all who are disposed to go out upon "hooking spruce." The way to keep out of such trouble is, to keep out of such orchards.

Springfield Journal.

EARTHQUAKES.

The philosophers of the present day concur in attributing earthquakes to a volcanic origin. In volcanoes we know there is an abundance of matter in a constant state of ignition, we know also that water thrown into a heated furnace will scatter the melted metal about in all directions; we have every reason therefore to conclude that if a quantity of water should be thrown upon the ignited matter in the bottom of a volcano, it would produce a mighty explosion, sufficient to shake the whole earth to a great distance. Earthquakes are

generally supposed to proceed from the explosions or occasioned by an influx of water upon ignited matter in volcanoes. In proof of this it is observed that they occur mostly in the immediate neighbourhood of volcanoes; the more remote they are the more feeble. It is known that volcanoes have usually some connection with the ocean, for they sometimes throw out water and marine animals of different kinds. How far the ignited matter extends under the sea in a horizontal direction from the crater we cannot tell, but doubtless it reaches to some distance as volcanoes occur in the vicinity of the ocean. The pressure of water 2 or 300 feet in depth is so immense, that we may easily suppose the rocks beneath to give way, so as to let a quantity of water into the volcano beneath, which will be followed by all the usual effects of the earthquake.—Scholar's Quarterly Journal.

IMPORTANCE OF KNOWLEDGE TO FARMERS.

1. The farmer ought to rise early, to see that others do so, and that both his example be followed, and his orders obeyed. 2. The whole farm should be regularly inspected, and not only every field examined, but every beast seen at least once a day. 3. In a considerable farm, it is of the utmost consequence to have hands specially appropriated for each of the most important departments of labour, for there is often a great loss of time, where persons are frequently changing their employments; and the work is not executed so well. 4. Every means should be thought of to diminish labour, or to increase its power. For instance, by proper arrangement five horses may do as much labour as six perform, according to the usual mode of employing them. 5. A farmer ought never to engage in a work, whether of ordinary practice, or intended improvement, except after the most careful inquiries; but when begun he ought to proceed in it with much attention and perseverance, until he has given it a fair trial. 6. It is a main object in management, not to attempt too much, and never to begin a work, without a probability of being able to finish it in due season. —7. Every Farmer should have a book for inserting all those useful hints, which are so frequently occurring in conversation, in books, and gathered in the course of his reading, or in a practical management of his farm.—Sinclair.

INHUMAN TRANSACTION.

A valuable fat ox, the property of A. F. Sawyer, of Mount Vernon, was, on Monday last, barbarously stabbed, by some malicious person, apparently with a pitchfork; the tines of which perforated his body in four places on each side, thro' the hide into the intestines. The wounds being adjudged such as must necessarily destroy the life of the ox, it was immediately slaughtered. Sufficient evidence being adduced on the spot to fix the suspicion on a person in the vicinity, he was arrested by Mr S. on an action of damage—and he will also doubtless be arraigned in behalf of the State, to substantiate his innocence, or answer for his guilt.—Amherst Courier.

LONDON MANURE.

Several vessels have arrived at Perth this spring from London with cargoes of manure. It is laid down at the quay, free of all charges, at from six shillings and six pence, to eight shillings per ton; this may be about one shilling, or one shilling and sixpence higher than the same quantity can be ob-

* See Deane's New England Farmer. Art. DRAIN.

ained in the neighbourhood, but the farmers say this difference is more than counterbalanced by the superior quality of the London article. There is sometimes difficulty in freighting a vessel, for this purpose, as the cargo is not only unpleasant but dangerous, as it keeps its level amidst the shiftings of the vessel; but the present state of the coasting trade obliges ship-owners to take strange cargoes.

SAFE AND CERTAIN.

To destroy nits and lice on Children's heads. Take a table spoonfull of black pepper, pound it fine, steep it moderately, for ten minutes in two thirds of a gill of N. E. Rum, rub the mixture on the head when going to bed and cover it with a cap or handkerchief.

By applying the above from one to three nights, will save parents much time and trouble.—*Kennebunk Gazette.*

Botany.—Recent microscopical observations afford some reason to suspect that the *conferva zonata* of Linnaeus, an aquatic production, the green colour of which has hitherto led to its being considered a plant, is endowed with animal life.

From the American Farmer.

HEDGES.

Mr. SKINNER.—In the 15th number of the current volume of the American Farmer, "A correspondent wishes to know which is the best kind of thorns for hedges?" &c. I have had some experience in that branch of improvement, and am willing to communicate it. I have planted three different kinds, namely: the Virginian thorn, raised in abundance, and sold by Mr. Joshua Pierce, at his nursery, Linnæan Hill, near Washington, from 1 to \$5 per thousand, according to the quantity purchased. The English white thorn, which I imported from Liverpool, cost with charges from 5 to \$6 per thousand, a native thorn found in my own neighborhood, and which I have seen in abundance in several places in this State and Pennsylvania; I know not the botanical name, but in a natural state, it grows large, of a circular formed top, with a dark green oval leaf, something resembling that of a pear tree, the thorn very long and sharp, the berries large and red. I have been told it is the same as the New Castle thorn; for the mode of raising the plants, see Mr. Mahon's Gardening. The first mentioned, I think makes the handsomest hedge; I prefer it for a garden or lawn; the second sends out a great many lateral branches, and makes a close compact fence; the third is of a most exuberant growth, and shoots out in all directions, perhaps the great objection will be the expense of keeping it in proper bounds; I have had shoots of one year's growth upwards of 6 feet long. I am of opinion that with proper management, a sufficient fence can be made of any of the three kinds in 4 or 5 years. I have also a hedge of the wild crab apple, that I think will answer the purpose and am now preparing to plant the honey locust, that I think may excel them all, but as yet cannot positively decide. My mode of planting is, after measuring the ground well, and planting potatoes on it, (which enriches and cleans it from weeds) I stretch two lines in the intended direction at a foot apart, and mark it off with a spade as deep as possible; then dig it out as deep as the good soil

goes; this I lay on the one side of the trench, and shovel out the sub-soil on the other side to the depth of 9 or 10 inches: this being done, let a careful hand go into the trench, and place the plants against each side of it at the distance of 8 or 9 inches, forming a double row 12 inches apart, and 8 or 9 distant in the rows * * * * having a smart boy to shovel in first the good earth, and then what came from below: care must be taken to fix the plants at the proper distance, and tramp the earth firmly about the roots. Before planting, I cut off all the straggling roots, and afterwards I ent the tops within an inch of the surface; after the first year, I again cut off about three inches from the ground; after the second, about twelve inches, and so on every year, letting them rise gradually, according to their vigor, till they come to a proper height; by these means I thicken my hedge at the bottom, otherwise it would be no fence, especially against the swinish multitude, that are always on the look out and ready for mischief. As to planting, I consider it immaterial, whether it be done in fall, winter or spring, if the ground be in good order; but if you have much to do, and defer it to the spring, there is a chance of the buds putting out before planting, which I would avoid if possible.

Probable Cost.

I estimate that the potato crop will pay for manuring and preparing the ground.

I suppose a good spademan, assisted by a boy, will plant 20 perches in a day—wages and victuals I value at \$1.

Suppose you plant at 8 inches distance in the row, it will require 50 plants to the perch—and suppose you value the plants at \$4 per thousand, the cost per perch will be as follows, viz:

50 plants at \$4 per thousand.	20 cts.
Expense of labor.	5
	ct., 25 per perch.

Protection from cattle and sheep will be necessary for 3 or 4 years. They should not be planted nearer any protecting fence than 3 ft. nor where too much shade of trees will reach them, nor should they be allowed to rise higher than about 5 feet at any time, for if they are allowed to shoot up, they will get thin at the bottom.

I am so well convinced of the efficacy and necessity of this species of improvement, that I am astonished at its being so little attended to, and I am still more astonished, that I never saw by any agricultural society, the least notice taken or encouragement given to it.

Yours respectfully,

C. BARNES.

Thornville, Taunton, 14th July, 1828.

The ship Alexander has just brought for Colonel Power, an extraordinary improved Durham short horn cow, which produced in England, as appears by certificate, 30 quarts of milk per day, in June last, and afforded from the milk of seven days 19½ pounds avoirdupois of butter, and had continued to give milk until the birth of her calf.

E. S. GARDNER.

Cheese.—Several reasons being suggested for cheese being sometimes poisonous. Another has occurred to the writer, from observing a number of thirsty cows drinking the "green mantle of the standing pool," in a pasture, for want of pure water.—*Palladium.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 5, 1828.

THE RASPBERRY.—*Rubus Idæus.*

In compliance with the request of a respected friend and correspondent, we give some notice of this shrub, and its cultivation.

Mr. Lowell, in the "*American Gardener*," page 136, says, "there are only two sorts of raspberries of any great value, the white Antwerp, and the red Antwerp. The cane, or smooth stalked, is also praised by some persons, but we have had no success with it; it seems to us to be our native raspberry."

London enumerates the following varieties: "early small white; large white; large red; most large red Antwerp; large yellow Antwerp; cane, or smooth stalked; twice bearing white; twice bearing red; smooth cane twice bearing."

Abercrombie gives the following for the culture of this shrub:

Propagation. The varieties can be perpetuated by young suckers, which rise plentifully from the root in spring and summer; when these have completed one season's growth, they are proper to detach with roots for planting, either in the autumn of the same year or the next spring, in February or March, but not later than the middle of April. These new plants will bear some fruit the first year, and furnish a succession of strong bottom shoots for full bearing the second season. New varieties are easily raised from seed—and they come into bearing the second year.

Soil and site.—All the varieties will succeed in any common mould, trenched about two feet deep, and sufficiently manured; but the soil in which the raspberry-bush most prospers and bears the finest fruit, is a light rich loam. Allet the main crop a free exposure to the sun, that the berries may ripen in perfection. Be careful to favor the twice-bearers with a dry soil, and a sheltered sunny situation, to give the second crop every aid in coming to maturity. When raspberries are cultivated on a large scale, it is best to keep them in plantations by themselves. Set these in rows from four to six feet apart, as the bushes are of the smaller or larger kinds, by three or four feet in the row. It suited bushes may either occupy a single row lengthwise along the back part of a border or end, in detached rows, at ten or fifteen feet distance. Soil and roots are frequently trained against walls, stakes, or spades, from the most sunny or the most shady aspect, for early and late fruit of improved growth and flavor. Neill says, "The raspberry-bush grows freely in any good garden soil, but it is the best for being slightly shaded. Although the place be covered by trees, and even slightly shaded the plant succeeds. In an open and well sheltered compartment, with rather a deep soil, containing a proportion of pebbles, we have seen very great crops of large and well flavored berries produced: for example, at Melrose House, the seat of the Earl of Eglinton, in the line."—Haynes also recommends well manured south, and a situation naturally or artificially shaded.

Age plantations.—Raspberries bear well in their prime about the third and fourth years, and, if well managed, continue in perfection five or six years; after which they are apt to decline in growth, and the fruit to become smaller; that a successive plantation should be provided in time

Select new plants from vigorous stools in full perfection as to bearing."

Summer culture.—"Keep them clear from weeds during the summer by hoeing between the rows; at the same time, loosen the earth about the plants. Under this management, the plants, if tolerably strong, will both yield a moderate crop the first summer, and supply young stems for bearing in greater plenty and perfection the following season: and so, from year to year, the summer culture should be repeated. As the plants get established, let all straggling suckers between the rows, or from the extreme roots of single stools, be cleared out by hoeing, or twisted off, to admit the air and sun freely to the fruit."

Pruning and winter dressing.—"It is requisite every winter or spring to cut out the dead stems, and to thin and regulate the successional young shoots. This annual pruning may be performed any time, during open weather, from November till the beginning of April. When kitchen-garden crops are cultivated between the rows, it is most convenient to do this as soon as the old bearers begin to decay. As to pruning indiscriminately in the open weather of winter, it sometimes happens that severe frosts immediately follow, and partially kill the plants: therefore it is safer to shorten the tender young stems early in spring; but let it not be done till the buds are making new shoots, as that would weaken the root. Cut out all the old dead stems clean to the bottom; and, having selected from the strongest young shoots on each main stool, three, four, or five, to be preserved for a succession of bearers, cut away the superabundant close to the ground. Let each of the shoots retained be pruned at top, below the weak, bending part; cutting in the smaller plants, to about three or four feet in length, and in the large sorts, to the length of five or six feet. If any of the stems diverge irregularly, or straggle much asunder, they may be tied together at top, and thus the strong ones will support each other; or the taller varieties may have the support of stakes. Prime plants against a wall or trellis as above; and train the shoots to rise a little diagonally. After pruning, having cleared away the cuttings, dig the ground between and about the plants. To turn in a little rich compost every year will conduce to plentiful and fine returns; lay it at the extremities of the roots, and deeper as the plantation gets older. Eradicate all straggling suckers."

To obtain fruit of a very large size.—"The fruit of the raspberry may be obtained of a very large size, other circumstances being of the most favorable kind, by destroying all the suckers; but in this way, the plant being destroyed, a double plantation is wanted, one to grow only suckers, and the other fruit. In this way Reicht, at Berlin, produces plants ten and twelve feet high, with fruit larger than any we have seen in this country.—(*Versuch den Weinbau, &c.* p. 46.)

Taking the crop.—"The fruit of the different varieties comes in from the end of June or July till October or later. As it ripens, it should be timely gathered for immediate use; because, when fully ripe, it will not keep above two or three days before it rots, or becomes maggoty, and unfit to be used."—(*ibid.*)

Raspberries may be forced equally well with gooseberries and currants, and, like them, either planted in pots or in the soil or floor of the house. In M. Hope's garden at Hackney, the raspberry

is planted outside along the north and south sides of a pit; the shoots of the preceding year are introduced under a glass and trained to a trellis, and forced while the suckers are left to grow upright in the open air.

ADVANTAGES TO BE DERIVED FROM AGRICULTURE.

The celebrated Watson, Bishop of Landaff, in a communication to the British Board of Agriculture, has the following passage.

"The agricultural improvements which have hitherto taken place amongst us, have been by the expenditure of private wealth; but the country cannot be brought to that proportion of cultivation, of which it is capable, unless individual efforts are aided and accelerated, by public wisdom and munificence. I boast not of any particular patriotism, but I would willingly pay my share of twenty or thirty millions of public money, to be appropriated by the Legislature, to the agricultural improvement of Great Britain and Ireland. This appears to me to be an object of far greater concern to our independence as a nation, than any extension of commerce or any acquisition of distant territory ever can be. If the time should fully come when an unproductive acre of land could not be found in either of these, our *fortunate islands*, we shall then have food within ourselves, for the annual sustenance of at least thirty millions of people, and with a population of thirty millions, what power in Europe, or what combination of powers will dare to attempt our subjugation."

SELECT SEED CORN.

It is highly important that your seed corn should be selected from the best samples which can be obtained, as the offspring whether vegetable or animal will in a great degree partake of the good or bad qualities of the parent. The following directions on this subject are from a scientific and practical agriculturist:

"When the first ears are ripe enough for seed, gather a sufficient quantity for early corn or replanting; and at the time you would wish your corn to be ripe, generally, gather a sufficient quantity for planting the next year, having particular care to take it from stalks that are large at bottom, of a regular taper, not over tall, the ears set low, and containing the greatest number of good sizeable ears of the best quality; let it dry speedily; and from the corn gathered as last described, plant your main crop, and if any hills should be missing, replant from that first gathered, which will cause the crop to ripen more regularly than is common, which is a great benefit.—The above mentioned I have practised many years, and am satisfied it has increased the quantity, and improved the quality of my crops beyond what any person would imagine, who has not tried the experiment."

Dr Deane observed that "some recommend gathering seed corn before the time of harvest, being the ears that first ripen. But I think it would be better to mark them and let them remain on the stalks, till they become sapless.—Whenever they are taken in, they should be hung up by the husks, in a dry place, secure from early frost; and they will be so hardened as to be in no danger of injury from the frost in winter."

The donations and subscriptions for the Thames Tunnel, up to our last dates, amounted to upwards of \$12,000.

GOOD FOOD FOR MILCH COWS.

Beat up in a mortar dry corn cobs, pour boiling water over them, or boil them in a pot, stir them frequently when boiling, and when cold give it to your cows.

TO CAUSE NEW BARK TO GROW ON OLD TREES.

Scrape off the loose bark, and apply a mixture of cow dung and urine made into the consistence of paint. Apply this composition with a painter's brush, covering the stem carefully over. This softens the old scaly bark, which peels off the following winter and spring, and is succeeded by firm, smooth new bark.—*Repertory of Arts*, vol. iv. page 76.

HORTICULTURE.

The Editor of the New Bedford Courier in that paper of the 12th ult. has given a friendly and favourable notice of the *NEW AMERICAN GARDENER*, recently published at this office; and closes his remarks with the following just and well expressed observations on the importance of the "subject to which it is devoted:"

"We rejoice in the increasing attention which is given to the improvement of Horticulture in New-England. Let us imitate, in this respect at least, the noble example set us by our parent country. Travellers who visit England find nothing which calls forth their enthusiastic encomiums more than the taste and skill with which her country residences are adorned by the hand of successful cultivation. Almost every field is a paradise, we are told, in the ardent and somewhat extravagant language of their praise. Our gardens have been comparatively neglected. With a few exceptions, and those principally in the vicinity of our State capital, there have not been many enclosures heretofore in this part of the country, which an Englishman of taste, familiar with the state of cultivation at home, would consent to honour with the name of a garden. But what is there to prevent the gardens of New-England from attaining, with proper attention to cultivate and diffuse a correct taste in horticulture, the beauty and elegance so highly extolled in English gardens? To come still nearer home: though those who live in towns cannot all be farmers, they may all of them, in a town not more compactly built than ours, to a limited extent be Horticulturists. No man is aware, till he has tried the experiment, how much, by judicious arrangement, can be made to grow on a quarter of an acre of ground, or even on a smaller quantity; how many of those fruits, vegetables, and flowers, the best methods of rearing which are pointed out in the book before us, may be cultivated to advantage in his little garden. The rapid improvements of our gardens and grounds within a few years, shows that we have learned something of the powers of cultivation, that we are in some measure aware of what skill and taste can accomplish. But we have much yet to learn and to do. Let us profit from the experience of others, while improving and beautifying, each one his little domain. The studious and sedentary man will find in this employment a relaxation at the same time both of body and mind; and while the face of external nature grows daily more beautiful beneath his forming hand, the healthful and invigorating exercise imparts a kindred beauty to the intelligent spirit within that plans and directs its operations, and both alike conspire to promote his being's end and aim."

PARSNEPS.

Cause cows to give abundance of milk, and they eat them as freely as they do oil cake. In giving an account of the agriculture of the island of Jersey, an English writer says "Parsneps are grown by every farmer, and either by the spade culture alone, by the plough and spade, or by the small and great plough: any soil in good heart and tith suits them, but peculiarly a deep loam; and in the same spot, generally, are raised beans, peas, cabbage, and, occasionally potatoes.

"When the ploughing or digging is completed, the field is once harrowed; straight lines are then drawn across, by means of a gardener's rake, usually from north to south; women then proceed with dibbles, and set the beans in rows, at a distance of four inches, or five inches, from bean to bean, in four, three, and sometimes two ranks of beans, leaving intervals of between five and six feet between each of the sown rows. In the use of the dibble, and in dropping the beans, the women have acquired considerable dexterity. In many instances they are followed by children, who drop in each hole made by the dibble, after the bean, three or four peas; the parsnep seed is then sown at the rate of one third to one half a bushel to the acre.—*Quayle's General View of the Norman Islands.*

Use.—The writer above quoted asserts, that, in the island of Jersey, parsnep "is eaten with meat, with milk, and with butter; but not, as in the common mode of using it as human food in England, with salt fish, or, as in Ireland, together with potatoes.

"The next most valuable application of this root is hog-feeding. At first it is given to the animal in a raw state, afterwards boiled or steamed, and finally, for a week or fortnight, with bean and oatmeal. A hog treated in this way is sufficiently fattened for killing in about six weeks. Its flesh is held superior to that arising from any other food, and does not waste in boiling.

"Bullocks are also fattened with parsneps in about three months; their flesh is here considered of superior flavor to any other beef, and commands, on that account, an additional half-penny in the pound on the price. To milch cows they are also usually given; on this diet, the cream assumes a yellow colour. By the accounts here given, it appears, in proportion to the milk, to be more abundant, than when the animal is kept on any other food whatever. When the cow receives at the rate of thirty-five pounds per day, with hay, seven quarts, ale measure, of the milk produce seventeen ounces of butter. It is generally allowed that the flavor of the butter is superior to any other produced in winter.

"Geese are sometimes shut up with the hogs to fatten on parsneps, which they will eat raw.—The root is also given boiled; and for a week before killing they are fed with oats or barley only. Horses eat this root greedily; but in this island it is never given them, as it is alleged that, fed on this food, their eyes are injured. About Morlais, horses are not only ordinarily fed on parsneps, but they are considered as the best of all food, superior even to oats."

At a meeting in London, at which the Duke of Wellington presided, it was agreed to open a subscription to complete the Thames Tunnel. 27,000 dollars were subscribed the same evening. The Duke said the sub-marine road would be completed if funds could be raised.

TO PICKLE GIRKIN CUCUMBERS.

As inquiries are frequently made here on the best mode of pickling the Girkin cucumber, lately introduced, we have solicited and obtained the following recipe from a gentleman of this city, who has been eminently successful with them:

"MR RUSSELL—I enclose you the recipe for pickling the fine and delicate Girkin cucumbers, which I have raised two seasons, from seed purchased at the New England Farmer office. Put them in a brass kettle, with strong salt and water,—cover them with cabbage leaves, and keep them in a gentle heat near the kitchen fire,—change the water three times every other day,—drain them in a basket,—put them in pots, and pour boiling vinegar on them. In a few days, as the vinegar soaks up, fill the pots with very sharp boiling vinegar. In this way I have kept them in the finest order till they were all used, a few days since.

Yours truly,

J. G. J.

While on this subject, we would remark that the Girkin cucumber being a tropical plant, (from St Domingo) requires that its seeds should be forced in hot beds to make them vegetate and start vigorously, or not planted in the open air till July, when the earth has acquired a sufficient degree of heat. They bear abundantly; and should be gathered when young, when about the size of walnuts.

Bleaching Salts.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, a further supply of Bleaching Salts, or chloride of Lime, an account of which may be seen by referring to page 401 of the sixth vol. of the New England Farmer.

New England Farmer.

The subscriber wants to purchase a complete set of the New England Farmer. E. STEDMAN.
Newburyport, Sept. 3.

Seeds for Fall Sowing.

For sale at the New England Farmer Seed Store, a fresh supply of various Grass Seed—also a great variety of vegetable seeds for fall sowing, viz. White Portugal Onion, Strasburg do. Silver skin do. Prickly Spinach and Dutch Cole for early greens—various kinds of lettuce, carrot, cucumber, cabbages, &c.—black Spanish or winter radish, &c. all warranted fresh.

Orchard Grass Seed—growth of 1828.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, 20 bushels of prime Orchard Grass Seed, raised, this season, with the greatest care, by John Prince, Esq.—warranted to be equal in purity to any ever offered for sale in New England. A supply of pure Gilman Wheat, raised by Payson Williams and Mr Winchester, is daily expected.

For Sale.

A Bull Calf five weeks old of the Short Horn breed, from the best imported Stock, both Sire and Dam, well known and highly approved. Apply at this Office for price and particulars of pedigree. 41. August 20, 1828.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D." Boston, through the post-office. 61. Aug. 1

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, a sorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Onions for Sale.

Six hundred bushels of prime Onions, (White Portugal and Straw Coloured) raised by a gentleman in this vicinity, are offered for sale, to traders and others, by the bushel or barrel, on very advantageous terms. Enquire at the New England Farmer Seed Store. Aug 26

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordeaux, Clerac, and Bazet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1828.

Mr A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities, where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 100; and 13 cents for less than 50 roots.—Payment to be made on delivery of the roots.—Letters not received rules, post paid.

Subscription lists are open at New York, with Alphonse Loubat, 35 Wall street—Boston, E. Copeland, Jr.—Albany, R. M. Michael—Philadelphia, Van Amringe—Baltimore, Willard Rhoads—Washington City, Wm. Patro—Richmond, Davenport, Allen & Co.—Savannah, Hall, Shapter & Turner—New Orleans, Foster & Hutton—Charleston, (S. C.) J. & J. Street & Co. Mr A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal book sellers of the United States; and his agents will furnish them gratis to subscribers.

MISCELLANIES.

FOR THE NEW ENGLAND FARMER.

The criteria of a beautiful cow, according to Wilkinson, may be thus expressed.

She's long in her face, she's fine in her horn,
She'll quickly get fat, without cake or corn,
She's clear in her jaws, and full in her chin,
She's heavy in flank, and wide in her loin.

She's broad in her ribs, and long in her rump,
A strait and flat back, with never a hump;
She's wide in her hips, and calm in her eyes,
She's fine in her shoulders, and thin in her thighs.

She's light in her neck, and small in her tail,
She's wide in her breast, and good at the pail,
She's fine in her bone, and silky of skin,
She's a Grazier's without, and a Butcher's within.

TROUT FISHING.

The following apostrophe taken from a poem ascribed to Dr. WATCOTT, proves him to have been no friend to piscatory amusements.

Why fliest thou away with fear?
Trust me, there's nought of danger near;
I have no wicked hook,
All covered with a staring bait,
Alas! to tempt thee to thy fate,
And drag thee from the brood.

Oh! harmless tenant of the flood,
I do not wish to spill thy blood—
For nature unto thee.

Perhaps, hath given a tender wife,
And children dear, to sweeten life,
As it hath done to me.

Enjoy thy stream, then, harmless fish,
And, when an angler, for his dish,
Through glutteny—Ade sin!
Attempts, a wretch! to pull thee out,
Heaven give the strength, O, gentle trout,
To pull the rascal in!

Cracking a Nut.—Two Ducks, who were sitting over a pint of wine, made up for the deficiency of port by the liveliness of their wit. After many jokes had passed, one of them took up a nut, and holding it to his friend, "If this nut could speak what would it say?" "Why," rejoined the other, "it would say, give me none of your jaw."

The indulgent parent, who takes pleasure in giving a child, after the age of eighteen months, all he craves, "should be reprimanded," says a celebrated physician, "as a directing post in a cross-road, with three indexes, one pointing to an ignominious death, one to a lunatic asylum, and the other to poverty and distress."

Massé's Foot.—The following circumstance is a striking illustration of the utter recklessness of feeling in relation to all that is endearing to human nature, which a state of slavery produces in the bosom of its victims:

A negro in Kentucky, not long since, had accidentally suffered a wound on his foot, which was likely to prove fatal, through want of cure. A person of kindly nature, who he did not mind, happened to be near him. He felt no pity for him, but said, "I will cure you, if you will, but you must give me your foot." "I will give you my foot," said the negro, "but you must give me my foot."

Courtship.—A gentleman, feeling a strong partiality for a young lady whose name was Mary, was desirous, without the ceremony of a proposal,

courtship, to ascertain her sentiments. For this purpose he said to her one day—with that kind of air and manner which means either jest or earnestness, as you choose to take it—"If I were to ask you whether you are under matrimonial engagements to any one, which part of your name (No-yes) might I take for an answer?"

"The first!" said she in the same tone.

"And if I were to ask if you were inclined to form such an engagement, should a person offer who loved you, and was not indifferent to your self; what part of your name might I then take as an answer?"

"The last."

"And if I tell you that I love you, and ask you to form such an engagement with me; then what part of your name may I take?"

"Oh then," replied the blushing girl, "take the whole name, as in such a case I would cheerfully resign it for yours."—[Alb. Chron.]

Horticulture in an enlarged view.—At the annual treat of the Horticultural Society at Cheswick, England, there was a fine display and hearty consumption of veal, hams, chickens, jellies, coffee, tea, hock, claret, campaign, sherry, port—pines, peaches, cherries, grapes, melons, and strawberries. The horticultural part was very small. The best pines were from the garden of Lord Ellenborough. It seemed to be generally agreed that much of the fruit had been cultivated away from its rich natural flavor. At a horticultural treat there should be nothing but garden fruits, unless you choose to consider every thing as coming from the earth, as the food for the animals, and the grapes for the wine, &c. But then the bee must be excepted.

To whom it may concern.—It is surprising how lightly the obligations of strict honesty seem to set upon many persons who would fain be considered very good men. If they wish to sell an article, they appear to suppose that an erroneous statement concerning it, or at least a concealment of its defects, is perfectly admissible; and when the bargain is completed and the writings signed, if the purchaser remonstrates, they will laugh at him to his face. If they have incurred an honest debt, which by some quirk of the law it is possible to evade, they will postpone it and postpone it, and probably never pay it at all. If a mistake has occurred in their favor, they will never rectify it.—Nay, there are men who profess better things, whom if you entrust with the collection of monies or other confidential business, it is extremely doubtful whether the proper returns will ever be made, unless you pursue them continually with the glance of your eye. In short, we believe there are some pious men, who have formed such habits of carelessness and negligence, that the less you have to do with them the better.

We mention these things, not because we have suffered more from dishonesty than many others; but because we view its opposite as a part of Christian morality. A dishonest Christian is a contradiction in terms. And we are anxious to impress it upon our readers, and also upon ourselves, that in all pecuniary transactions, if we promise to do and we do, or if we are bound by the law, it is done at the peril of our souls. We are associated with another man's business, not because it is profitable, but because it is a duty. We are bound to do it, and we are bound to do it at the peril of our souls.

not a flagrant breach of the law of love, and expose ourselves to the indignation of Heaven.

This parleying with temptation is a dangerous thing. The man who would approach as nearly as possible to the bounds of positive dishonesty, will do well to take heed lest he die in the State Prison or on the Gallows.—N. Y. Observer.

Spontaneous combustion.—The Virginia Free Press relates an instance of spontaneous combustion in a spit-box which had been filled with saw dust. The room in which it was placed was found full of smoke, and the bottom of the box was burnt through. It was satisfactorily ascertained that not a spark of fire had been in the room. This incident may account for the burning of saw-mills and carpenter's shops, where moist saw-dust has been swept into a heap.

The canvass cover of a cart at Mount Pleasant, Virginia, which had been newly painted, afterwards wet by a shower and rolled up, took fire recently and was almost entirely consumed, making a hole likewise through the bottom of the cart.

The Kurbut, or Great Flower of Sumatra, discovered by Dr Arnott, in 1818, is one of the most extraordinary of vegetable productions. It is a parasite, growing out of another plant, in the manner of the mistletoe, and is found in woods, on the roots and stems of those immense climbers which are attached, like cables, to the largest trees in the forest. The flower constitutes the whole of the plant, there being neither leaves, roots, nor a stem. The breadth of a full grown flower exceeds three feet; the petals, which are subrotund, measure twelve inches from the base to the apex; what is considered the nectarium would hold twelve pints; the pistils, which are abortive, are as large as cows' horns; and the weight of the whole is about fifteen pounds. The flower fully blown, was discovered in a jungle, growing close to the ground, under the bushes, with a swarm of flies hovering over the nectary and apparently laying their eggs in its substance. The color of the five petals is a brick red, covered with protuberances of a yellowish white. The smell is that of tainted beef.—*Magazine of Natural History.*

Some of the Glovers in England have presented a petition against the importation of Gloves.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturalists in the vicinity of Boston and New York, is just published by J. B. RUSSELL, Proprietor of the New England Farmer. The articles are arranged alphabetically, and comprise the most useful VEGETABLES and FRUITS which can be conveniently and economically cultivated in the climate of New England and the Middle States; as well as a Treatise on FLOWERS, and on LANDSCAPE or PICTURESCAPE GARDENS, on the general management of the SILK WORM, and the manufacture of SILK, and a Treatise on the culture of GRAPE VINES and the STRAWBERRY. The article on Fruit Trees contains an enumeration and description of all the Apples, Peaches, Cherries, Plums, Nectarines, Apricots, &c. &c. that can be raised to the most advantage, and their relative hardiness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is illustrated by gentlemen practically acquainted with the subject, on which they have written.

A list of the contents of the work will be found in the New England Farmer for August 1.

Price \$1.50—Sent by mail for 20 00

Published by J. B. Russell, at 54 N. Market Street, New York, payable at the end of the year, but those who order within sixty days from the date of publication will be sent by mail for 20 00.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VII.

BOSTON, FRIDAY, SEPTEMBER 12, 1828.

No. 8.

AGRICULTURE.

Flemish husbandry.—The Flemings, or inhabitants of Flanders, in the kingdom of the Netherlands, are celebrated for frugality and economy in farming, and for judicious modes of culture. A late traveller says: "The country is a positive garden, and presents a most luxuriant appearance; the fields are streaked with all the colors of the rainbow. You will see, belonging to the same proprietor, fine green pastures, new mown hay, bright yellow coltsseed, pink and white clover, light blue flax, rye, wheat, barley, oats, and large plots of crimson poppies."

Coltsseed (or rapeseed) is extensively cultivated in Flanders, France, England, &c. for the production of oil, and some agriculturists consider it one of the most profitable crops in husbandry. The produce on good land, in favorable seasons, is from 40 to 50 bushels per acre. The seed is sold for crushing, or is crushed by the farmer himself; an oil mill being a common appendage to a farmery in some districts. Four gallons of seed yield one gallon of oil. The straw is eaten by cattle. We believe that much of the oil imported into the United States from Europe, and sold here as linseed oil, is the produce of the rape or coltsseed.

The *poppy* is cultivated on the continent of Europe as an oil plant, and the oil is esteemed in domestic economy next to that of the olive, being used for salad oil. The seed is sown at the rate of one gallon to the acre, and the average produce on rich soil is about 30 bushels per acre.—Five gallons of seed yield one gallon of oil. The poppy is harvested by shaking out the seed upon sheets laid along the rows.—*Hamp. Gazette.*

TO AGRICULTURISTS.

It has been stated to us, that, some eighteen months ago, a gentleman of this state, feeling desirous to ascertain whether certain productions of France would thrive in New-England, sent to that country for a variety of fruit trees. Choice varieties, consisting of apricots, quinces, nectarines, peaches, apples, pears, cherries and plums, were accordingly removed, in January, 1827, and shipped to New-York, where they were landed in March following. In the month of April, the gentleman planted these trees upon his farm in the neighbouring town of Northford; and in October of the same year, many of them produced perfect fruit. We are gratified to learn that at the present season these thrifty trans-Atlantics appear healthful and promising.—*New-Haven Journal.*

IRON.

Since the enactment of the tariff bill last winter it has become a desideratum to ascertain the probable quantity of iron manufactured in the United States, and particularly in Pennsylvania. As there is much diversity of opinion on the subject, we have contributed our mite to ascertain the quantity of iron manufactured in Schuylkill county.—The statistics of the United States, in this most essential branch of manufacture, is of importance, because we verily believe, the supply of the country is abundantly sufficient for its consumption.

The iron works in Schuylkill county are Greenwood Furnace and Forge; the Schuylkill, Bruns-

wick, and Pinegrove Forges, besides two new forges which are now being built, one at Mahanoy, and the other at Swagura. Five hundred tons of bar iron may be made by these four furnaces now in operation annually. Greenwood works are owned by Messrs. John and Benjamin Pott, who carry them on extensively and we believe profitably. They are the only persons engaged in the business of these works. The ore for their furnace is obtained from the neighborhood of Pottsgrove and Reading, and is transported to the furnace on the canal. The price of bar iron is \$40 per ton at their forge. The price of pig is \$23 per ton at the furnace, of which twenty tons a week can be melted.—*Miner's Journal.*

Peach pie.—The season of peaches having arrived, we again publish the recipe for the best fruit pie that can be made. Place your paste in a deep plate, as for other pies—then, having wiped your peaches with a cloth, put them in *whole*, and spread upon them sugar sufficient to sweeten them well, then cover close with paste and bake till the fruit is sufficiently cooked. The stones of the peaches are sufficient without any other seasoning, and are better than any other. If the fruit is good, there will be so much of the juice on opening, that it will be necessary to serve with a spoon.

From the New American Gardener.

LOCUST-TREE.—*Robinia pseudo-acacia.*

This tree is a native of the United States.

Method of cultivation.—"It is capable of being raised from the seed, cuttings, layers and suckers; but the seed method is said to afford the best plants. The seeds should be sown about the end of March, or beginning of the following month, on a bed of light mould, being covered to the depth of about half an inch. The plants usually appear in the course of six or eight weeks. They should be well weeded and watered, and, when sufficiently strong, should be set out in the spring or autumn, in nursery rows, for two or three years, in order to remain to have a proper growth for final planting."—*Rees' Cyclopaedia.*

Dr. Drown, of Rhode-Island, says, that "The easiest method of raising the locust is as follows: Plant fifteen or twenty trees on an acre, and, when fifteen or twenty feet high, run straggling furrows through the ground, and, wherever the roots are cut with the plough, new trees will start up, and will soon stock the ground with a plentiful growth."

Use.—It is observed in the *North American Sylva*, a celebrated work, by F. Andrew Michaux, that "The greatest consumption of locust wood is for posts, which are employed in preference for the enclosing of court-yards, gardens and farms, in the districts where the tree abounds, and the circumjacent country. They are transported for the same use to Lancaster, Baltimore, Washington, Alexandria, and the vicinity. When the trees are felled in the winter, while the circulation of the sap is suspended, and these posts are allowed to become perfectly dry before they are set, they are estimated to last forty years. Experience has shown that their duration varies according to cer-

tain differences in the trees from which they are formed: those about Lancaster, and at Harrisburgh, a small town on the Susquehanna, where a considerable trade is carried on in wood that is brought down the river, those trees are reputed the best whose heart is red; the next in esteem are those with a greenish-yellow heart; and the least valuable are those with a white heart. From this variety in the colour of the wood, which, probably, arises from a difference of soil, are derived the names of *red*, *green*, and *white* locust. In the Western States, there is a variety which is sometimes called *black* locust."

It is probable, that the locust with a "greenish yellow heart," spoken of by M. Michaux, is the same with that which Mr. Briggs calls the *yellow* locust; and although M. Michaux supposes "this variety in the color of the wood probably arises from a difference of soil," it is not impossible that there may be permanent specific differences in the several varieties. If so, the discovery is of importance.

M. Michaux says, "In naval architecture, the shipwrights use as much locust-wood as they can procure. It is as durable as the live oak and the red cedar, with the advantage of being stronger than the one, and lighter than the other."

With regard to the insect which destroys the locust, M. Michaux says, "Within eighteen or twenty years, an obstacle has unhappily appeared, which will contribute greatly to prevent the multiplication of the locust in all the anciently settled parts of the United States: this is a winged insect, which attacks the tree while standing, penetrates through the bark into the centre of the trunk, and, for the space of a foot, mines it in every direction, so that it is easily broken by the wind. This inconvenience is already so serious, as to induce many people to forego all attempts to form plantations of locust. In Virginia, I have not learned that trees of the natural growth have been visited by this destroyer, but those that have been reared about the plantations have already felt its ravages. This evil, which it appears difficult to remedy, will be more sensibly felt when the destruction of the forests now on foot, an inevitable consequence of the neglect of all measures of preservation, shall force the inhabitants to have recourse to plantations, which they will wish to form, in a certain proportion, of the locust.—Hence it may result, that, disappearing successively from the American coasts by constant consumption, and not being reproduced on account of the insect, the locusts will become extremely rare in their native country, and abundant in Europe, where no similar catastrophe forbids their propagation."

The *Massachusetts Society for the Promotion of Agriculture* have offered a premium of fifty dollars "for a mode of extirpating the worm that attacks the locust-tree, which shall appear to the satisfaction of the trustees to be effectual."

The following, copied from a report of a committee of the *Essex Agricultural Society*, on farms in Essex county, Mass., (published in the *N. E. Farmer*, vol. iii. p. 145.) places the advantages to be anticipated from the culture of the locust in a fair, and, we believe, just point of view.

"A practical illustration of the advantages of cultivating the locust tree presented itself on the farm of Dr. Nichols. Several acres, that were, a few years since, barren and gravelly pastures, are now covered with a good coat of grass, almost entirely by reason of planting and permitting a growth of locust trees upon the land. This is easily done, after a few trees have taken root, either from the seed, or by being transplanted, and taking care that horned cattle do not go upon the land while the trees are young. In addition to the increase of feed, the trees themselves are well worthy of cultivation. No growth is more rapid, and none more in demand, or of greater value when arrived at maturity. It may be doubted whether an acre of land can be made to yield more in the course of twenty-five or thirty years, without the application of any manure, than by planting it with locust-trees. On a fair computation, the number of serviceable posts that might be obtained in this time would be from three to six hundred, worth from fifty cents to one dollar each. The increase of feed and surplus wood would fully pay the labor of cultivation; so that the proceeds of the timber would be the profits of the land.

"An objection to the cultivation of the locust-tree is often brought from the fact that they are sometimes destroyed by worms. This is true; but the ravages of this insect are found to be greatest where the trees are few and scattered. In the grove on this farm, which extends over a number of acres, and in the other groves in the vicinity, but very few of the trees are at all injured by worms. This objection is by no means sufficient to authorize the neglect of their cultivation. It certainly is of the highest importance to the farmers of Essex, to inquire how they can improve their pastures; or, rather, how they can save them from ruin; for it must be obvious to all that, as at present managed, they are constantly growing worse, and many of them have already become of very little value. If, by planting them with trees, by ploughing, by applying plaster, &c. has been done, with good success, on the farm of Mr. Bartlett, or in any other way, they can be reclaimed, it surely is worthy of the experiment."

From Steele's Treatise on Grasses.

ORCHARD GRASS.

This grass appears to have a greater variety of merits than almost any other grass. It soon arrives at maturity; it bears cropping well, is very productive, and its nutritive powers are considerable. It is much less impoverishing to the soil than rye-grass, and when ploughed in affords a greater quantity of nutritive matter to the soil. It has been objected to Orchard Grass, that it rises in tufts, and is apt to become coarse. But the objections will apply to every grass that is not sown sufficiently thick to occupy with plants every spot of the ground, and that is not sufficiently stocked to keep the surface in a succession of young leaves. It is the practice of thin sowing, and the strong reproductive powers of the plant, that occasion it to appear a bit coarse grass. If one species only is therefore thought preferable to several in the Alternate Husbandry, there is scarcely a species to be preferred to the Orchard Grass. But with respect to an early and certain supply of the most nutritious herbage throughout the season, it will be found a vain labor to look for it in one species of grass, but where Nature has provided it, in a com-

bination of many. It will likewise be found, that the Orchard Grass, from its more numerous merits, should substitute three parts of a mixture of grasses adapted for the purposes of Alternate Husbandry. The different species most proper to combine with Orchard Grass, are such as possess in a greater degree the properties of which this grass is deficient. For this purpose, none appear better fitted than the Hard Fescue, Meadow Fescue, Timothy or Herd's Grass, Rye-Grass, and White Clover, which should be in a smaller proportion. A combination thus formed, of three parts Orchard Grass, and one part of these species just mentioned, will secure the most productive and nutritive pasture in alternation with grain crops, on soils of the best quality; and even on soils of an inferior nature, under the circumstances of unfavorable seasons, will afford nutritive herbage, when otherwise the land would have been comparatively devoid of it, if one species of grass only had been employed.

FRUIT.

As soon as the warm weather commences, editors begin their caveats against the use of fruits. A prejudice of this kind existed about two centuries ago, but we believe it is entirely exploded in the estimation of the physicians of the present day. Tourtelle in his "Principles of Health," (a treatise pronounced by Haller, the best work on the *prophylaxis morborum* extant in his day,) says:—"The author of nature has caused fruit to grow in abundance in warm countries or warm seasons, being absolutely useful to man. Hence it happens that a kind of instinct excites the human species to seek them in preference to other aliments in these countries and in these seasons, as well as in cases where the humoral system tends strongly to become bilious."

It would rather become editors to caution their readers against the *abuse* of fruit than the use of it. They would thus cease to create unnecessary scruples in those who use fruit to the advantage of their health, and no longer interfere with the interests of the poor, who make a livelihood by vending it.—*Hinderton, N. J. Gazette.*

APPLEY.

General blood letting should always be preferred in the first instance to local, and it should be continued until decided effects are perceptible on the system.

BLEEDING FROM THE NOSE.

In a very interesting case of this affec- tion, communicated by the late Dr. James Kent, Ph.D. to his friend, Professor J. B. Beck, of this city, and which threatened to terminate fatally, the admission of cold water, by pailful over the head and shoulders, proved almost immediately successful.

RUNS.

In cases of extensive injury from this cause, one of the most successful applications, hitherto resorted to, has been the oil of turpentine. In the action which occurred in 1815, between the U. S. frigate *Guerriere* and an Algerine frigate, nearly fifty men belonging to the former were severely burnt by the explosion of one of the large guns. Some of these men were in a most pitiable condition, and suffered the most exquisite torments. They were taken down to the cockpit, and spirits of turpentine freely poured over their naked wounds. They all did well.—*Am. Farmer.*

REMEDY FOR WHOOPING COUGH.

Take of dried coltsfoot leaves (that have not been gathered more than a year) a good handful, cut them small, and boil them in a pint of spring water, till half a pint is boiled away; then take it off the fire, and when it is almost cold, strain it through a cloth, squeezing the herb dry as you can, and then throw it away. Dissolve in the liquor an ounce of sugar candy, finely powdered, and to a child three or four years old give one spoonful of it, cold or warm as the season favors, three or four times a day, or oftener if the fits of coughing come frequently, till well. For older or younger persons, the quantity may be increased or diminished, as thought proper.

This preparation is useful also in asthma, phthisis, shortness of breath, consumptions, &c.

N. B.—When sugar candy cannot conveniently be had, perhaps honey or good clean brown sugar would answer. Sugar candy is, however, to be preferred.

Another.—Dissolve a scruple of salt of tartar in a gill of water; add ten grains of coltsfoot, finely powdered; sweeten this with sugar. Give to an infant the fourth part of a table spoonful, four times a day; and from four upwards, a spoonful may be taken. The relief is immediate, and the cure in general effected within five or six days.

Accident by bees.—As Mr. Martin Lazarus, of Salisbury Township, (Lehigh county) was employed in hading manure, in a three horse wagon, a bee happened to light on the leader horse, whilst passing the garden fence and stung him. This started not only the leader, but also frightened the other two horses, and in endeavoring to stop them, the wagon came in contact with the garden fence, tore it away, and upset a whole row of hives. The enraged bees all fell upon the horses and men and stung two of the horses to death, and very much injured the other, as well as Mr. Lazarus, his son, and servant. The son, in particular, was seriously injured, having been thrown between the wagon and the fence post; he is considered out of danger, however.

Paper making.—It is stated in a late London paper, that a great improvement in the art of paper making has been invented, and is about being adopted in most of the large manufactories of Great Britain. It is a powerful drying steam-machine, containing four large cylinders, through which a web, in the fullest sense of the term, passes, and obtains by the pressure a surface smooth and even in every part, and is cut to any size.

Temperance.—The frame of a new Presbyterian Meeting House, was erected in Gormin, in this county, on Thursday the 21st inst. without the aid of ardent spirits. The concourse of people was unusually great, and yet such a degree of contentment, sobriety, and activity, was exhibited, as to be highly honorable to our citizens.

Other buildings have been recently erected in this vicinity, and crops secured during the most pressing seasons of business, without the use of intoxicating liquors; and although no society has yet been formed here for the suppression of intemperance, our intelligent farmers of their own accord, seem to be making powerful efforts to banish the monster from their borders.—*Ontario Repos.*

An important fact.—A proprietor in one of the forwarding lines on the canal, has just assured us that their line has not brought more than one fifth

of the quantity of ardent spirits the present, as in previous seasons, in proportion to the quantity of other articles of merchandize. What has produced this diminution in the quantity of this article? Have cold water societies? "He that runs may read." The spirit of reform is abroad—its effects are seen.—*Rochester Obs.*

THE WORCESTER COAL MINE.

The operations in the Worcester Coal Mine, formerly worked by Mr. Elliot, have been commenced on a scale so extensive, and prosecuted with an industry so busily, under the direction of Col. Binney, as will render the locality one of the most interesting scenes in the Commonwealth.—A deep cutting commenced at the foot of the hill, is worked onward through earth and rock, and will become a grand canal for the transportation of the mineral from the interior to the surface, on the waters drained from the mine. About twenty feet below the surface, on the declivity of the hill, at the point near where the former excavation was carried deepest, an opening like a door way admits the visitors into a gallery or shaft, about seven feet in width and height, and now nearly twenty-five in length, descending with the slope of the strata. The workmen are employed in piercing the rock and opening this passage into the hill. The substances excavated are conveyed to the entrance by little cars moving on miniature railways up the inclined plane. The mineral obtained resembles very much the coal from Newport and is said to improve in quality as the shaft descends. Roads are constructing which will render the approach easy, and canals are projected to communicate with the neighboring lake.

National Regis.

SMUT IN WHEAT.

[By the Editor.]

The following miscellaneous particulars respecting smut, and the means of preventing it, merit attention:—1. The same water should never be used but once in washing wheat; even when brine is employed, it is safest to have fresh liquor to each parcel. 2. Lime is not only of service to dry the seed, but by its caustic and antiseptic qualities, it tends to destroy putridity, and annihilate of every description. 3. If smutty grain is not threshed till the June or July succeeding the year it was reaped, the dust, it is said, will become too volatile to attach itself to the grain when threshed, particularly by a mill; nor is old seed wheat so liable to occasion smut, which by age loses the power of reproduction.—4. Notwithstanding the violence of threshing mills, they do not bruise the smut balls so much as the flail. 5. Great care must be taken, not to thresh wheat on a floor where smutty wheat has been threshed, nor to convey the seed in a sack in which smutty wheat has been formerly put.

On the subject of steeping, it may be proper to add, that it would be well to extend that operation to other grains besides wheat. Every sort of seed should be steeped enough to promote a quick vegetation, and to secure a more uniform growth, which would greatly improve both the quantity and quality of the grain; and if the seed of barley and oats, as well as of wheat, were clothed with saline and caustic particles, it would either preserve it entirely from the attacks of vermin, or destroy such as may venture to eat of it.

We have been informed that unslacked lime

answers an excellent purpose for preparing wheat for seed. A gentleman states, that he put four or five pounds of quick lime into a sufficient quantity of water to soak a bushel of wheat; then added the wheat, and permitted it to remain about twelve hours. The lime by slacking raised the temperature of the water to about blood heat, and the wheat became soft and parboiled. On sowing it, however, it sprouted much sooner than usual, flourished remarkably, and produced an excellent crop, entirely free from any appearance of smut.

The following has been recommended by a farmer in Vermont:—"My method is this: I take three quarts of slacked lime to each bushel of wheat, put them into a barrel, a layer of wheat and a layer of lime, alternately. Then pour in water, till it is all covered. In this condition let it stand from two to four days, as the case may require; and the morning before sowing the wheat, tap the barrel and draw off the liquor."

In preparing wheat for grinding it is often made too dry, especially after it has been washed to free it from smut and other impurities. When the wheat is dried too much, the outside of the kernel, which should be separated from the flour by the bolt, is ground so fine that it passes through the bolt with the flour. An experienced miller advises to moisten wheat which is in this situation, by sprinkling it with a little water about ten or twelve hours before grinding. But if this is neglected, a slight sprinkling of the wheat in the hopper during the time of grinding it will be of service; taking care not to wet it too much, and by stirring the grain, to distribute the moisture as equally as possible among the whole mass.

ORIGIN OF RIVERS.

A question has long existed among philosophers, and has never been settled by universal consent, whether the rivers depend solely for their supply upon the water which descends from the atmosphere, or whether there is a kind of circulation of water within the earth, like that of the blood in the animal economy, or that of the winds of the atmosphere, by means of which perennial springs are constantly supplied, by some mechanical process in nature, from the fountains of the great deep." Ricciolus affirms, upon calculation, that the Volga or the St. Lawrence alone discharges annually a greater quantity of water than falls in rain, snow and dew upon the whole surface of the globe. These and other known rivers are said, upon a very moderate calculation, to discharge more than five hundred times as much water into the sea as falls in rains, &c. It would seem, therefore, that there must subsist subterraneous communications between the sea and the sources of fountains, rivers and larger springs, by which these are supplied; and this opinion is corroborated by the known existence of Charybides, which swallow the sea; if these happen to be stopped, the largest rivers have been said to be dried up, and wholly ceased to run for a considerable time. It is stated in Rees' Cyclopædia, that there are accounts in history of this having happened to the Thames, the Medway, and the Trent, in England; the Elbe, the Motela, and Gulspar, in Sweden; and other rivers in other countries. On the contrary, if these Charybdis happen to be too open, fresh water springs depending upon them become salt. Pliny relates, that this once happened in Caria, near Neptune's Temple. Various other instances have been stated by historians, ancient and modern.

Curing blindness.—The story in the Apocrypha, of Tobit's blindness being cured by the gall of a fish, has been much ridiculed. Prideaux thought it not reconcilable to a rational credibility. But the Richmond Family Visitor states, that Dr. Manlove, a physician of extensive practice in Dinwiddie county, Va. thirty or forty years ago, left on record, on the margin of Prideaux's Connexions, the following note:

"That the gall of an eel, laid on with a soft brush, with great care, and occasionally repeated, has successfully removed a film from the eye, is most certain. The writer of this leaves it on record in this place, with an intention that it may be useful to some fellow creature, after the writer is no longer an inhabitant of this world. I most solemnly declare, I have experienced the good effects of the application in the course of my practice. But it should be used when the disorder is recent."

Calvin Beaton, Esq. of Lebanon, has purchased within the last few weeks, 112,893 lbs. of Merino and half blood wool for the Boston market—all the produce of farms, principally in this state, within twenty miles of and including Lebanon.—For this he has paid \$46,996. The average price he has paid was about 10 cents the pound. The sum of money paid for the products of one summer in one article—and it is not to be presumed that all the article was included—is more considerable than we have ever known by any single individual, in a single article, the produce of our farms.—*N. H. Patriot.*

Cure for Wens.—The following extraordinary fact has lately come to our knowledge:—A planter in the vicinity of Raleigh, N. C. had been for some time afflicted with a wen on his neck, which grew so large as to be very inconvenient and distressing. After trying a number of remedies, he was advised by one of his neighbors to wash it two or three times a day with strong salt water, (water in which salt had been dissolved.) He did so, and to his great relief and comfort, the wen gradually decreased in size, and finally disappeared. Let those who are similarly afflicted, "go and do likewise."—*Raleigh Register.*

HOW TO MAKE STARCH.

To make starch from wheat, the grain is steeped in cold water until it becomes soft and yields a milky juice by pressure; it is then put into sacks of linen, and pressed in a vat filled with cold water; as long as any milky juice exudes, the pressure is continued; the fluid gradually becomes clear, and a white powder subsides, which is starch.—*Doct. Elements of Agricultural Chemis.*

Method of preserving Cheese from Worms and Mites.—Grains of whole pepper, put into a vessel in which cheese is kept, will drive away the above mentioned insects.

Probably pods of red pepper would answer the same purpose.—*Editor.*

Economy of Time.—The Chancellor D'Aguesseau, finding that his wife always kept him waiting a quarter of an hour after the dinner bell had rung, resolved to devote the time to writing a work on Jurisprudence. He put this project in execution, and in the course of time produced a quarto work of four volumes.

SILK.

Of the rearing of Silk Worms in the last period of the Fifth Age, that is, until the Cocoon is perfected.

Continued from page 51.

The fifth age can only be looked on as terminated, when the cocoon is perfected.

The cleanliness of the feeding frames in these last days of the fifth age, requires great attention, to preserve the health of the silk worms.

About the tenth day of the fifth age, the worms attain perfection, which may be ascertained by the following indications:

1st. When, on putting some leaves on the wickers, the insects get upon the leaves without eating them, and rear their heads as if in search of something else.

2d. When looking at them horizontally, the light shines through them, and they appear of a whitish yellow transparent color.

3d. When numbers of the worms which were fastened to the inside of the edges of the wickers, and straightened, now get upon the edges and move slowly along, instinct urging them to seek change of place.

4th. When numbers of worms leave the centre of the wickers, and try to reach the edges and crawl upon them.

5th. When their rings draw in, and their greenish colour changes to a deep golden hue.

6th. When their skins become wrinkled about the neck, and their bodies have more softness to the touch than heretofore, and feel like soft dough.

7th. When in taking a silk worm into the hand, and looking through it, the whole body has assumed the transparency of a ripe yellow plum. When these signs appear in any of the insects, every thing should be prepared for their rising, that those worms which are ready to rise may not lose their strength and silk in seeking for the support they require. Handle the worms at this stage with the greatest gentleness, as the slightest pressure injures them. When moved, they should be left on the twigs or leaves to which they are fastened, to prevent their being hurt by tearing them off. A blunt hook should be used to take up those not adhering to leaves or twigs.

Preparation of the Hedge.

A week or ten days before the worms are ready to mount, bundles of twigs of chestnut, hickory, oak, or of the birch of which stable brooms are made, must be procured, prepared, and arranged in bunches, so that the worms may easily climb up them, to work their cocoons. As soon as it is observed that the worms want to rise, the bundles of twigs must be arranged on the feeding trays, leaving fifteen inches between them. The top branches should touch the lower part of the tray above that on which they are placed, so as to form an arch—and be placed a little aslant, that the worms when climbing may not fall off. The branches should be spread out like fans, that the air may penetrate through all parts, and the worms work with ease. When the worms are too near one another, they do not work so well, and form double cocoons, which are only worth half a single round cocoon. Leave openings at the tops of the curves, for the worms to form their cocoons in.

As soon as the worms are prepared to rise, the feeding frames should be cleaned thoroughly, and the apartment well ventilated. Put the worms which are ready to rise near the hedge-

es, and give a few leaves to those that are still inclined to eat. After they have begun to rise, those that are weak and lazy do not eat, do not seem to be inclined to rise, and remain motionless on the leaves. These should be taken away, and put in a clean dry room, of at least 75° of heat where there are hurdles covered with paper, and the hedge prepared for them. The increased heat will cause them to rise directly. All the silk worms being off the hurdles, they should be immediately cleaned.—The temperature of the room should be between 68° and 71°. When the worms are forming their cocoons, the utmost silence must be preserved in the room, as they are very sensible to noise, and if disturbed, will for a moment cease to spin: thus the continuity of the thread will be interrupted, and the value of the cocoon diminished. When the cocoons have attained a certain consistency, the apartment may be left quite open.

Sixth Age, beginning in the Chrysalis State, and ending when the Moths appear.

The following are the necessary things to be done:

1. To gather the cocoons.
2. To choose the cocoons which are to be preserved for the eggs.
3. Preservation of cocoons until the appearance of the moth.

I. Gathering of the Cocoons.

Strong, healthy, and well managed silk worms, will complete their cocoons in three days and a half at farthest, reckoning from the moment when they first begin casting the floss. This period will be shorter, if the silk worms spin the silk in a higher temperature than that which has been indicated, and in very dry air.

It will be better not to take off the cocoon before the eighth or ninth day, reckoning from the time when the silk worm first rose. They may be taken off on the seventh, if the laboratories have been conducted with such regularity, that the time may be known with certainty, when this may be done.

Begin on the lower tier of hurdles, and take the cabins down gently, giving them to those who are to gather the cocoons; place a basket between two of the gatherers, to receive the cocoons; another person should receive the stripped husks, which may be laid by for another year.—All the cocoons that want a certain consistency, and feel soft, should be laid aside, that they may not be mixed with the better. Empty the baskets upon hurdles or trays placed in rows, and spread the cocoons about four fingers deep, or nearly to the top of the feeding frame. When the cocoons are detached, the down or floss in which the silk worms have formed the cocoon, should be taken off. If the cocoons are for sale, weigh them, and send them to the purchaser. The baskets, the floor, and all things used, should be cleaned.

When gathering the cocoons, make four assortments:—1st. Those designed for breed. 2d. The dupions, or double ones. 3d. The finest of those which are to be reeled. 5th. Those of a looser texture.

REMARKS OF DR PASCALIS, AT THE LATE MEETING OF THE NEW YORK HORTICULTURAL SOCIETY.

MR. PRESIDENT—Happy, thrice happy, the return of an anniversary festival, which exhibits again an abundant crop of splendid flowers and

delicious fruits, opening at the same time new prospects for practical skill in objects of domestic economy, and of a precious produce for manufacturing industry.

I was alluding, Mr. President, to the growth of silk, to which the administration and congress have impressively called the public attention of their fellow citizens. The most essential part and true foundation of it, is the choice and propagation of the mulberry tree, which should be entrusted to our horticulturists. By natural right this produce should belong, in common with others, to nations located by Providence on the whole extent of the temperate zone, and so much of domestic comfort and general wealth as it imparts, should be secured to our numerous fellow citizens. In a word, no great or populous nation of the world was ever deprived or bare of that rich staple from the combined power of animal and vegetable agency.

The heroic or fabulous records of ancient Greece hold yet in celebrity the naval expedition of Jason with his Argonauts, to the nearest spot or rendezvous of Asiatic merchants (Colchis), in order to obtain or to conquer the *Golden Fleece*, suspended on a tree guarded by a dragon! than which allegory none could more explicitly designate a treasure of silk, appended on the parent tree, under the keeping of the *Seres* or Chinese, the original proprietors, and protected by the Dragon, the ancient and everlasting Flag of that nation!

However hidden, then, and long after the art of raising silk remained to the Greeks, we find that they manufactured it in the Island of Cos, whether with their own or with foreign materials.

As for the Romans, their ambition ever was turned to conquest and dominion—in fact they became possessed of all the treasures of the world, among which silk is mentioned, even as the most extravagant article of luxury. One of their emperors thought it was too expensive as the material of a garment of his empress, while matrons and courtezans of that most corrupt capital exhibited themselves ornamented with it.—Poets and satiric writers reprobated it, until an imperial decree forbade it to the male citizens as an effeminate and unmanly bodily decoration.—But the more sober people of the Greek empire, who during several long periods cultivated the useful arts, were soon taught by useful Christian missionaries how to foster and promote the culture of silk, which was extended all over the luxuriant and fertile banks of the Bosphorus: since which period it has kept pace with the influence, ascendancy and dominion of powerful governments. The Caliphs of Mahomet, even after they had extended their conquests on the coasts of the Mediterranean Sea, planted the mulberry in the Morea, in Spain and in Sicily.

From the last, Charles the IXth of France, having conquered Naples, at the head of his knights, enabled his triumphant return home with the mulberry and silk-worm seeds.

In fine, the acquisition became completely appropriated to the most favorable districts of his kingdom, under Henry the IVth, one of the best of kings, with the help of his truly honest minister, Sully. Every peasant and country farmer could boast of a well tenanted barn-yard, of a fig tree shading his door, and a mulberry in his avenue.

Excuse, Mr. President, this historical digression,

if, in continuation of it, your name and that of this Horticultural Society be added to it, by fostering and encouraging the culture of the mulberry, so necessary to the introduction of the domestic staple of silk. To effect it, it must be general, and not be left to private speculation or monopoly.—The growth of silk is not involved in any secret or mystery. Aged women and children can be adequate to all its cares and tasks, under the dictates of domestic economy. Thus it has been flourishing and established among great nations. One only which could not assimilate it to the asperity of its climate, has nevertheless established a great empire by the means of manufacturing this precious produce, and has become the rival of other nations. I give, Mr. President—

The continuation of the labours of the Horticultural Society of New-York—And as they have promoted domestic comfort and happiness, they will also secure commercial industry and economy.

From the Middletown (Conn.) Sentinel.

MOHAWK BRIAR.

The correspondent who favored us with the following notice of a valuable remedy for sores, (either inflamed or not) accompanied it with two specimens of the vines—the larger kind which loses its leaves in the fall, and the smaller which retains them, in all their verdure, until the month of March. They run on trees, bushes, &c. and as the leaves bear some resemblance, they would, at a short distance, be mistaken for grape vines. The stem or vine has great numbers of thorns on them, three-eighths of an inch in length. If, as our correspondent states, it possesses such invaluable healing properties—of which he has had actual experience—it should surely become more generally known and appreciated. It is common in that part of our town called “Upper-houses.” The leaves only are to be used, and in their natural state, without any preparation whatever.—They are cultivated, in some parts of our town, as ornaments around the house. Any gentleman who wishes to see a specimen of the vine and leaves, can do so by calling at our office.

Mr. Starr.—The following simple remedy, if duly attended to, would, in thousands of cases, save much expense to many persons, and relieve the patient from much pain. Apply the leaf of the Mohawk briar, or as it is sometimes called the Watkley briar, or Green Briar, as a dressing to any sore, however inflamed and painful, it very soon gives relief, removing the inflammation more effectually than any poultice I ever new applied, the leaves to be changed as occasion requires.—The leaves being smooth as glass, never sick so as to pain or trouble. They are beyond doubt the best dressing to follow blistering that can be applied.

The briar grows like the grape vine in clusters, running on bushes and trees, and bears a dark colored berry, on which partridges are fond of feeding in winter. A smaller species grows more thin and scattering, and are equally valuable, holding the leaf green until March. They are found in swampy lands, inclining to sandy plains. Any person who may make a thorough trial of them, will value them highly.

There are in the State of Connecticut, about 400 Ministers and 300 Lawyers. The whole number of Clergymen in New-England at the commencement of the Revolutionary War, was about seven hundred.

ASHES.

Leached ashes are much used, in some parts of the United States, as a manure. Great quantities are annually taken from the city of Philadelphia to Long Island, for the purpose. They cost here 40 cents per one horse cart load, and commonly bring one dollar fifty cents, when delivered. From a paper in the first volume of the *New York Agric. Society Trans.* by Mons. E L'HOMMEDE, it appears, that ashes are found to succeed best on dry loamy lands, or loam mixed with sand. It is considered as the cheapest manure that can be procured. Ten loads of this manure, on poor land, will produce ordinarily twenty-five bushels of wheat, which exceeds, by five dollars, the expense of the manure; and the five dollars pays for the expense of labor in raising the crop. The land is then left in a state for yielding a crop of hay of between two and two and a half tons per acre, which it will continue to do for a great number of years. No manure continues so long in the ground as ashes.

[In New York state, the back country farmers pay all the expense of clearing their land by the ashes of the wood burnt on it. One bushel of field ashes of oak, is worth 12½ cents. Of hickory 18 cents. One bushel of house (hearth ashes,) of oak is worth 18 cents; of hickory 25 cents at this day, (1819.) A bushel of good oak ashes yields about 4lbs. of potash, of hickory ashes about 6lbs.

It is surprising all new planters do not pursue the same economical plan. The ashes are mixed with one fourth of good lime, and leached. The ley is evaporated into potash in large cast iron boilers.—T. C.]—*Domestic Encyclopedia.*

From the Newburyport Herald.

ESSEX AGRICULTURAL SOCIETY.

The Essex Agricultural Society will hold their annual exhibition on Thursday the 26th of Sept. inst. near the lower meeting house in West Newbury, to commence at 9 o'clock, A. M. This Society has been liberal in bestowing premiums on the various objects exhibited, and it is hoped the next show will surpass any which has preceded it. It is very desirable that more competitors should present themselves for premiums for the best butter and cheese, than appeared the last year; these premiums are \$20 for the best, and \$10 for the next best. These liberal premiums ought surely to induce the farmers to avail themselves of this offer by exhibiting such quantity of each article as is required by the printed directions.

At the last show there were but three parcels of cheese presented, each was of good quality, and it was rather difficult to determine which was the best, yet two of the competitors received the very liberal premiums of 20 and 10 dollars.

Of butter there were but three small lots exhibited, the owners not having entered it for premium.

Among the numerous good farmers of the county of Essex, and particularly of the Newburys, it cannot be doubted that it would be very easy to comply with the wishes of the society and send premium or exhibition parcels of butter, that would equal any that is made in our country, and if they inclined to sell, would find liberal purchasers that would give as good a price as the same article would command in the Boston market.

A FARMER.

A BEAUTIFUL, NEW AND USEFUL INVENTION.

We have in our possession, and shall be glad to exhibit, a beautiful and *robber proof* travelling trunk, made of a new material, which is thus described in the specification of the patentee:

“This cloth is made of hemp and wire, which is spun together, woven and twilled in the same way that all other cloths are. The hemp is twisted tight round the wires, and they are woven together in the same manner in which the common bagging is made. It may, however, be woven tight or open, to suit the purposes for which it may be required, and after this operation it should, in all cases, be painted on both sides; this serves to prevent the hemp from rotting, and the wire from rusting. You may, if you please, put many coats of paint upon it, (suited to the object,) which will make the surface solid, smooth and elegant. This cloth may be used for many purposes, not only for boots of stages, but for carpeting, sackings bottoms of bedsteads, fancy chairs, sofas, pannels, (or in fact bodies,) or roofs of carriages, baskets, water buckets, for travelling trunks, or the security of the mails.”

There would really seem to be no end to the durability of whatever is constructed of these materials, and we know not why they may not be applied to all the objects enumerated, as well as to various others. The trunk, while it is completely impenetrable, is lighter than the ordinary trunk. We readily think that editors of papers would benefit the public by the notice of this invention, whilst they would assuredly serve a very worthy citizen, by contributing to bring his valuable invention into immediate use.—*American Farmer.*

NEW INSECT.

The *ground pear*, which abounds in many of the West India Islands, and was formerly supposed to be a fossil, has been proved by the researches of the Rev. L. Guilding, to be the nidus of a living insect. This new insect which is supposed a parasite on the great ant of the West Indies, is remarkable, as not being provided with a mouth, its food being conveyed through a tube in each of the four claws. The animal also has the power of throwing out long filaments from its body in dry weather, supposed to be with the view of attracting moisture for its preservation. An interesting paper was recently read, describing this insect, by Mr. Guilding, before the Linnean Society.

New Agricultural Journal.—Blackwood, the well known publisher of Blackwood's Magazine, has recently issued a Prospectus of a Quarterly Journal of Agriculture, which will not only be enriched by the Prize Essays and Transactions of the Highland Society of Scotland, but receive the contributions of the ablest Agriculturists in the Kingdom.

A good day's work.—Mr. Joseph Osborne, of Centre township, on Tuesday last walked three miles from home, mowed three and a half acres of meadow, and returned home again in the evening. There were upwards of two and a half tons of hay on each acre, a great part of which was badly lodged, and some lying flat on the ground. The meadow was clean mowed and cut close. All this was done without the use of a drop of spirituous liquors. Who can beat this?—*Indiana, (Pear.) Whig*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 12, 1828.

LUCERNE.

MR. DAVID BEAL of Kingston, Ms. informs us that he sowed two lbs. of Lucerne in the spring of 1827, which yielded him two heavy crops the first season. It was sowed with oats, and red top.—In 1828 it was mowed on the 20th of June—on the 11th of July the second crop was cut, when it was 21 inches high, having grown 1 inch per day, since the first mowing. It grew rapidly for the third crop, and was in flower, when circumstances obliged him to turn the field into pasture. Horses, Cows, and all kinds of stock give it a decided preference to other grasses.

TURNIP ROOTED CABBAGE.

MR. CORNELIUS COWING, of Roxbury, has left at the New England Farmer office a root of the Arabian Kohl Rabi, or Turnip Rooted Cabbage, which has a solid bulb 17 inches in circumference.

This curious variety of cabbage is a native of Germany, where it is much cultivated. They take it up before the frost sets in, and protect it like potatoes or turnips, for winter use. The produce is nearly the same as that of Swedish turnips, and the soil that suits the one is equally good for the other. It may either be sown in drills, or raised in beds, and transplanted like cabbages; in this case, the beds require to be made and sown the preceding autumn. Two pounds of the seed will produce a sufficiency of plants for one acre of ground. The stem is swollen like a bulb, and when divested of the leaves may easily be mistaken for one. Hares are so fond of it, that on farms where these animals abound, the culture of this plant is found to be impracticable. Sir Thomas Tyrwhitt first introduced kohl rabi into England from Germany. Messrs. Gibbs and Co., seedsmen to the Board of Agriculture, raised in one year, one ton and a quarter of the seed, and continue to supply the demands of the public for it, and for all other agricultural seeds of the best quality. 64 dr. of the bulb of kohl rabi afford 105 grains of nutritive matter.

SPOTFORD'S GAZETTEER.

We have taken a cursory view of a work recently from the press of Charles Whipple, of Newburyport, entitled *A Gazetteer of Massachusetts; containing a General View of the State, with an Historical Sketch of the Principal Events from its Settlement to the present time, and Notices of the several Towns, alphabetically arranged.* By JEREMIAH SPOTFORD, Counsellor of the Massachusetts Medical Society. With a Map of the State. It appears to be the result of much labour and research, and if rated by the scale of utility, will be found not only in the library of every man of letters, but on the book shelf of every farmer and mechanic in Massachusetts. The author has well observed in his preface, "Excepting the few who have met in the Legislature, the inhabitants of Berkshire and Barnstable, or of Hampshire and Essex have been less known to each other than the inhabitants of Europe and America; and it would be easier in the eastern parts of the State to find persons, and especially youth, who could describe with geographical accuracy, the Nile or the Ganges, than those who would give a tolerable account of the Moosie or Housatonic." This ignorance of the topography of our own State and neighborhood,

so justly animadverted on, might heretofore find an apology in the want of those means of information, which this book is calculated to supply; and knowledge as well as charity to be most useful should begin at home.

• MR. FESSENDEN—I enclose to you a recipe for a cheap and durable paint, I received whilst on a recent visit to the eastern shore of Maryland; which you can, if you please, insert in your useful journal. I have had occasion to use it myself the last summer, and can recommend it (as the best and CHEAPEST paint that can be used) to those farmers who wish to preserve their buildings at a small expense.

Respectfully your obedient servant,
C. THORNDIKE.

PAINTING IN MILK.

Skimmed Milk four pounds, or half gallon.
Lime, neatly slacked, six ounces.
Lined Oil, or Neat Suet Oil, four ounces, or one gill.
Spanish Brown Lead a half lb. Venetian Red Lead a half lb.

Put the lime into an earthen vessel, or into a clean bucket, and having poured over it a sufficient quantity of milk, add gradually the oil, stirring the mixture with a wooden spatula; then pour in the remainder of the milk, and dilute the Spanish brown with a part of the milk. Milk skimmed in summer is often curdled, but this is of no consequence for the present purpose.

The milk must not be sour, because in that case it would form with the lime an earthy salt, susceptible of attracting the humidity of the atmosphere. The lime is slacked by immersing it in water, from which it is taken that it may be suffered to effloresce in the air. The Spanish brown is pounded, and carefully strewn over the surface of the liquid: it gradually becomes impregnated with it, and falls to the bottom; consequently the mixture must be frequently stirred.

This process is applicable to any kind of pains made with chalk, or white argillaceous earths.

The above quantity will be sufficient for twenty five yards of the first coating. RESINOR'S painting in milk, for painting out door objects, add to the foregoing composition for painting in milk:

Slacked Lime, }
Oil } Each two ounces.
White Turpentine, }

Put the turpentine into the oil, which is to be added to the liquid milk and lime; in cold weather the milk and lime must be warmed. Any color can be given by substituting whitening or any dry colors, chalk, ochres, &c. &c. for the Spanish brown and Venetian red.

WEEVIL IN WHEAT.

MR. FESSENDEN—The season for sowing wheat is near, and that section of the country, lying on the east shore of Lake Champlain, has been much troubled with the insect called the *Weevil*, a small brown insect, which eats into the kernel; and has partially, and in some cases wholly destroyed pieces of wheat. As we have not been troubled with them before this season, please, Sir, inform through the medium of your paper, whether we shall be subject to them the next season in consequence of having had them this; or whether seed wheat which has come of them it would be more liable to them than old seed, which was raised before they came about, and any other information which you may know of them, which may be useful to those unacquainted with the insect, and oblige

Yours with much respect,

HARVEY DEMING

Salisbury, (Vt) Aug 26, 1828.

Remarks by the Editor.—We are happy to com-

municate all the information we can at present command on this subject; and hope it will attract the attention of those of our friends and correspondents who may be able to prescribe some remedy against the ravages of the insect.

The Weevil or Cornchafer, *Carcullio granarius* is a species of insects bearing a resemblance to oblong, soft worms. They are provided anteriorly with six scaly legs, and their head is likewise covered with scales. Some species of these larvae are dreaded for the mischief they do in granaries; as they find means to introduce themselves, while small, into grains of wheat, and there fix their abode. It is very difficult to discover them, for they lie concealed within the grain, grow slowly, and enlarge their habitation, in proportion to their size, at the expense of the interior meal, on which they feed.

Corn-lofts are frequently laid waste by these numerous insects, which devour immense quantities of grain. When the cornchafer, after having consumed all the meal, has attained its full size, it remains within the grain, hides itself under the empty husk, and subsists alone; there it undergoes its transformation, and becomes a chrysalis: nor does it leave the grain, till a perfect insect, when it makes its way through the husk.

The Society of Meaux in France has invited all those who may think proper to make use of the following very simple method of preserving grain from Weevils, and other insects, to communicate the result of those trials.

Soak cloths, made of flax, in water, wring them and cover your heaps of grain with them; in two hours time you will find all the weevils upon the cloth, which must be carefully gathered up, that none of the insects may escape, and then immersed in water to destroy them.—*Domestic Encyclopedia.*

M Duhamel has observed that a considerable heat is necessary for hatching the eggs of the weevil, and that this insect cannot breed in granaries that are well ventilated. To prevent this he made repeated experiments, the results of which made it evident that this insect cannot multiply in grain that retains a proper degree of coolness, which it may be made to do by frequent ventilating. When grain is agitated in a sieve fine enough to retain it, the weevils contract their legs, and are, in that position, so much smaller than the grain, that they drop through the sieve.

The Farmer's Assistant observes, that the weevil is "a little black bug, very destructive to wheat, either in barns or granaries. On thrusting your hand into a bin of wheat infested with them, considerable warmth will be felt; but as they are usually collected together, every part of the heap, or bin should be examined.

There are various ways of keeping wheat clear of this insect, after it has been threshed out and put in bins. Mr L. Hommedieu found that a sprinkling of lime with wheat infested with them in his bin soon drove them away. The lime can be afterwards winnowed out.

Sulphur or snuff put up in little papers or bags, and properly distributed among the wheat in the bin, will keep them out, or drive them out when they have got possession.

A plant of hellebore has the same effect; and so have the leaves and wood of the Lombardy poplar. A bin made of the boards of this wood will never have a weevil in it.

Take wet linen cloths, and lay them over a

MISCELLANIES.

MILITIA.

Hamilton's opinion of the Militia System forty years ago.

In 1787, when our militia were few in number compared with the present time, Alexander Hamilton observed, "The project of disciplining all the militia of the United States is as futile as it would be injurious if it were capable of being carried into execution. A tolerable expertness in military movements is a business that requires time and practice. It is not a day, nor a week, nor even a month, that will suffice for the attainment of it.—To oblige the great body of the yeomanry, and other classes of the citizens, to be under arms for the purpose of going through military exercises and evolutions as often as might be necessary to acquire the degree of perfection which would entitle them to the character of a well regulated militia, would be a real grievance to the people, and a serious public inconvenience and loss. It would form an annual deduction from the productive labor of the country to an amount which, calculating upon the present number of the people, would not fall far short of 4 millions of dollars. To attempt a thing which would abridge the mass of labor and industry to so considerable an extent, would be unwise; and the experiment, if made, could not succeed, because it could not long continue. Little more can reasonably be aimed at, with respect to the people at large, than to have them properly armed and equipped; and in order to see that this be not neglected, it will be necessary to assemble them once or twice in the course of a year."

Drowning. We perceive, by a London paper, that the *Stomach Pump* is recommended to aid the recovery of drowned persons. This valuable invention having been successfully used in ejecting poison from the stomach, we see no reason why it should not be used to draw from the stomach the body of water which is the cause of suffocation in drowning. We hope that humane institutions will add the stomach pump to their apparatus, and learn persons how to use it. We are sanguine of success in cases of drowned persons.

Southern paper.

A challenge.—A little boy, conceiving himself insulted by a gentleman, who ventured to give him some wholesome advice, strutted up to him with an air of importance, and said, "sir, you are no gentleman! here is my card—consider yourself challenged." Should I be from home when you honor me with a call, I shall leave word with a friend to settle the preliminaries to your satisfaction." To which the other replied—"sir, you are a fool—here is my card—consider your nose pulled! and should I not be at home when you call on me, you will find I have left orders with my servant to kick you into the street."

The Roman Matron showed her CHILDREN as her most precious treasures. How anxious must she have been to have had them grow up with augmented lustre and value! And how much agony must she have felt, if she perceived that they began to tarnish and decay, in contempt of all her efforts and solicitude, and that those occasionally entrusted with their care, instead of striving to preserve them pure, contributed to fix an incurable taint on them.

An accident of an extraordinary nature took place a short time ago in the Calton. The wife of a shoe-maker had been for a considerable time lying ill of a fever, but was gradually recovering. She, however, suddenly relapsed, and as her husband and friends supposed, she died on the second day after her relapse, about two o'clock in the afternoon. The usual formalities of stretching and laying out were gone about—her husband procured money from his employer, and ordered mourning for the family. Next day about twelve o'clock, as the wright was taking measure for her coffin, she gave a sneeze, and otherwise made a stir with her body. On taking off the grave-clothes, she looked up in a wild manner, and made a motion with her hand as if she wanted something to eat. A few cordials were administered to her. She was then put to bed, and enjoyed a good sound sleep. She has since gradually recovered, and is now considered quite out of danger.—*Glasgow Chronicle.*

A preacher hearing the cry of an infant among his congregation, commanded that it should be removed—observing at the same time, that a crying child in a place of worship, was like the toothache—there was no cure but having it out.

The Summer Complaint.—For this dangerous and distressing complaint, a decoction of common Ground Ivy, is a certain and almost immediate remedy. On Tuesday morning, a little child of two years old was violently seized by this complaint—its mother gave it ground ivy tea (taken cool) plentifully throughout the day; and next day we saw the child as well and as playful as ever.—*N. Y. Courier.*

Children.—If you have children, keep them for a month or two on bread and milk. You should always keep them so—but especially at this time. Milk is a sworn enemy to the physicians, while meat and coffee, and green corn, and withered peaches (of which we have an abundance this year,) are their disciples.—*Conn. Mirror.*

COUNTRY SCHOOL KEEPING.

MR. PRINTER—Did you ever teach a school? If you ever have, I guess as how you had a little rather set types, for it is a solemn fact, that the schoolmaster of a country village is the most miserable being on earth. Though I never had the misfortune to be engaged in that profession, I not long since visited the school of a friend of mine in the country, and if there ever was anything which could approach a description of Bedlam, it was this school. I had just got fairly scared, when up jumps a young Bedlamite, with "Marster, de House keeps er pinchin ma." "Jo, did you pinch him?" "No, I say I didn't, so now come, 'twas Bill Grimes, for I seed him when he did it." "Bill, what did you pinch him for?" "Koz he keeps er crowdin." Then follows a severe flagellation. Soon a class of little ones is called up to read, and by the way, be it understood, my friend the master was in the habit of squinting. "What is that?" "Thath, A-er." "Very well, what is the next?" "Ideno thir." "That is B, you blockhead." "B-er." "What is that?" "Ideno thir." "What do I do when I look at you?"—"Thupint-er." "Master, Tom Bogues keeps makin me laugh, he-he-he." "Tom come here—did you make him laugh?" "No sir." "Well, take your seat." "Master, maint I gwon to get

smink." "No, you will all go out directly." "The class in the spelling book stand up to read. Ze-kiel begin." "B-a-k-r." "The next." "S-a-g-a-r." "What does that spell?" "Ideno sir." "What does your mother put in your tea?" "Lasses-er." "The next." "Marster, maint I gwout ter get snice, to put in my trowis, to keep my nose from bleeding?" "Yes, but come right in."—"S-t-a-i-r-s." "What does that spell?" "Ideno sir." "What do you go up to your chamber on when you are at home?" "Larder." "No, you stupid fellow, stairs." "Marster, maint the boys go out?" "No. The first class stand up to spell. Spell Dictionary." "Dick die t-i-o-u-g-h-l-n r-e-i-g-h-r-y—Dictionary." "Marster, Jim Stokes keeps all the time squirtin spit at me." "Well, Jim, you must stop after school. Spell Phthisik." "P-p-p-t-i-h-i-c-k—tlick." "Master, maint I speak?" "What for?" "Koz I want to berry that are strate ruler, what Tony Lumkins got."—"No, keep your seat." Thus my friend, and his pack of noisy urchins wiled away the time until the usual intermission.

DANDIES to make a greater show,
Wear cents stuck out with pads and puffing,
And this is surely apropos,
For what's a Goose without he stuffing.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturalists in the vicinity of Boston and New York, is just published by J. D. RUSSELL, Proprietor of the New England Farmer. The articles are arranged alphabetically, and comprise the most useful VEGETABLES and FRUITS which can be conveniently and economically cultivated in the climate of New England and the Middle States; as well as a Treatise on FLOWERS, and on LANDSCAPE or PICTURESQUE GARDENS, on the general management of the SILK WORM, and the manufacture of SILK, and a Treatise on the culture of GRAPE VINES and the STRAWBERRY. The article on Fruit Trees contains an enumeration and description of all the Apples, Pears, Peaches, Cherries, Plums, Nectarines, Apricots, &c. &c. that can be raised to the most advantage, and their relative forwardness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written.

A list of the contents of the work will be found in the New England Farmer for August 1.

Price \$1.25—Six copies for \$6.00.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres, of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D." Boston through the post-office. 6t Aug. 1

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of seeds, assorted, suitable for that market, at from \$4 to \$5 per box—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the great variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Onions for Sale.

Six hundred bushels of prime Onions, (White, Portugal, and Stray Coloured) raised by a gentleman in this vicinity, are offered for sale, to traders and others, by the bushel or barrel, on very advantageous terms. Enquire at the New England Farmer Seed Store. Aug. 29

Orchard Grass Seed—growth of 1828.

Just received at the New England Farmer Seed Store, No. 32 North Market Street.

20 bushels of prime Orchard Grass Seed, raised, this season, with the greatest care, by John Prince, Esq.—warranted to be equal in purity to any ever offered for sale in New England.

A supply of pure Gulman Wheat, raised by Payson William, and Mr. Winchester, is daily expected.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPTEMBER 19, 1828.

No. 9.

AGRICULTURE.

(By the Editor.)

IMPLEMENTS OF AGRICULTURE.

Every good husbandman will lay it down as a rule, to have an inventory of all his agricultural implements, and other articles, necessary for the cultivation of his farm; and frequently inspect them, that he may be sure that the requisite repairs are made in due time. An implement, likewise, that is not longer wanted during the season, ought not only to be carefully housed, but before it is put aside, it should be well cleaned, rendered perfectly dry, oiled, or, if made of iron, painted, and kept so as to be ready when wanted.

Sir John Sinclair observes that no circumstance marks more the character of an attentive husbandman than great attention to his farming implements. Upon every farm, also, there ought to be one or more places, properly constructed, for holding the larger implements; and some secure place allotted, for containing the smaller tools. Where machines are necessarily exposed in the field a great part of the season, they require to be new painted at least every second year. This defends them, not only from drought but also from rain and rust.

The introduction of new implements into a district is often a matter of great difficulty, owing to the ignorance, the prejudices, and the obstinacy of farm servants and labourers. Many farmers, therefore, very absurdly retain their old implements, though convinced of their inferiority, rather than sour the temper of their labourers by attempting to introduce new ones. In several cases, however, by attention, perseverance, and by rewarding those servants who have been induced to give the new machines a fair trial, they have succeeded in the attempt.

The importance of proper implements is such that the melioration of those in use would be an essential advantage to agriculture; and great as are the mechanical improvements which have been already made, many of them are capable of being brought to still greater perfection. Persons of genius and experience, therefore, ought to be encouraged to devote their time and attention to this important object; and to exert themselves, either to improve the various sorts of implements now in use, on scientific principles, or in the invention of superior ones, as circumstances may require. The discovery of an useful implement, by which the labours of agriculture can be abridged, or brought to a still higher degree of perfection, and the expense of cultivation at the same time diminished, cannot be too much encouraged, as likely to prove of essential service, both to the farmer, and to the public. It is calculated indeed, that an immense advantage would accrue, from even the general adoption of the improved implements now in use in particular districts. Mr Curwen is of opinion, that the farmers in the southern counties of England, lose at the rate of 25 per cent. by the heavy carts and wagons they employ; and there can be no doubt, that the introduction of two-horse ploughs and threshing machines, where these implements are unknown, would les-

sen the expense of labor at least 10 per cent. more.

GENERAL RULES FOR THE CONSTRUCTION OF FARM BUILDINGS.

In constructing farm buildings the following rules should be attended to.

Though a circle contains most space within the smallest possible inclosure, yet with few exceptions, it is the least adapted for subdivision, and the most extensive in execution; while the square, and parallelogram, will be found the least costly, and the most commodious.

In low buildings, where the roof and joisting are the most expensive articles, the oblong form will be preferable, particularly when such a form is, in other respects, best adapted to the purposes required.

The cheapest buildings are those whose plan is contained within four straight lines. All projections add considerably to the expense, by the extra corners, breaks in the roof, &c.

WATER IN FARM YARDS.

The author of Husbandry in Scotland, is of opinion that when cattle are fed in winter on dry food, as hay or straw, no expense should be spared in supplying them with a sufficient quantity of water. It has been ascertained, that a horse, when feeding upon straw, having water at command, will drink of it eight times a day; hence it is evident that he cannot get enough, if only driven twice a day to an adjoining stream or pond. It is therefore, advisable, where it can be done, to bring water into a cistern in the fold-yard, to which the cattle may go whenever they are in want of it. The cistern may be made of rough masonry, and consequently would not be expensive. There can be no doubt that cattle would improve much more rapidly, more especially on coarse fare, when thus supplied with water, than if they were only occasionally driven to it.

GRATER CIDER MILL.

Of the multitude of new inventions which the ingenuity of our countrymen annually brings forth, it is unquestionably true that a considerable proportion are of but little practical utility, while others entirely supersede the modes by which the same effect was before produced. Among the latter, we have no doubt, the new "Grater Cider Mill" is destined to be ranked. We examined it last fall, and saw its operation, and are satisfied that the saving made by it, both in the power required for propelling it, and in the rapidity of execution, is very great. The apples are ground, or rather grated, very fine, so that all the juice may more readily be pressed out, while the seeds are left whole, so that they do not communicate their bitterness to the liquor. We therefore do not hesitate to recommend it to the public, and thus we do entirely from our conviction of its utility, and without the solicitation of any person whatever.—*Mass. Spy.*

Hale's Restorative.—It has been ascertained that the daily application of salt will restore hair to the heads of those who, from fever or other causes,

may have suffered its loss. The constant application of salt has been found to give strength and luxuriance to hair which was falling off, and causing rapid baldness. This is a simple and cheap remedy worth trying.—*Domestic Encyclopedia.*

FOR THE NEW ENGLAND FARMER.

MR. FESSENDEN—I have lately been in the county of York, Me. where a number of your subscribers—who are not half so numerous as they ought to be, for their own advantage—are desirous of obtaining information on the following subjects:—The best mode of making a syrup and a wine of the elder berry juice; The best season and mode of transplanting our native forest trees and shrubs for ornamenting the grounds about houses, roads, &c. Any information you may find it convenient to communicate on these topics, will be gratefully received, I doubt not, in the county of York, and certainly by a subscriber in Massachusetts.

By the Editor.—We are happy to comply with the request of our respected correspondent to the extent of our information, and would be obliged to friends and well wishers to the objects of our establishment to send any notices relating to the topics of his inquiry.

The following recipe is transcribed from the *Am. Med. Dispensary*. It was originally taken from an English publication. We have never had a trial of it, and cannot vouch for it, though I have no objection to doubt its correctness.

Wine of Elderberry Juice.—One bushel, when picked from the stalks, produces three gallons, or upwards, of berries; put these to seven galls. of soft water; after standing forty-eight hours, put them into the copper, let them boil one hour, then press the juice through a coarse cloth; then put the liquor into your copper again, with twenty pounds of raw sugar, half a pound of Jamaica ginger, bruised, one ounce of cloves, and one ounce of allspice. Boil the whole together one hour, then put it into a tub, and, when cold enough, add some good yeast spread on a cloth, and in two days put it all into a cask, and lay the bung lightly on for two months; then add one quart of brandy; this wine will keep for several years.

With regard to making a syrup of the juice of the elder-berry, we have seen no prescription but presume that the process is very simple. Willich's *Domestic Encyclopedia* says, "The berries [of the elder] are poisonous to poultry; but their juice being boiled down to an extract, and sweetened with sugar, (this composition being termed *rob*), is a gentle aperient, and promotes perspiration."

With regard to forest trees, we shall give some directions from authors of established reputation.

M. Mahon says, "Evergreen trees and shrubs may be planted with good success any time in March, in most of the Southern States; but in the Middle States it should not be attempted before the last week therein, nor in the Eastern States before the beginning or middle of April; these kinds are always most successfully planted when done immediately before their respective veg-

operation commences, which is a rule that ought to be carefully observed."

"The first thing in transplanting trees," (says an English writer,) "is, to have the ground prepared before the trees are taken up, that so they may remain out of the earth as short a time as possible; the next is to take up the trees. In doing this, carefully dig away the earth round the roots, so as to come at their several parts to cut them off: for if they are torn out of the ground without care, the roots will be broken and bruised to the great injury of the trees. When you have taken them up, prepare them for planting by pruning the roots and heads. All the small fibres are to be cut off, as near the place from whence they are produced as may be, excepting perhaps when they are to be replanted immediately after they are taken up. But it will require great care to plant them in such a manner as not to distort, or entangle the fibrous roots, which, if done, will be worse for the plant than if they were cut off. Then prune off all the bruised or broken roots, all such as are irregular and cross each other, and all downright roots.

"The next thing is the pruning of their heads. If the trees are designed for standards, you should prune off all the small branches close to the place where they are produced, as also irregular ones, which cross each other; and having displaced these branches, you should also cut off all parts of branches close to the place where they are produced, as also irregular ones, which cross each other; and after having displaced these branches, you should also cut off all such parts of branches as have by any means been broken or wounded; but by no means cut off all the main leading shoots, which are necessary to attract sap from the root, and thereby promote the growth of the tree.

"Having thus prepared the trees for planting, you must now proceed to place them in the earth. But first, if the trees have been long out of the ground, so that the fibres of the roots are dried, place them eight or ten hours in water, before they are planted, with their heads erect, and the roots only immersed therein, which will swell the dried vessels of the roots, and prepare them to imbibe nourishment from the earth. In planting them, great regard should be had to the nature of the soil: for if that be cold and moist, the trees should be planted very shallow; and if it be a hard rock or gravel, it will be better to raise a hill of earth where each tree is to be planted, than to dig into the rock or gravel, and to fill it up with earth, as is too often practiced, by which means the trees are planted, as it were, in a tub, and have but little room to extend their roots.

"The next thing to be observed, is, to place the trees in the hole in such a manner that the roots may be about the same depth in the ground as before they were taken up: Then break the earth fine with a spade, and scatter it into the hole, so that it may fall between every root, that there may be no hollowness in the earth. Then, having filled up the hole, gently tread down the earth with your feet, but do not make it too hard, which is a great fault, especially if the ground be strong and wet.

"Having thus planted the trees, they should be fastened to stakes driven into the ground, to prevent their being displaced by the wind, and some mulch laid on the surface of the ground about the roots."

In "*Memoirs of the New-York Board of Agriculture*," vol. ii. page 27, it is remarked, that "All evergreens are transplanted with difficulty. But Judge Masters, Dr. Hammond, and some others, have succeeded very well with the balsam, (*pinus balsamifera*.) white pine, (*pinus strobus*.) pitch pine, (*pinus rigida*.) all the spruces, (*pinus nigra*, *alba*, and *fraseri*.) &c. Those who have succeeded best, have been careful to avoid bending or distorting the roots. They cut off the roots carefully at the distance of one or two feet from the main stem or trunk, and take up the trees without pulling, or otherwise applying any force to them. They keep the roots moist, at least prevent their drying, until they are set in the ground. This they do either by retaining the soil on the roots, or by covering them with wet moss, wet cloths, &c.

"They avoid wounding the body and limbs; and never cut off a limb until at least one year after transplanting. Whenever they prune evergreens, they cut the limbs four or five inches from the body of the tree, and leave the remainder to wither or die before taking it off closely. They advise to cover the wounded part with some kind of adhesive paste.

"In selecting evergreen trees, care should be taken to procure those which have grown up in open, exposed situations. And, if convenient, they ought to be taken from a soil similar in quality and state of moisture or dryness, to that in which they are to be set."

FOR THE NEW ENGLAND FARMER.

GRAFTING VINES AT THE ROOT.

MR. FESSENDEN—I was much gratified by your republication of the letter of Mr. COXE, of New Jersey, on the propagation of the Grape by grafting on the roots. Few men in our country are entitled to higher respect from horticulturists, than Mr. COXE, and every thing which comes from his pen is worthy of notice. He is right in saying that none of the European cultivators enumerated by him, none of the standard works on horticulture, have given even an intimation of the perfectly safe and sure mode of grafting vines on the roots of other vines. But, at the same time, it is true, that Mr. KNIGHT, President of the Horticultural Society of London, has suggested it as a secure mode, and some months before Mr. COXE's publication, having received some grape scions from him, I inserted them into the roots of other grapes. The process I adopted was exactly the same as that of Mr. COXE. I inserted them by cleft grafting, using no clay, but drawing up the natural soil about three inches above the insertion—out of five scions, four grew. It is a valuable discovery for our horticultural friends in the interior. They can always procure scions of the best grapes, and insert them in the roots of our native grapes, of which the country is full. The *Isabella* would make an admirable stock for the foreign grapes, and there is reason to hope that the more delicate grapes would flourish better on our native vines, and probably be more hardy, than on their own roots.

This, however, is only speculation—experience will decide. A correspondent of yours inquires as to the mode of grafting grapes on the stalk or stem. This, from my experience, is not a very easy or successful process; but the late Mr. PREBLE was often successful in it. I have repeatedly tried it, and failed. During the present year, I

have succeeded. I attribute the failure in former years to my inserting the graft too early. If the scion is kept in a cool place, till the vine has shot into leaf, I find the success almost certain. Your correspondent requests particular directions as to the mode. I will state my own method, derived, however, from European authority. There are several methods recommended by French writers. The two which I adopted were the following, and both succeeded:—

One is, to split the stalk of an old grape vine of two years growth, by a sharp knife, four inches in length, and to insert wedges to keep the slit open—then prepare a scion, pared to a wedge form at its two ends, and also pared to a wedge form throughout its length—one eye only should be inserted. As soon as the pegs which keep the split open are withdrawn, the wood will embrace with great force the scion. Bind it with matting, or with woollen yarn, then either cover the whole except the eye with clay, or, as I prefer, with a resinous compound of rosin and beeswax. I have succeeded in this mode, but I prefer another.

Take a scion with one eye only, four inches in length—leave about an inch above the eye, and three inches below it—pare away about half the thickness of the scion, having cut the lower end square—then make a corresponding cut into a grape shoot of exactly equal size, terminating in a square shoulder, upon which the scion will rest, and which it should exactly meet—secure the scion to the stalk by a bandage, and cover it as in other grafting.

It will be perceived that in both these modes the main stalk is not cut off, continues to grow, and will not feel the wound if the scion does not take. If it takes, and is healthy, then cut off the stalk immediately above the insertion, and you will have fruit perhaps the next year.

Still the operation is a doubtful one, and I think the root grafting will eventually supersede it in this country and in Europe, except in cases where we wish to change the fruit of a vine already introduced into a grape house.

JOHN LOWELL.

Roxbury, Sept. 15, 1828.

To nursery men, it seems to me, the practice of root grafting affords some facilities which they have not yet enjoyed.

FOR THE NEW ENGLAND FARMER.

THE LONG RED POTATO.

MR FESSENDEN—There was an inquiry directed to you by M. of Wrentham, dated so far back as Jan. 2d 1827, to ascertain when, and from whence, the long red potato was introduced among us. It would have been some gratification to have had light thrown on the subject, in as much as this kind of potatoes has been gradually improving in quality, and increasing in estimation, as it has got better naturalised to our soil and climate, and has got to be better known among the consumers. But I do not recollect to have seen any notice taken by any of your correspondents, of said inquiry. I will, therefore, tho' at so late a period, offer the following as a fact well known to me. About twenty-three years ago, the late ISAAC DAVENPORT, Esq. of Milton, in the fall, went to Rhode Island in quest of young fruit trees. There were then but few nurseries near Boston, and he was directed to a quaker, where he suited himself. But the day being far

gone, he accepted an invitation to spend the night there, and found his host to be an intelligent and careful farmer. In the course of the conversation he was informed that two years before, the Quaker being on a visit to some of his friends on North river, brought from thence some of the said long red potatoes, which were a new article among them, and which he highly praised to Mr DAVENPORT, as being extraordinary great bearers, and much liked by the cattle; and he agreed to let him have a small quantity for seed. On his return home, Mr DAVENPORT, sent to that place, one of his neighbors, Mr EBENEZER FISHER, a native of Sharon, and a very clever man, who bro't to Milton a horse waggon load of them, which was divided amongst a few neighbors. They gave a very great crop, but were unshapely, branching out in numerous limbs, and watery, yet the cattle and hogs appeared exceedingly fond of them. Since that time their cultivation extended round to Dorchester, Dedham, and other neighboring towns, where before they were not known. It is probable that in other districts of the commonwealth, distant from Rhode Island, they may have been introduced from some other quarter; and it would be pleasant, and tending to usefulness, to have any facts stated, which might illustrate the subject.

Formerly every new introduction or improvement, was the result of individual enterprise and exertions, and circulated slowly, circuitously, and, as it were, by chance. In these, our more favored days, the numerous agricultural associations bring men and knowledge to one focus, hence the rapid circulation of every fact tending to general usefulness.

There is no root crop that has gained so universal estimation, as the long red potato, although they yield less at present than they did when first introduced. But the quality has greatly improved, and their shape has become more correct in our New England soil. It is a fact which must have met the observation of every farmer, that when the first frost comes in fall, it kills the green leafy vines of the long red potato, whilst the other sorts have generally decayed before that time; hence we must conclude that the long red requires a longer period to grow, and come to that full maturity, which is surely indicated by the decay of the vines. If they are destroyed by the frost whilst green, it is evident that the ultimate growth of the potato is stopped. It goes down to the cellar to complete its maturity, which does not take place until spring, and then very imperfectly. It deprives therefore the long red of the high repute which it is due, and this injury might be prevented, to the great benefit of the farmer, by planting them earlier. They should be planted as soon as they would be safe against frost, which would give them time to get perfectly ripe. There would be then no reason to complain that the ends eat watery, the whole potato would eat alike dry, mealy, and mature, and be the finest potato for the table. From fall until July, there is more substance and body in the long red than in any other potato, hence it goes further for food, and is more profitable whether for the table or for the use of the barn. If rightly boiled, there is none so mealy. Although the shape of the long red is more regular now, than it was formerly, it has yet a tendency to branch out, but I conceive that this defect will get entirely corrected in the course of a short time, provided we take care never to plant it branch-

es, but only the main body of the potato, or such as have no branches.

It is a matter of surprise that many farmers should deem it of little importance what potato seed they plant. They are very particular for the Indian corn seed, to select the finest ears, and take the grain of the middle part of the ear, as being the most ripe and the best shaped. For small grain they also choose the best and dress it carefully so as to exclude all the light grain, but for potatoes, any thing but the smallest, is by many used for seed, and it cannot be a matter of surprise that under such management, the sorts should run out; and that it should become needful, once in a while, to change seed. *The reasonableness of using the handsomest and best potatoes for seed*, is as evident, as to choose the best corn for planting.

I have myself always thought it my interest to plant no potatoes, but the best for size and shape; when very large, I have cut them in pieces with no less than three eyes. I have blues, yellows, and long reds, which I have planted for about ten years, and which have much improved, especially the blues and reds, of what they were, when I first had them.

The introduction of the long red potato is not the only benefit which agriculture has to acknowledge from the late Mr. DAVENPORT. Few men understand so well the management of fruit trees, as I few farms in the neighborhood of Boston are so abundantly and profitably stocked as his, with the best fruit, and with trees so healthy and well trained. He disseminated freely the results of his knowledge and experience in all his neighborhood, and the farms near the Blue-hills in Milton exhibit orchards and nurseries not to be excelled in any part of the country. All who had the pleasure of Mr. DAVENPORT's acquaintance, will delight to honor his memory, for he was a good citizen, a good friend, and an excellent farmer.

Weston, Sept. 17, 1828.

J. M. G.

MILK PAINT.

MR FESSENDEN—I think your correspondent, in yours of Sept. 12, has taken a too favorable view of milk paint. This is a revival of a subject on which some French chemists indulged opinions, which to say the least, were hardly realised.

It is now nearly 20 years, since a small pamphlet was published by a zealous friend to improvement, giving the materials, viz.

Resin, or Turpentine,
Oil, Lime, &c. with skimmed milk,
&c. Oeher, &c. to give the color.

It was so urged and well set forth, that I engaged in the process with more confidence than I found a support for. Having used these materials for several buildings, and carefully prepared it too, under my own eye, I was, I must own, disappointed. The effects were of too short duration to encourage further experiment.

The application of this then new principle, was adopted in Connecticut (the pamphlet being circulated there) as to some public buildings, and the effect was not, I understand, to the satisfaction of the parties.

If so cheap a substitute for oil painting could be had, it would be a great benefit, extending a neatness of appearance through the country. But I fear from some favorable appearances, too partial views of its durability are entertained by your ingenious correspondent.

PRESERVATION OF MELONS, &c. FROM BUGS.

MR FESSENDEN—I have found it almost impossible to raise melons on my grounds, and I was much pleased to learn last week from a person in Northampton, that "melon seed soaked 24 hours in a decoction of tobacco, will be effectually protected from bugs." My informant has so prepared seed for many years, and assured me that it was a complete prevention.

A. M. T.

N. B. Don't forget the above next spring.

CULTIVATION OF FRUIT TREES.

When it is considered that a bushel of peaches can be raised at less expense than a bushel of potatoes, and that pears are as easily cultivated as apples and are more certain to bear every year, it is not a little remarkable to see peaches selling at the rate of two dollars a bushel, and pears at from a dollar to a dollar and a half, as has been done in this place for the week past, and they have found a ready market at those rates. This being the case, it is worth the inquiry why good fruit is not more generally cultivated. We apprehend the principal reason is the prevailing habit in the country, of considering a man's right to his fruit as less sacred than it is to his other property.—Even among many who would revolt at the idea of taking and carrying away fruit without leave, a notion appears to prevail, that the man who has good fruit is but little more than a steward over it, to see that it is properly distributed among his friends and neighbors, all of whom are considered as having a right to a share of it. We know a farmer who had a considerable number of valuable fruit trees, who cut them down, because the expense of giving away the fruit, and entertaining the company which it brought him, was greater than his circumstances would allow.

We have also known instances, where those who had good early fruit trees standing in exposed situations, have cut off the tops and grafted them with winter fruit, because their products were chiefly pilfered and carried away, so that the owner derived but little from them, except a plentiful harvest of vexation and trouble. Such a state of things ought to be corrected. The farmer ought to be considered as much entitled to the income derived from his fruit as his other crops and the pilferer from an orchard, ought no more to escape with impunity if detected, than he who pilfers from a cornfield or a granary. When this comes to be the case, and not till then, we may expect to see good fruit more general and abundant.

To bring about so desirable an object, those who could afford to give away fruit if they chose, should set the example of cultivating it for sale, both in the market and on their own premises.—Few would expect that to be given them which was offered for sale, and if any should pilfer what they might buy at a fair price, a public example should be made of them. Then others would be induced to engage in the culture, as a source of profit which might be depended upon. Some have already adopted this plan, and more we hope will follow their example.—*Mass. Spy.*

Mr. R. E. Hobart, of Pottstown, Montgomery county, Pa. an ingenious mechanic, has taken out a patent for the making of horse shoes upon a principle entirely new—by which it is said that one ton weight of horse shoes may be made in one day, by his machine.

SILK.

II. *Choosing the Cocoons for the production of Eggs.*

Continued from page 60.

About two ounces of eggs may be saved out of one pound and a half of male and female cocoons.

The small cocoons of a straw color, with hard ends, and fine webs, and which are a little depressed in the middle, as if tightened by a ring or circle, are to be preferred. There are no certain signs to distinguish the male and female cocoons: the best known are the following.

The small cocoons sharper at one, or both ends, and depressed in the middle, generally produce the male. The round full cocoons, without ring or depression in the middle, usually contain the female.

These may be distinguished from the dupons by the extra size, the clumsy shape, rather round than oval, of the latter. As, however, all marks may fail, an extra number may be kept, of the best of those which are spun double, and when the moths come out, the males and females being easily distinguished, an addition can be made from them to the defective side.

By shaking the cocoon close to the ear, we may generally ascertain whether the chrysalis be alive. If it be not dead, and loosened from the cocoon, it yields a sharp sound. When dead, it yields a muffled sound, and is more confined in the cocoon.

III. *Preservation of Cocoons intended for Seed, or until the appearance of the Moth.*

Experience shows that where the temperature of the room is above 73°, the transition of the chrysalis to the moth state would be too rapid, and the coupling will not be productive; if below 66°, the development of the moth is tardy, which is also injurious. Damp air will change it into a weak and sickly moth; the apartment should therefore be kept in an even dry temperature, between 66° and 73°. When collected, spread the cocoons on a dry floor, or on tables, and strip them clean of down or floss, to prevent the feet of the moth being entangled in it when coming out. While cleaning them, all those that appear to have any defect should be laid aside; this is the time, also, to separate the male and female cocoons, as far as we can distinguish them.

Select an equal number of males and females, and keep the cocoons of the same day's mounting separate, that the moths may pierce them at the same time. If the good cocoons taken from the whole parcel, are all first mixed, and the selection of those intended for breeding be made from this general heap, many will be set aside which were formed by worms that had mounted upon different days, and which will be pierced by the moths unequally, and hence there will not be an equal number of males and females produced at the same time; this irregular appearance may cause the loss of a great many moths, or of several thousand eggs.

When the selection has been made, the sorted cocoons must be put on tables, in layers of about two inches, allowing the air to pass freely through them, that it may not be necessary to stir them frequently; but it is beneficial to stir them round once a day, if the air be moist. When the seed cocoons are not very numerous, they may be strung upon threads, and hung against a wall, or suspended from a beam. Just so much of the middle of the cocoon is to be pierced with a nee-

dle as is sufficient to attach it to the thread. The middle is chosen, because it cannot be ascertained at which end the moth will pierce the cocoon.—Place a male and female cocoon alternately upon the thread, that they may be near each other when they come out.

If the heat of the apartment is above 73°, every method of diminishing the heat should be tried: such as keeping all the apertures to the sunny side carefully closed, to cause thorough drafts of air to dry the humidity that exhales from the chrysalides. Should the temperature rise to 78° or 82°, the cocoons must be put in a cooler place, as a dry cellar.

Seventh Age of the Silk Worm.

The seventh, and the last age of the silk worm, comprises the entire life of the moth.

The formation of the moth, and its disposition to issue from the cocoon, may be ascertained when one of its extremities is perceived to be wet, which is the part occupied by the head of the moth. A few hours after, and sometimes in one hour after, the moth will pierce the cocoon and come out; occasionally the cocoon is so hard, and so wound in silk, that the moth in vain strives to come forth, and dies in the cocoon. Sometimes the female deposits some eggs in the cocoon before she can get out, and often perishes in it; this circumstance has induced some to extract the chrysalis from the cocoon by cutting it, that the moth may have only to pierce its thin envelope; but the experienced Boudolo disapproves of the practice (although he has performed the operation with success), because it is tedious; and should the moth be put on a plain surface, five in a hundred will not be able to get out, but will drag the envelope along, and at last die, not being able to disencumber themselves. If the surface be not smooth, the moths will issue with greater ease; it is very favorable to the moths when they put forth their head and first legs, to find some substance to which they may fasten, and thus facilitate clearing out of the cocoon by the support.—For this reason, they should be spread out within on tables covered with a muslin or linen cloth. The life of the moth lasts, in Italy, ten, eleven, or twelve days, according to the strength of its constitution, and the mildness of the atmosphere.—With Mr. Dussar, of Philadelphia, the moths lived from five to eight days; a hot temperature accelerates their operations and the drying which precedes their death.—*To be continued.*

AGRICULTURE.

We understand that the price of wheat has lately experienced a considerable rise, and is now selling at Albany at 10s 6d the bushel. This change in our markets may be ascribed to an anticipation of short crops, in many parts of the country, in consequence of an unfavorable season. It appears by the late intelligence from Europe, that Great Britain and the continent, as well as our own country, have been visited by severe storms and floods, which will prove injurious to the harvests. From these causes, operating so extensively, it is not improbable that foreign ports will be necessarily opened, and the price of agricultural produce greatly enhanced during the present year.—*New York Statesman.*

The harvest has proved so short in Upper Canada, that the Lieut. Governor is about to prohibit distillation from grain.

GEOLOGY.

One of the most singular deposits of rock upon the earth is between Boston and Providence. It is an aggregate of pebbles of all sizes, from a foot or more in diameter to grains so fine that they cannot be distinguished by the naked eye. A cementing substance fills the spaces between the pebbles, and unites them into a mass, sometimes almost as compact as a piece of granite, but frequently so loose that it is easily separated, and even falls to pieces by exposure to the air and seasons. It is said that the ledges are of the coarsest texture near the surface, or on the highest peaks, and as a descent is made they gradually grow finer, and finally become a sandstone or perhaps a fine slate. The composing pebbles have smooth and rounded surfaces, evidently produced by attrition or rubbing against each other at some former period, and in some different position.

Perhaps the most unaccountable fact respecting this singular deposit, is the seams or fissures which divide the ledges in various directions, passing so straight and exact in their course, that they separate the smallest grains and leave the surface as smooth as if it was polished. The pebbles are quartz, felspar, argillite and hornblende.

The Catskill Mountains present a phenomenon bearing some resemblance to those already mentioned. The highest peaks of this range, which here and there tower above the rest, are composed of aggregates, resembling the coarsest masses deposited in the range from Boston to Providence, while the great mass of mountain on the declivity below resembles in its texture the finest portion of the other.

I mention the facts and leave them for others to explain.

This rock is called graywacke, and coarse graywacke is called pudding stone.—*Boston Patriot.*

We take this opportunity to remind our agricultural friends, that the 15th day of October next, is the day designated by the Executive Committee, of the Hartford County Agricultural Society, for the Cattle Show and Fair. The Committee having made the necessary arrangements, preparatory to this exhibition, all that is now wanting to give it an important character, is the exercise of a proper feeling among the friends of agriculture throughout the county.

We do hope that (this year) we shall not be behind our friends in the neighboring Counties.—We can have if we will, a rich and interesting exhibition. We have the means within our power.

In the exercise then of that noble spirit of emulation, so characteristic of the farmers in other sections of the State, do let us avail ourselves of them.—*Hartford Mirror.*

Cattle Show and Fair.—The season for our annual Cattle Show and Fair is fast approaching, and we doubt not the farmers have before this commenced their preparations for the occasion.—We learn with pleasure that several farms have been entered for the premium, and that the prospect generally of an interesting exhibition is very favorable.—*Hartford Courant.*

Honey a cure for the Gravel.—A gentleman cured this disorder by sweetening his tea with half honey and half sugar. Others have followed the same prescription with success.

CANALS AND RAIL ROADS.

We hope the following table will be thought worthy the labor it has cost us. We believe it embraces nearly all the canals and rail roads in the United States that have been authorized by law, and we have added a few that are not thus authorized.—*Vermont Chronicle*.

1. From Boston Harbor to Chelmsford. 2. Worcester, Mass. to Providence, R. I. 3. Northampton, Mass. to New-Haven, Ct. 4. Albany to Buffalo. 5. Albany to Whitehall. 6. Salina to Oswego, connecting the Hudson and Erie Canal with Lake Ontario. 7. Connects Seneca and Cayuga Lakes with the Hudson and Erie Canal. 8. From Delaware River, in Orange county, to the Hudson, near Kingston. 9. Easton to Newark, N. J. 10. Delaware River to Chesapeake Bay. 11. From Fort Deposit, on the Susquehanna, to the Maryland line. 12. Georgetown, D. C. to near Pittsburgh, Pa. 13. Cleveland, on Lake Erie, to the Ohio, at the mouth of the Scioto. 14. Cincinnati to the Maumee, near the

head of Lake Erie. 15. Stoddartsville, on the Lehigh, to Easton, on the Delaware. (whole distance 48 miles, but the canal as above.) 16. Mouth of Little Schuylkill River to coal mines.— 17. Lancaster to mouth of C. Creek. (slack water navigation.) 18. Philadelphia to Mount Carbon. (canal and slack water.) 19. Reading to Middletown. 20. Middletown to Pittsburgh. (The three last form a continuous line from Philadelphia to the Ohio at Pittsburgh. No. 20 has been commenced at both extremities. It is thought that a rail road will be substituted for crossing the mountains.) 21. Pittsburgh to Erie, on Lake E. 22. Philadelphia, to meet Delaware and Hudson Canal. 23. Richmond to the Kenhaws. 24. Near the mouth of James River to Albemarle Sound. 25. Near Louisville, Ky. to pass the rapids. 26. Canals and slack water on Cape Fear River. 27. From Columbia, by means of the Broad and Saluda Rivers, to Cambridge; and from the Santee, by Cooper's, to Charleston. 28. Savannah to the Altamaha. 29. 30 To connect the Atlantic Ocean with the Gulf of Mexico. 31. Between Lakes Erie and Ontario, on the Canada side.

From the American Farmer.

SWEET BUTTER.

The component parts of milk are oil, curd and whey. The oily parts constitute the cream, and the curd is the cheese. The oily parts, being specifically lighter than the other parts of the substance, ascend to the surface in the form of cream.

In winter, four or five days, according to the common practice, are necessary to produce all the cream of a pan of milk. Such cream from this tedious process not infrequently acquires a bitter taste, which is entirely ascribed to the butter. And the churning of butter from such cream is moreover an operation of four or five hours, and sometimes longer unless hot water be poured into the cream, which invariably injures the butter, by rendering it white and insipid.

To shorten the time, and to diminish the labor of making butter, and at the same time to improve its quality, there has been recently established in the dairy house of Mr. Ro. Smith's farm, called Orange, an apparatus upon the simplest principles imaginable. During the coldest weather in winter, in the course of less than twenty-four hours after the milk has been taken from the cows, sweet cream is produced, greater in quantity and richer in quality than can be obtained in the ordinary management in five days. No rich, indeed, is the cream, that it is churned with as much facility as is the rich cream of the Alderney cows, in the summer season. The operation of churning never exceeds twenty-five minutes. The butter from such cream has never failed to be of a fine flavor and of a fine color; and in the nature of things it never can fail to be so, unless the dairy woman should be utterly ignorant of the art of making sweet butter. The process is not a new invention. According to the principles of the system pursued at Orange, is made the sweet butter which, in England, is the most admired.—The part of the course of proceeding not in common use is this:—The pans, with the milk just taken from the cows, remain until a thin skin of cream is produced. They are then placed in hot water, and in about thirty minutes thereafter all the cream contained in the milk is formed on the surface. The cream thus obtained is managed as other rich cream is in all well conducted dairies.

The principal merit of the apparatus at Orange, is the great facility of heating the water, the convenient fixture of the vessels containing the same, and the complete exclusion of every particle of the smoke of the fire.

The skimmed milk, consisting of curd and whey, without any of the buttery parts, has a peculiar sweetness, is extremely pleasant to the taste, and is deemed a very wholesome beverage.

With this apparatus, butter can be made in summer as in winter.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 19, 1824.

FARM BUILDINGS.

The first object when a new set of farm buildings is to be erected, is to fix on a proper situation, which ought to be as near as possible to the centre of the farm, more especially if it be arable. Nothing can be more preposterous, than to continue the old system of having the farm-house placed in villages, totally detached from the farm; a plan which originated from the want of domestic security in feudal times, or the dread of foreign invasion. If the farm buildings are placed out the corner of a large farm, a part of the land will probably be neglected—less manure will be sent to it—the expense of cultivation will be materially increased—the strength of the horses or oxen will be uselessly wasted in going backwards and forwards; and the remote parts of the farm will be left in a state of miserable pasturage; or when occasionally broken up, the crops will necessarily be inferior to what they would have been, under a different system.

It is sometimes assigned as a reason, for not having the farm-houses and offices in a central situation, that at another part of the farm, a better command of water can be procured for family use, and for the farm stock, or for driving a threshing mill, by which a great saving in the labor of horses or cattle is secured. That, however, is only an exception to the general rule, for it may be laid down as an axiom, "that the farm-house and offices ought to be placed, as nearly as possible, in the centre of a farm."

Where the circumstances of the case admit of it, the farm-house should front the south; for by this means it is less exposed to the cold northerly winds. The farm-steed should be placed on a well aired and dry spot of ground; and, if it can be had, an elevated situation is always preferable. This is not only the most conducive to health, but an advantage of considerable importance is obtained, namely, it puts it in the power of the farmer, to see what is going forward in every direction. Where the house, on the other hand, is built in a low and humid spot, the crows of the occupier, however dry and well conditioned when brought from the field, will soon acquire a softness, and perhaps mustiness, very injurious to the value.

In the construction of the dwelling-house, utility and not ornament ought principally to be kept in view. At the same time every builder of taste, in fixing on the site and plan of a new farm-house, and out buildings, ought certainly not entirely to overlook the embellishment of the country. It is disputed, whether the house ought to have either wings, or a lean-to behind, or whether the whole should not be under one roof. Many think that a house of three stories, the kitchen half sunk, is

the driest, the cheapest, and the most convenient. Others prefer having the kitchen in a wing, attached to the house.

A farm-house ought not only to be convenient, but should have such a degree of neatness and uniformity that an idea of comfort and happiness may be given. It should have a little plat of garden ground or shrubbery either before or behind it. In the latter case it is placed more distant from the effluvia of the dung-hill. In the former the out houses, laborers, and cattle are more immediately in sight. The windows should be large and the sashes placed rather nearer the outside of the wall than is usual; because, if wet, they will in that case, sooner become dry. The house should be at a moderate distance from the other farm buildings, not only for the sake of purer air, but that the risk of setting the buildings on fire, by sparks from the chimneys of the house may be avoided. This is another argument in favor of placing the garden between the house and the farm buildings.

Many an industrious farmer has obtained the character of being a bad husbandman, from having been unguardedly led to exhaust his capital so much on buildings, as to disable him from applying an adequate proportion of it to the purchase of proper stock or to the cultivation of the soil. And it may be laid down as a maxim, that though a farmer is well entitled to accommodations, in proportion to the size and produce of his farm, yet to erect these on a larger scale than circumstances require is wasteful prodigality. Above all, increasing the expense by making ornamental erections cannot be too cautiously avoided.

PROFITS OF GARDENING.

It is stated in Berk's Report, that near Devizes, and other towns in Wiltshire, (Eng.) many families subsist by occupying from two to five acres as garden ground. The soil is sandy, and applied to the produce of esculent vegetables for the consumption of the neighboring towns and villages. So productive are gardens, when well managed, that three brothers, who followed the art of gardening, supported as many families, very decently, and gradually acquired some wealth, by the cultivation of about five acres of land.

SOAPER'S WASTE.

Sir John Sinclair asserts that soaper's waste used in moderation by itself, or in a compost with earth, is an excellent manure for garden soils.—This substance not only destroys insects and their larvae, but consisting principally of calcareous matter, every species of vegetables is greatly improved in quality, where it is applied.

FARMER'S GARDENS.

A garden, under a proper system, is a most valuable acquisition to a farmer, with a view both to comfort and economy. Many culinary articles may be obtained from a well cultivated and sheltered garden, which cannot be raised in the field, or will not grow in exposed situations, with equal luxuriance and perfection. Attention, likewise, should be paid to the sowing of different articles at various seasons, by which an earlier and a more equal as well as more regular supply for the table, may be obtained. It is also of use to employ a piece of ground in a garden, for raising cabbages, Swedish turnips, and other plants to be afterwards transplanted into the fields. The refuse of the garden may be given with advantage to pigs, and milch cows. At the same time, work-

ing in the garden should always be considered as of inferior consideration to the business of the farm; and on no account ought the farmer's attention to be materially drawn off from his crops of grain and grass.

SEA WEED A MANURE FOR ONIONS.

Sir John Sinclair says "Sea weed, where it can be procured, is an excellent manure for garden crops, in particular for onions." And in the *General Report of Agriculture in Scotland*, vol. ii. page 94, it is observed that "When sea-weed could be had at Kirkcaldy, at a reasonable rate, the crops of onions were remarkable for their produce."

YOUNG FRUIT TREES.

Sinclair says, it cannot be too strongly inculcated, that to permit young fruit-trees to bear fruit, for some years, is eventually to do essential injury to their future fruitfulness and duration.

CULTIVATING A GARDEN WITH A PLOUGH.

Field gardens cultivated by the plough are mentioned by Sir John Sinclair, who says in substance that there are not less than 8000 acres in all, cultivated in the neighborhood of London, principally by the plough instead of the spade.—A garden cultivated in that manner in y contain an acre with advantage. By substituting the plough for the spade, the work will require less attention; the necessity of having a professed gardener accustomed to digging will be prevented, and a considerable expense saved.

BANKING UP HOUSES.

The best mode of banking up houses, so as to keep frost from cellars, and render the lower rooms warmer than they would be otherwise, is to set single boards on edge, parallel with, and about a foot and a half or two feet from the sills or sleepers of the house—and fasten them in that position by pins or stakes, driven into the ground. Fill in a layer of dirt between the boards and sills, and over that place a layer of straw or other litter. Then place boards flat-wise, or nearly horizontally, descending a little from the house so as to shed rain, and carry it over the boards placed edgewise as stated above. The straw or litter will effectually prevent the frost from penetrating your cellar to spoil your vegetables. Next to a smoky house, and a scolding wife, a freezing cellar is earnestly to be deprecated, and if possible, avoided.

SUMMER-MADE MANURE.

Many cultivators waste nearly all the manure, which their cattle make i. the summer time by mismanagement. Their cow-yard is large, and the droppings of their cattle are spread in thin layers over a large surface. Of course they are first dried through and through by the sun, and secondly, washed away by the rains. Cattle should be yarded in summer in a small space. Their manure, once or twice a week, at least, should either be ploughed in or mixed with soil, for compost—placed under cover—shovelled into heaps and covered with earth, or in some way secured against the robbery of the elements. A farmer would be thought crazy, who should expose his cattle-fodder to the weather for months, before he made use of it; and he cannot be in his right mind, if he suffers his manure, (which is the hearts-blood of agriculture) to be sucked up by the sun—drizzled away by the rain, or tossed about by the four winds of heaven.

LOCUST TREE INSECTS.

A gentleman has sent us (preserved in spirits) an insect, found in the locust tree. It is the well known destroyer, for whose extirpation the Mass. Agri. Society have offered a premium of fifty dollars. It is described at length in the Mass. Agri. Repos. vol. v. page 67, and drawings of the insect, showing its appearance in the several stages of its existence are there given. By the writer of the article referred to the insect is denominated *Cossus robinia*; and the following is a part of his description: "The general color of the larva is red, approaching that of the cherry, paler towards the sides, deeper towards the middle of the back, and in each segment there are several tubercles of a reddish chestnut color, from each of which arises a small bristle. The under side of the body is paler, and of a dull white, very slightly tinged with red. The head is chestnut colored, the teeth very dark, and almost black. It has sixteen feet, or eight pairs. Three pairs of these are placed in the three first segments of the body; these are terminated by a single claw, as in all caterpillars. Four other pairs are placed in the 6th, 7th, 8th, and 9th segments and the 8th pair in the last division of the body," &c.

The writer of the article from which the above is extracted suggests no remedy for the ravages of the insect. But the New England Farmer, vol. iii. page 382, has the following remarks on the locust tree borer: "A horticulturist tells us that he has preserved his locust trees against the borer, which has almost annihilated that fine tree in this part of the country, by first probing the holes made in the tree by the insects with a small flexible wire, a little hooked or curved at the end, introduced into the tree. With this he destroys or extracts as many worms as possible. He then with a small syringe, injects into their holes strong soap-suds, which puts a finishing hand to their execution."

The following extract from a report by a Committee of the *Essex Agricultural Society*, will show that this insect, though injurious is not always fatal to this valuable tree:

"An objection to the cultivation of the locust tree is often brought from the fact that they are sometimes destroyed by worms. This is true—but the ravages of this insect are found to be greatest where the trees are few and scattered.—In the grove on this farm, [that of Dr. Nichols of Danvers] which extends over a number of acres, and in the other groves in this vicinity, but very few of the trees are at all injured by worms. This objection is by no means sufficient to authorize the neglect of their cultivation." See N. E. Farmer, vol. iii. page 147.

"*Economy in Money Matters.*—The subscribers to the New England Farmer, who would willingly oblige us by prompt payment, and save fifty cents into the bargain, are respectfully reminded that by paying in advance, they will obtain the current volume of the New England Farmer at \$2.50, instead of \$3.00; which, according to the terms of the paper, will be otherwise the invariable price. The advance payments are now due.—A word to the wise, is worth a whole vocabulary to the otherwise."

[We wish the friends to this journal to bear in mind that by obtaining five subscribers, and forwarding the payment for the same, they will have a copy sent to them, gratis, as long as the payment is annually forwarded. They may thus secure to themselves a copy of the work, and materially forward the interests of the publication.—New subscribers can be supplied with the preceding numbers of the current volume.]

AGRICULTURAL SEMINARY.

An individual has offered to appropriate *ten thousand dollars* to the establishment of a *practical Seminary* for the cultivation of the various branches of agricultural and mechanical science: to be located in the central part of Massachusetts, and placed under the supervision of the American Lyceum. It is expected that this institution, which is to embrace extensive workshops, gardens, &c. on the most approved models, will go into operation early in the ensuing spring. — *Bulletin*.

PREVENTIVE AGAINST CANKER-WORMS.

Some notices of an *invention* for preserving fruit trees from *canker worms* were meant for this week's N. E. Farmer; but, in consequence of the mislaying of papers, they are unavoidably deferred. We hope to publish something on the subject in our next.—An answer to the query of our "Westminster subscriber," as soon as possible, probably next week.

TO PURIFY RANCID BUTTER.

Melt it with a slow fire, in a well glazed earthen vessel, to which put soft water, working them well together, and when it is cold, take away the curd and the whey at the bottom; do it a second and a third time in rose water, always working them well together. The butter thus clarified will be of the sweetest delicious taste.

The following recipe (taken, we believe, originally from an English paper,) is of some consequence if correct. Try and let us know how it succeeds.

Old Dr Hunt used to say when he could not discover the cause of a man's sickness: We'll try this—and we'll try that. We'll shoot into the tree, and if any thing falls, well and good." Aye, replied a wag I fear that is too commonly the case, and in your shooting into the tree, the first thing that generally falls is the patient."

London-porter.—The scale on which brewing is conducted in England, may be conceived from the annual statement of the porter, ale, &c. given in London. The highest on the list is Barclay, Perkins & Co. whose returns of porter for the year ending the 5th July, amounted to 305,937 barrels, or about a 1000 barrels a day, exclusive of holidays. Last year their report was 311,330. The total amount of 10 houses was 1,341,660 barrels, somewhat less than the preceding year.

Moschetoes.—If money has been scarce the present season, moschetoes have been plenty. We speak *feelingly* on this subject, having been kept awake, in torture most acute, by these musical intruders on nocturnal repose. They are terribly annoying, particularly to those not fond of music. A night or two since, we woke up in agony, writhing under the sting of these horrible musicians, that make such "concordant discord," and imagined a full band of musicians in our room, chanting some infernal dirge. If they would sting and be off, we would willingly spare a few of them a drop or two of blood, but then their melody, we had rather hear "a brazen candlestick squeak," or hold sweet "converse with the wheel of a knife grinder." But we have found a remedy.—the moschetto net, commonly called a pavilion, effectually protects against the sting of these tormentors.—*Manuf. and Farmers' Journal*.

WORCESTER CATTLE SHOW.

We have every reason to expect a more magnificent display at the approaching Cattle Show, than has graced the former festivals of our county. Strangers will be doubtless attracted, as well to witness the Exhibition of Agricultural riches, as from curiosity, to be spectators of the commencement of internal navigation. Our County is so filled with beautiful animals, the fields are so profusely spread with the wealth of cultivation, the looms of its manufacturers are so busy in the production of cunning works, that we confidently anticipate an exhibition of the tenants of the stall, the products of the earth, the fabrics of industry, and the combinations of ingenuity, which may sustain the character so justly acquired by the County of Worcester, for the fertility of its soil, and the public spirit of its inhabitants. — *Worcester Egis*.

BLACKSTONE CANAL.

We learn that the Canal is now rendered navigable to Uxbridge in this County, and that it is expected, unless delayed by unfavorable weather, that the whole work will be so far completed by the first week of October next, that boats may pass.

Arrangements have been made to raise the supplies of money necessary for its completion beyond the amount of original subscriptions, by loans obtained on the joint credit of the corporation and some of its most responsible Stockholders, so that no pecuniary delay will impede the completion of the work.

A passage boat is to be constructed in this town, which, with those already navigating the waters of Rhode Island, will probably furnish ample accommodation for the journey of those strangers who may visit us at the approaching Cattle Show. — *Worcester Egis*.

New mode of making Jelly.—Press the juice from the fruit; add the proper portion of sugar, and stir the juice and sugar until the sugar is completely melted; and in twenty-four hours it will become of a proper consistence. By this means the trouble of boiling is avoided, and the jelly retains more completely the flavor of the fruit. Care should be taken to stir the mixture until the sugar is completely melted, and fine sugar should be used.

Treasure trove.—A solid mass of gold was lately found in Anson county, (South Carolina) which weighed about thirteen pounds, Troy weight. It was sold for \$2,500.

Tulips.

Just received at the New England Farmer Seed Store, No. 52 North Market Street
A fine collection of Dutch Tulips of bright red, yellow, white, and splendid variegated colors;—12 1-2 cts. each, \$1.00 per dozen, assorted.

Hemp Seed.

Just received at the New England Farmer Seed Store, No. 52 North Market Street
A consignment from Troy, N.Y. of 50 bushels of Hemp Seed, growth of 1827; by the tierce or bushel.

17 Subscribers to the New England Farmer can have their volumes neatly half bound and lettered at 75 cents, by sending them to this office.

Seeds for Fall Sowing.

For sale at the New England Farmer Seed Store, a fresh supply of various Grass Seeds—also a great variety of vegetable seeds for fall sowing, viz. White Portugal Onion, Strasburg do. Silver skin do. Prickly Spinach and Dutch Cole for early greens—various kinds of lettuce, carrot, cucumber, cabbages, &c.—black Spanish or winter radish, &c. all warranted fresh

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now lies, in full cultivation thirty five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordeaux, Clerac, and Burzet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1828.

Mr A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 100; and 18 cents for less than 50 roots.—Payment to be made on delivery of the roots.—Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 55 Wall street—Boston, E. Copeland, Jr.—Albany, R. M. Michael—Philadelphia, Van Amringe—Baltimore, Willard Rhoads—Washington City, Wm. Pairo.—Richmond, Davenport, Allen & Co.—Savannah, Hall, Shapter & Tupper—New Orleans, Foster & Hutton—Charleston, (S. C.) J. & J. Street & Co. Mr A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal booksellers of the United States; and his agents will furnish them gratis to subscribers.

MISCELLANIES.

(From Bailey's *Lays of a Minstrel*.)

THE BRIDEMAID.

The bridal is over, the guests are all gone,
The bride's only sister sits weeping alone;
The wreath of white roses is torn from her brow
And the heart of the bridemaid is desolate now.

With smiles and caresses she deck'd the fair bride,
And then led her forth with affectionate pride;
She knew that together no more they should dwell,
Yet she smiled when she kissed her and whisper'd farewell.

She would not embitter a festival day,
Nor send her sweet sister in sadness away;
She hears the bells ringing, she sees her depart,
She cannot veil longer the grief of her heart.

She thinks of each pleasure, each pain that endears
The gentle companion of happier years;
The wreath of white roses is torn from her brow,
And the heart of the bridemaid is desolate now.

Sentiments of the famous Mr. Penn with regard to Marriage.—Never marry but for love, but see that thou lovest what is lovely. If love be not thy chiefest motive, thou wilt soon grow weary of a married state, and stray from thy promise, to search out thy pleasures in forbidden places.

Let not enjoyment lessen, but augment affection; it being the basest of passions to like, when we have not, what we slight when we possess.

It is the difference betwixt love and lust, that this is fixed, that volatile; love grows, lust wastes by enjoyment. And the reason is, that one springs from an union of souls, and the other from an union of sense.

They have divers originals, and so have different families; *that* inward and deep, *this* superficial; *that* transient, *this* permanent.

They that marry for money cannot have the true satisfaction of marriage, the requisite means being wanting.

Men are generally more careful of the breed of their horses and their dogs, than of their children.

Those must be of the best sort, for shape, strength, courage, and good conditions; but as for *these*, their own posterity, money shall answer all thy purpose. With such, it makes the crooked strait, sets squaring, gives a cure cures madness, covers folly, cures all conditions, mends the skin, gives a sword, repairs honors, makes young, works wonders.

O how solid is true gravity! Man, the noblest creature of the world. As a God on earth, and the image of Him that made us; thus to mistake earth for heaven, and worship gold for God.

Montgomery has beautifully described Columbus, while meditating on his great expedition, as gazing with eager anticipation, towards the new world which he hoped to discover—

"Lights of Heaven! be quick,
Lead on! I go to win a glorious shield;
By nature nursed beyond the jealous sea,
Doomed to ages, but betrothed to me."

This bride our pilgrim fathers found on these quiverted shores. On her stately bowers no rude spoiler had intruded. None of the corruptions of the old world had found their way into her bosom. She was worthy to be the bride of our forefathers, and to become the mother of a race of freemen.—*Knickerbocker's History.*

GRAVE CORRESPONDENCE.

Dr. Schmidt, of the cathedral of Berlin, wrote to Frederick H. in the following terms:

"Sire—I acquaint your Majesty, first, that there are wanting books of Psalms for the Royal Family. I acquaint your Majesty, second, that there wants wood to warm the Royal seats. I acquaint your Majesty, third, that the balustrade, next the river, behind the church, is become ruinous. Schmidt, *Sacrist of the Cathedral.*"

The King, much amused with the epistle, sent the following answer:

"I acquaint you, Mr. Sacrist Schmidt, first, that those who want to sing may buy books. Second, I acquaint Mr. Sacrist Schmidt, that those who want to be warm, may buy wood. Third, I acquaint Mr. Sacrist Schmidt, that I shall no longer trust to the balustrade next the river. And I acquaint Mr. Sacrist Schmidt, fourth, that I will not have any more correspondence with him.

FREDERICK."

Anecdote.—A venerable Friend and a dashing buck, driving their respective vehicles, met in a narrow road, where neither could pass without the consent of the other. After some dispute, as to which should first turn out, the buck drew a newspaper from his pocket, and set about perusing it very diligently: upon which the Friend, with characteristic composure, asked, "Friend, has thee another paper in thy pocket?" "No!"—"Then when thee has done reading the one in thy hand, I would thank thee to loan it me!"

Empiricism reproved.—When the revolutionary government of France, at the suggestion of the National Institute, attempted to introduce a new meteorology, by dividing the quadrant of the meridian into one hundred, instead of ninety degrees, a French navigator, finding himself much perplexed in the practical application of this new theory, sarcastically recommended to the Assembly a decree that the earth should perform four hundred revolutions in a year!—*Adams' Report on Heights and Measures.*

EPIGRAM.

"On Tuesday next," says Tom to Ned,
"I'll dine with thee, and take a bed."
"You may believe him," William cries
"For where he dines he always lies."

Gov. S. P. Mantland is about to prohibit the distillation of grain into ardent spirits, on account of the scarcity of bread-stuffs in Lower Canada, after the short harvest of the present season. We cannot but hope that this measure may lead to something of importance to the interests of temperance in that country and our own.—*N. Y. D. Advertiser.*

Cure for the Dysentery.—As this is the season most common for the prevalence of this distressing complaint, an experienced man, though not a physician, highly recommends the use of the high Malloes. Take of the upper leaves and seed together, and boil them in milk. Let the suffering patient take of it, for victuals and drink. It is said to give relief invariably, and safely to stop the progress of the disorder. Probably the tow has the same healing virtue.—*Keene's Atlantic.*

The Gardner Lyceum has offered a premium of fifty dollars to encourage the cultivation of hemp in Maine.

Sumach has become an article of traffic in Virginia, where it grows spontaneously. It is gathered in large quantities, and sold from one to two dollars the hundred weight, to be used in drying morocco leather. Thousands of dollars have been paid for it the past summer.—*Microcosm.*

The Agricultural Society of South Carolina recommend a public mart for the disposal of beef, cattle, live stock, &c. to prevent impositions at home and abroad.

Best preparation of black lead for cleaning stoves.—Mix powder of black lead with a little common gin or the dregs of red Port wine, and lay it on the stove with a piece of linen rag; then with a clean, dry and close, but not hard brush, dipped in dried black lead powder, rub it to a beautiful brightness. This will be found to produce a much finer and richer black varnish on the cast iron than either boiling the black lead with small beer and soap, or mixing it with white of egg, &c. which are the methods commonly practised.

Domestic Encyclopedia.

Remedy for Burns and Scalds.—Linseed oil and lime water, of each equal parts. The bottle should be shaken previous to the application, as the ingredients will separate. Apply lint or a piece of linen to the burn, and keep it constantly wet with the above preparation.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturists in the vicinity of Boston and New York, is just published by J. B. WESSLEY, Proprietor of the New England Farmer. The articles are arranged alphabetically, and comprise the most useful VEGETABLES and FRUITS which can be conveniently and economically cultivated in the climate of New England and the Middle States; as well as a Treatise on FLOWERS, and on LANSCAPE or PICTURESCQUE GARDENS, on the general management of the SILK WORM, and the manufacture of SILK, and a Treatise on the culture of GRAPE VINES and the STRAWBERRY. The article on Fruit Trees contains an enumeration and description of all the Apples, Pears, Peaches, Cherries, Plums, Nectarines, Apricots, &c. &c. that can be raised to the most advantage, and their relative forwardness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written.

A list of the contents of the work will be found in the New England Farmer for August 1.

Price \$1.25—Six copies for \$6.00.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D." Boston, through the post-office. 6t Aug. 1

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$1 to \$5 per box. Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Onions for Sale.

Six hundred bushels of prime Onions, (White Portugal, and Straw Coloured) raised by a gentleman in this vicinity, are offered for sale, to traders and others, by the bushel or barrel, on very advantageous terms. Enquire at the New England Farmer Seed Store. Aug. 29

Bleaching Salts.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, a further supply of Bleaching Salts, or chloride of Lime, an account of which may be seen by referring to page 101 of the sixth vol. of the New England Farmer.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of publishing, will receive a deduction of fifty cents.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

FRUIT TREES.

MR FESSENDEN—It is possible that the following crude hints may be useful to some of my less experienced brother-farmers.

Within a few years I have transplanted on my farm several hundred apple trees, some of which have been set in Spring, and some in Autumn.—But not remembering to have lost a single tree, I am unable to say which time is the best.

The method I have generally pursued is this: wherever the soil is thinner, or the land dryer than I could wish, I direct the holes to be dug about 4 feet in diameter, and from 20 to 24 inches deep. And the earth taken from below what is useful as soil, we cart into the road, or wherever it may be wanted, and return to the holes an equal quantity of those small stones which are usually considered a nuisance; with these we intermix any kind of compost, or good soil from the road. In regard to trees in general, I have ever found advantage from intermixing from the earth, while setting, a bushel of rotten manure to each tree.

In digging up the trees we are careful to rob them as little as possible of their roots; and aim to diminish the lateral branches by pruning about as much as the roots have lost in taking up. We set the trees about as deep as they stood in the nursery; treading the ground as hard as we can around them; setting out, and keeping them erect; and let them stand without stakes; or being visited by any horned cattle.

It is surprising to see how rapidly these trees have grown. There are several now in fair view, which were set out in the beginning of May last, on which may be seen a full grown handsome apple. The conclusion will undoubtedly be drawn that these trees must have been thrifty, and of handsome size when removed. They were; and thousands equally good are now for sale, by, Sir,

Yours respectfully,

Newton, Sept. 23, 1828. J. KENRICK.

ABRIDGED COMMUNICATIONS.

(From London's Magazine.)

1. *Cape Broccoli*.—This is grown in great perfection in the following manner: In an open, warm situation, during the first week in June, mark out holes in rows 3 feet apart, and nearly 2 feet over; dig out the holes to the depth of 1 ft. fill half up with rotten dung, and cover this with 2 inches of the mould, which will leave a cavity of four or five inches below the surface; on this sow seeds thinly, rake in, and dust the surface with soot; when the plants have risen three or four inches, select three of the strongest to stand for use, earthing up as they advance, and watering if the season be dry.—*William Boyer, Kings-cote Gardens, Sept. 1, 1827.*

2. *Red Mats*.—These are not used in gardens so much as they deserve to be. Many beds of useful and ornamental plants require temporary covering, either from the winter's frost or summer's sun. Flower beds, as those of tulips, &c., may be protected by the simple contrivance of leaning two mats against each other, like the roof

of a house, and fixing them to a frame of stakes and poles, on which they may be rolled up or let down at pleasure; or if each mat were stretched and fastened to thin ledges of wood and painted, they would be more durable, and withal so portable, that they might be used for any purpose, and at any time.—*S. April 10, 1828.*

3. *To keep the common Blue Plum*.—Glass vessels, or small wooden casks made air and water tight, are used for this purpose. When ripe, the fruit is gathered with great care (the hands being covered with soft gloves, and only the stalks touched, in order to preserve the bloom), and laid one by one in the vessel till it is full. The vessels are then closely covered by wet bladders so as to completely exclude the air, and buried in the ground, or suspended in cisterns, wells, or cellars, out of the reach of frost. In February or March they may be used, and, if the above precautions have been taken, will be found excellent. The vessels should be small-sized; as the fruit remains good but a very short time after being opened.—*T. A. Meyer. Clifton Nursery, Jan. 3.*

4. *To keep Pears*.—In the north of Germany they keep winter pears packed in wooden boxes or casks, interlayered with clean sweet straw, closely shut down, and placed in a room out of the reach of frost. The fruit require examination every month, that those beginning to speck may be used or taken out.—*Id.*

5. *Management of the Fig*.—In the autumn, before the leaves drop from the tree, pull off all the green fruit, because few of them will survive the winter. This, however, should be done before the leaves fall, otherwise the wounds do not heal. It is attended with this advantage, that where one fruit is pulled off, two generally burst from the place in the following spring. If the trees (in pots) are placed in an airy, yet sheltered situation, and carefully defended from frost during winter, they, under ordinary management, yield plentiful crops the ensuing summer.—*Id.*

6. *Protecting Vines from Spring Frost*.—In the west of Germany, where the vine is extensively cultivated, especially near the Rhine and Moselle, the young shoots of the vine are often killed by night-frost, which at once destroys the crop of the present year, and injures the trees for several years to come. To avoid this misfortune, the husbandmen, on evenings when they expect a frost, light a fire on the west side of the vineyard, and keep it up all night. For this purpose, they collect green boughs of trees, wet straw, rubbish, hay, weeds, or any other litter which will burn slowly, and emit much smoke. This remedy is effectual, and, if neglected, the vineyard suffers; the early check prevents the ripening of the wood, and, without this takes place, no great crop can be expected in the following year.—*Id.*

SOWING FRUIT WITH THE SEEDS, &c.

Darwin says when the fruit which surrounds any kind of seeds can be sowed along with them, it may answer some useful purpose. Thus the fruits of crabs, quinces, and some hard pears, will be all the winter injured covered only with their autumnal leaves, and will contribute much to nourish their germinating seeds in the spring.

It has been recommended to sow the seeds of cherries, peaches, and some other fruits which are of perishable nature as soon after the fruit is ripe as possible. If the seeds are kept till the next spring they become dried through, and the vegetative principle is destroyed. It is a good plan to keep small and rare seeds in their pods till the season for sowing them.

FOR THE NEW ENGLAND FARMER.

MR FESSENDEN—In your paper of the 15th inst. you mention as an important circumstance, that the *Bread-fruit Tree* is about to be introduced into the gardens of the London Horticultural Society at Chiswick. To show that our American establishments are not behind those of Europe, I have to state that *three species* of the Bread-fruit have been cultivated at Mr. Prince's Linnaean Botanic Garden at New-York for a number of years, viz. the *Artocarpus incisa*, or Otahite bread-fruit, *Artocarpus sinensis*, or Chinese, and *Artocarpus nuciifera*, or Nut-bearing, of each of which species he has from six to twelve plants in a most flourishing state. The price of the first named species at London in the spring of 1827, was seven to ten guineas each plant; in Mr. Prince's catalogue they are priced at \$10 each.

DOUBLE CARTS.

MR FESSENDEN—In London's Encyclopedia of Agriculture, page 402, is a description of a wagon, which is so contrived that it may be changed into two carts by separating the forward from the hind wheels, without any other alteration. I wish to inquire of you, or through the medium of your useful paper, whether there are any such wagons used in or near Boston? If so, do they answer a good purpose? What are the best dimensions for one? And what would probably be the cost of one? By communicating any information relative to the subject, you will render a favor on

A SUBSCRIBER.

Westminster, Vt. Sept. 18, 1828.

Remarks by the Editor.—The wagon alluded to by our correspondent, is thus described by Mr London:

"Rood's Patent Wagon is a contrivance whereby the same carriage may, in a few minutes, be changed into two complete tip-carts of the common dimensions, and applicable to all the uses of carts in general, or into one wagon, so complete, that a narrow inspection is necessary to distinguish it from a common wagon. The carts have a contrivance to render them more safe and easy to the horse in going down a hill, and have movable side ladders, which will be found of great use in carrying corn, bark, &c. It may be constructed with perfect facility by the wheel-wrights of any county; its shape and particular dimensions can be suited to the wishes of the owner, or to the particular fashion of his neighborhood."

The result of considerable experience and enquiries enables its inventor to state, that it may in any county, be completed for about five pounds, (\$22.20) more than the cost of two common carts. It must, however, be admitted to be some

more clumsy than a common wagon."

The cut which in Mr London's work, accompanies this verbal description, renders it little if any more intelligible; as the mode of connecting the two carts into one wagon is not shown precisely, though the shafts of the hind cart appear to be conducted under the body of that which precedes it, where they are doubtless fastened with pins, or some other means. The "contrivance" to render them more safe and easy to the horse in going down a hill," appears to be a mode of giving play to the shafts up and down, while the bodies of each cart retain their horizontal position and do not bear on the horse attached to the shaft. The side ladders resemble those commonly attached, in this country, to hay carts.

Any wheel-wright of tolerable ingenuity could make one of these wagons, from the above description, which if not precisely like that above alluded to, would answer all its purposes. We have, however, never seen nor heard of any thing of the kind in this country; and from the circumstance of its being "more clumsy than a common wagon," as well as more expensive, we do not believe any thing of the sort will soon be adopted in the United States.

From the North Carolina Register.

ICE HOUSES.

We are indebted to an intelligent friend for the following remarks on the best method of collecting and preserving ice:

The great difficulty in obtaining a full supply of this article in the climate of North Carolina, arises from the short continuance of the ice in its mild and changeable winters.

It often happens that ice does not form thick enough to be worth collecting more than once during the season, and remains only two or three days before a change in the weather carries it suddenly off; within this short period, it is scarcely possible to obtain a full supply, especially where it is to be hauled a mile or two to the house in which it is to be preserved.

To remove this difficulty, it has been proposed to build a temporary ice-house near the pond from which the ice is to be taken, into which the ice may be thrown, to be carted afterwards to the ice house as may be convenient.

The following plan was tried the last winter by a gentleman in a neighboring state, and attended with complete success:

A pen of logs, about 18 feet square, was put up on the margin of a pond, and this was raised about 5 feet high. It was then covered with planks, so as entirely to exclude the rain and sunshine. Into this pen the ice was thrown without further preparation, except that a small ditch was dug around the pen, to prevent the water from rain running under the ice. The ice was afterwards carted to the ice-house in all the month of January, selecting for that purpose clear, dry weather, without regard to sunshine. Ten hands filled this pen in less than two days, and this quantity afforded an ample supply for a large family during the succeeding summer.

An ice house is incomplete, if it be without a drain to carry off the dissolved ice. Where this cannot be conveniently obtained, a well six or eight feet deep may be dug on one side of the pit to receive the water which drains from the ice; but the first plan is much to be preferred. And

as moisture is very unfriendly to the preservation of ice, an ice house should be constructed with a window at each end, which should be opened in dry, but closed in damp weather.

A large shelter or covering of rough plank or boards, raised about two feet above the top of the ice house, is the next and the greatest improvement in the construction of ice houses, which modern enterprise has been able to effect.

By attending to the above suggestions, a supply of this agreeable article in domestic economy may be obtained with a greater certainty of success than by any method now practised.

[A correspondent wishes to know how ice houses may be constructed above ground, in low, damp situations, where water lies too near the surface to admit of making them below it, in the usual way. To this we can only say, what appears obvious, that a pen of logs must be raised above ground, surrounded by some means, no matter what, with earth, in such manner as to exclude the effect of the heat of the sun. Suppose a double house, with the intervening space so wide as to be filled in with earth or tan-bark to exclude the heat? This would, perhaps, be easier than to build up a mound of earth from a considerable distance from the base of the house to the top it. Both would be expensive; but no doubt the thing may be done, and the object is worthy of much labor to accomplish it.]

From the American Farmer.

CURE FOR THE GRUBS, OR BOTTS, IN HORSES.

In answer to "Inquiries about Diseases of Horses."

MR. SKINNER.—An inquirer in your paper of August 15th, No. 22, is desirous to find out a remedy for the grubs in horses. He shall have the result of my experience, with great pleasure, regarding that truly dreadful disease of the noble and useful animal, the horse. I consider the free use of salt as a sovereign remedy for the grubs. I learned this from that industrious and useful class of citizens, the Dutch, or Germans. I had long known that they were in the habit of freely salting their horses, and the result was, that they never lost a horse with grubs; the use of salt not only kept them free from disease, but essentially contributed to keep them in fine condition, sleek and fat, as is well known to all who have observed the valuable work horses used by that class of our citizens.

I have for many years been constantly in the habit of salting my blood stock of horses with my own hands, three and four times a week, and frequently every day. To effect this the more conveniently, I always keep a small bag of salt convenient to them; and whenever I see them, which is rarely less than once a day, I throw a handful of salt to each head. The result of this attention, in the free use of salt, has been very gratifying; for my stock of blood horses, mares, and colts, has always been remarkably healthy, disposed to thrive kindly, and I have never lost one by disease of any kind.

But the valuable use of salt does not stop in the prevention of the grubs. When a horse is

really attacked with the grubs, I know no remedy so efficacious or sovereign in the cure as *fish brine*, which consists of the strongest kind of alum salt. I have frequently tried it, and never knew it to fail. I would therefore say to all who have horses, preserve your *fish brine*. It is prepared by beating fine the salt in the fish brine; take a double handful, put it in a quart of warm water to dissolve it quick, and drench the horse from a quart bottle.

If relief is not obtained in a half hour or three quarters, drench again with the same quantity.—If fish brine is not at hand, fresh alum salt prepared in the same way, but using more, will answer the same good effects. The brine is supposed to act upon the pores of the body of the grub, and to strike into them, by which they are made to contract or draw up their bodies, and thereby let go their hold upon the coats of the stomach, or maw of the horse. Your "Inquirer" is referred to the first numbers of a series of essays written by me, and published in the Farmer, for the best mode of rearing colts, and treating of mares; also to Mr. Brodnax's remarks, prefaced by me, and published in the Farmer a few months ago. AUTHOR OF "ANNALS OF THE TURF."

EDWARDS' PATENT ROTARY MACHINE.

Mr. Fox's merchant flour mill, situated on a high bank, east end of Fifth-street, Cincinnati, is three stories high, large, strong, and handsomely built, and the machinery in complete operation for merchant work. It has an overshot water wheel thirty feet in diameter, and two run of burrs four feet in diameter. The water that propels the water wheel is produced by two rotary pumps or suction machines, on a new principle, invented by John Edwards, of this city, who has a patent for the same. The water is raised by a small steam engine, which throws a sufficiency to run the two run of burrs, with all the gearing and machinery of the mill. It is allowed by good judges, that this mill makes as good flour as is made in the western country. It is considered a great acquisition to this city, and this new patent bids fair to be of great utility to the United States, as it will answer for all sorts of machinery, as well as for a mill. The water, after acting on the water wheel, returns continually, without any loss except the evaporation, which is but small, and can be kept up by a small spring or well. This mill has been principally supported by the rain from the spouts round the mill, which is conducted to the forebay or cisterns. It is allowed by judges, that the engine now in use throws water enough, besides the two pair of burrs now in use, to run another pair; and that there is power sufficient still left to run another pump of the same size. As many pumps as she can run will be so many pair of burrs. It is now open to view, and the community can visit the mill and judge for themselves.—*Cincinnati Republican*.

A baked soup.—Put a pound of any kind of meat, cut in slices—two onions, two carrots, each cut in slices—two ounces of rice, a pint of split peas, or whole ones previously soaked—pepper, and salt, into an earthen jug or pan, and pour one gallon of water. Cover it very close, and bake it with the bread.

Two medicine pedlars went to Nantucket with a lot of boluses. They could sell nothing—the people were so healthy.

THE FLOOD.

Since the waters receded from the meadows, some of the farmers have been engaged in stripping down the husks of the Indian corn, leaving the ears to dry and ripen on the stalks; others in gathering their corn and husking it. Some of it is but little injured, and some is materially damaged. The potatoes are completely ruined, and most of them will be left in the ground. We believe that a great portion of the potatoes in the low meadows in Hadley, Hatfield and Deerfield, have shared the same fate with those in Northampton.

Considerable loss has been sustained in nearly all the towns in this county. The roads are much injured, many bridges gone, and much damage done to other property. Josiah Mills, Esq. of Worthington, lost fifty merino sheep. We are informed that one fourth of an acre of land in Amherst was carried away to the depth of twenty feet, and deposited on a lower field. In Northampton a blacksmith's shop, and some other property belonging to Mr. Salmon Ensign, were swept away.

Errors corrected.—The bridge on Fort river in Hadley is not gone. The water cut a broad channel round the bridge, but did not carry it off. We were misinformed in regard to the destruction of salt at South Hadley Canal.

In the vicinity of Hartford the low lands were covered with water, and the crops destroyed or much injured. In the city some families were driven from their houses in the streets near the river. The damage at Enfield Falls is estimated at from 5000 to 10,000 dollars; the Hartford Mirror says the loss will not exceed 5000 dollars.

At Farmington the embankment of the canal adjoining the river gave way for a number of rods, and the earth was removed ten or twelve feet below the original bottom of the canal. The great culvert was seriously undermined and damaged, and the mouth of the Farmington feeder greatly injured.

The papers from the north and south are filled with accounts of the disasters occasioned by the late rains.—*Hampshire Gazette.*

INSTINCT OF A SHEEP.

A gentleman of Inverness, on a recent journey in the Highlands, while passing through a lonely and unfrequented district, observed a sheep hurrying towards the road before him, as if to intercept his progress, and at the same time bleating most piteously. On approaching nearer, the animal redoubled its cries, and looking significantly in the face of the traveller, seemed to implore some favor or assistance at his hands. Touched with a sight so unusual, the gentleman alighted, and leaving his gig, followed the sheep, to a field in a direction whence it came. There, in a solitary cairn, at a considerable distance from the road, the sheep halted, and our traveller found a lamb completely wedged in between two large stones of the cairn, and struggling feebly with its legs uppermost. The gentleman instantly extricated the little sufferer, and placed it safely on the neighboring greensward, while its overjoyed mother poured forth her thanks in a long continued and grateful, if not a musical strain.—*Inverness Courier.*

Johnny, or bu-cake.—Scald one quart of milk, and put it to three pints of Indian meal, and add a pint of fine flour—salt and sweeten it and bake it before the fire.

Method of dissipating Storms.—It is not uncommon at sea, when danger is threatened from a water spout, to fire a broadside at the mass. In the Macomais, in France, they sometimes make use of a similar expedient to dissipate destructive storms of hail or rain, by explosions of gunpowder. This experiment was first tried at Varenard, by the Marquis de Chevières, a retired naval officer, who had got the hint at sea by observing the effect which discharges of ordnance produced upon the atmosphere. It was found so beneficial, that for several years an annual appropriation of 1600 lbs. of gunpowder was made for the purpose.

A farmer who lives in the immediate neighborhood of Bedford, and regularly attends the market there was returning home in the evening very recently on horseback, rather groggy, and not being able very well to maintain his equilibrium, he rolled off, *volens volens* into the middle of the road. His horse stood still; but after remaining patiently for some time, and not observing any disposition in its rider to get up or proceed further, he took him by the collar and shook him.—This had little or no effect, for the farmer only gave a grumble of dissatisfaction at having his repose disturbed. The horse was not to be put off with any such evasion, and so applied his mouth to one of his coat laps, and after several attempts in this way to raise him upon his feet, the coat lap gave way. Three individuals, who witnessed this extraordinary proceeding, then came up, and assisted him in mounting his charger, putting the one coat tail into the pocket of the other, and so he safely reached his home. This horse is deservedly a favorite of his master, and has, we understand, occasionally been engaged in gambols with him like a dog.—*Time Mercur.*

JOURNAL OF NATURAL HISTORY.

Mr LONDON, the indefatigable compiler of the well known Encyclopedias of Agriculture and Gardening, and the Editor of the Gardener's Magazine, a periodical work in London, conducted with distinguished ability, has lately undertaken another journal, called The Magazine of Natural History, and Journal of Zoology, Botany, Mineralogy, Geology and Meteorology. In 8vo. (to be continued every two months, alternately with the Gardener's Magazine) price 3s. 6d. The different departments edited by gentlemen eminent in each. The drawings of Botany and Conchology, by Sewerby;—of Animals, by Harvey;—of Trees, by Strutt;—and the Engravings on Wood by Branston.

The objects of this work are—To record every new fact belonging to the subject; to render every part of the subject interesting to the amateur and general reader; to lead on the reader by degrees from the more elementary details to higher views and discussions; and to translate the technical terms, and Latin or Greek words used in Natural History, as they occur, and to give the derivation and accentuation of all systematic names. The arrangement will be as follows:—

I. *Zoology*.—1. Original Communications. 2. Reviews. 3. Collectanea, i.e. short Notices collected from various sources; Abstracts or Abridgments of the most interesting papers in Foreign Journals, &c.

II. *Botany*. The same.

III. *Mineralogy*. The same.

IV. *Geology*. The same.

V. *Meteorology*. The same.

VI. *The General Subject*. 1. Original papers of a Miscellaneous Description, or embracing two or more Departments, or a topic common to the whole of Natural History. 2. Analytical Reviews of Books on Natural History in general; such as Elementary Works, Systems, Transactions of Societies, Travels, &c. 3. Miscellaneous Domestic Intelligence relative to the general subject, including Meetings of Natural History Societies, Notices respecting Museums, Sales of objects of Natural History, Names of Dealers, List of Prices, Visits to Collections, &c. 4. Miscellaneous Colonial and Foreign Intelligence. 5. A Comparative Calendar of Nature for different parts of the World, and particularly for different and distinctly situated parts of Britain. 6. Indicatorial Calendar, pointing out the Objects to which the Student ought to attend during the ensuing month. 7. Desiderata, i.e. topics or particular points of Natural History, foreign or domestic, which require to be investigated. 8. Queries, and Answers to Queries. 9. Retrospective Criticism.—10. Obituary and Biography. 11. Catalogue of Books in the different Departments of Natural History. 12. Notices of Works in the Press, or in preparation.

The first number, among other subjects, contains articles on the Birds of America; on the Natural History of Plants; on the Principal Forest Trees of Europe, considered as Elements of Landscape; the state of Natural History in North America, &c.

We have made arrangements for receiving these works from London, and shall enrich the columns of the New England Farmer with extracts from such articles as will interest American readers.

AGRICULTURAL WORKS.

Among other agricultural works recently published in London, we notice the following:—A Treatise on the Cultivation of Mangel Wurzel, with Observations on the Utility of Steaming Food for Cattle; by George Bridges; 8vo. 3s. 6d. Transactions of the Botanical and Horticultural Society of the counties of Durham, Northumberland, and Newcastle-upon-Tyne; Vol. I.; Part I. 2s. 6d. An Introduction to Entomology, or Elements of the Natural History of Insects; by William Kirby, and William Spence, Esq. F.L.S. Botanical Arrangement of British Plants; by W. Withering, Esq. LL.D. F.R.S. &c. The English Flora; by Sir James E. Smith, M.D. F.R.S. President of the Linnean Society, &c. &c.; in 4 vols. 8vo. "Sylvia Florifera," the "Shrubbery;" containing an Historical and Botanical Account of the Flowering Shrubs and Trees which now ornament the Shrubbery, the Park, and Rural Scenes in general; by Henry Philips, F.H.S. author of the History of Fruits known in Great Britain, and the History of Cultivated Vegetables. 2 vols. 8vo. Conversations on Botany, with Twenty-one Engravings. Conversations on Mineralogy, with Plates.

Malaria.—The sickness which now prevails on Long Island, and which suddenly attacks whole families, is considered by some to be the malaria, so well known in Europe, and which arises from heat, moisture, and the decay of vegetation. Its effects in some places have been dreadful indeed, and we trust will call forth the investigation of gentlemen of medical talent.—*L. I. Star.*

SILK.

Hatching of the Moths, and their preservation.

Continued from page 62.

Cocoons kept in a temperature of 66° begin to be hatched after fifteen days: those kept in a heat between 71° and 73°, begin to come forth after eleven or twelve days. The room in which the moths are produced should be dark, or at least there should be only sufficient light to distinguish objects. This is an important rule, and must be carefully attended to. The moths do not come forth in great numbers the first or the second day, but are chiefly hatched on the fourth, fifth, sixth and seventh days, according to the degree of heat in which the cocoons have been kept.—The hours when the moths burst the cocoons in the greatest numbers, are the three and four hours after sunrise, if the temperature is from 64° to 66°. The male moths, the very moment they come out, go eagerly in quest of the female; when they are united, they must be placed on frames covered with linen, and made in such a manner as to allow the linen to be changed when soiled. Much care must be taken in raising the united moths: they must be held by the wings in order not to separate them. When one small table is filled with moths in a state of union, they are to be carried into a small room, sufficiently airy and fresh, and which can be made very dark. Having employed the first hours of the day in selecting and carrying the united moths, the males and females which are found separate on the tables, are to be brought into contact, put on frames and carried into the dark room. It is easy to ascertain if there are more females than males. The body of the female is nearly double the size of that of the male; besides, the male which is single, beats about its wings at the least approach of light; the hour must be noted at which the tables containing the united moths are placed in the dark room.

If, after this operation is over, there still remain some moths of each sex, they are to be placed in a small box with a perforated cover, until the moment favorable for their union arrives. From time to time, they must be looked at, to see if they separate, in order that they may be brought anew into contact.

When anything is to be done in the dark chamber, as little light as possible must be admitted; only sufficient to distinguish objects. The more light there is, the more the moths are disturbed and troubled in their operations, as light is too stimulating for them. The boxes are very convenient to keep quiet the males which remain, and thus prevent the fine powder adhering to their wings from flying about, and the destruction of their wings, and consequently their vital power. The cocoons must be removed as fast as they are pierced by the moth, for being moist, they communicate their humidity to those which are still entire. The paper, also, on the trays, when soiled, is to be removed, and fresh supplied.—Constant attention is required during the whole day, as there is a succession in the process of hatching, and union of the moths, which occasionally vary in relative proportion to one another. Instead of a frame, paper may be used for the purpose of receiving the eggs. A few good cocoons will not produce a moth, owing to their hardness, which prevents the moth from making a hole by which to come forth.

If there be an excess of males, they must be

thrown away; if of females, males must be allotted to them, which have already been in a state of union. Great care must be taken, when the couples are separated, not to injure the males. The male ought not to remain united more than six hours; after the lapse of that time, take the moths by the wings and body, and separate them gently. All the males which are no longer in union, must be placed upon a frame; the most vigorous afterwards selected, and united with those females which have not yet had a mate. Other vigorous males must be preserved in a separate box, and kept in darkness. When there is a want of males, let them remain united to the female the first time only five hours, instead of six; the females are not injured by waiting for the male even many hours; the only loss sustained, is that of some eggs, which are not impregnated. Before separating the two sexes, prepare, in a cool, dry, airy chamber, the linen on which the moth is to deposit its eggs.

Six hours, as just said, is the usual time for the moths to remain united, for in that time the eggs of the female will be fully impregnated. It is also the general practice not to use the male for another female; but Mr. Delonchamps* assures us, that in the event of having more female than male moths, the latter may be again used to profit. In the year 1824, he raised many worms from eggs, the produce of a sixth coupling, which were fully equal to those produced from eggs at the first; the union continued never less than from twenty to twenty-four hours; the male after a sixth union appeared as lively and brisk as at first, but he had no more females. The eggs from even a thirteenth union of the same male with different females, had all the characters of those of the best quality. In these cases, the disunion of the pair was, moreover, never spontaneous, but always required to be effected by the hands.

The following is the manner in which the cloth must be arranged:

At the bottom of a tressel or frame, which must be proportioned to the number of moths, place horizontally, on each side of the length, two boards, so arranged that one of their sides may be nailed to the tressel, about five inches and a half high above the ground, and that the other side of the board shall be a little higher, and project outwards. Upon the tressel lay a cloth, so that it may hang equally on each side. The ends of the cloth must cover the boards below: the more perpendicular the lateral parts of the tressel are, the less soiled will be the cloth by the evacuation of the liquid from the moths. The moths which have been united six hours are then to be gently separated, the females placed on the frame, and carried to the tressel and placed on the cloth, one over another, beginning at the top and going downwards. Note the time at which the moths are placed on the cloth, and keep those which are placed afterwards separate, to avoid confusion.—The females that have had a virgin mate must be treated in the same manner as those which have been united with one that had been coupled previously five hours. The females should be left on the cloth 26 or 40 hours, without being touched: at this time, if it be observed that the linen has not been well stocked with eggs, other fe-

males must be placed upon it, in order that the eggs may be equally distributed. When the heat of the room is 77° or 79°, or when at 63° or 65°, the eggs will be yellow, that is, unimpregnated; or of a reddish color, that is, imperfectly impregnated, and will not produce worms: the temperature of the room must therefore be kept between these extremes. Sometimes a female moth will escape from its mate before impregnation, and produce many useless eggs.—*To be continued.*

HEMP.

The following letter to a gentleman in this town, on the subject of harveing hemp for seed or lint, is well entitled to the particular attention of hemp growers in this section, where but little practical knowledge exists as to the culture of this important article. The value of Mr. Hines' remarks will be obvious to every experienced farmer, and when he perceives the ease with which hemp is cultivated, and looks to the extensive home market secured to it by the tariff, he can no longer hesitate as to the policy of turning his attention to the production of an article for which there must always be a high demand.

Burlington, Vt. Free Press.

“There is no invariable rule as to the time of cutting hemp planted for seed, by the general complexion of either the male or female; but particular care must be had to the color of the seed, when the hull that encloses it is taken off.—The seed should be generally changed to a grey or brownish cast. If two thirds of the seed wear that appearance, the sooner you cut the better.—It should be bound in small bundles immediately after cutting, and set up in small stacks—from four to six bundles in a stack—binding in all the branches, by putting three bands round the same near the top of the shocks or stacks. It may stand in this situation until dry enough to thresh, — say from five to ten days, as the weather may be for drying.

“The seed may be threshed in the field on sheets made of strong cloth, or on a floor. Great care should be used in moving the hemp to the place of threshing. If threshed in the field, it should be moved on a cloth attached to two poles, like hay poles, to save the loose seed. If removed to a barn, it should be done on a cart or wagon, with a cloth or tight box.

“We clean with a common fanning mill, taking care to give the proper speed, and to gauge every part to suit the weight of the seed.

“After the seed is cleaned and put into bins or casks, it will be well to shovel it over, to prevent it from heating. I am quite sure that seed kept from heating, and from wet, will be good as long as three years, if kept cool in the summer.

“If your hemp is sown broadcast, and you design to save the seed, cut it when about half the seeds have begun to change their color, and proceed as above directed—only you will thresh in four fair days, without breaking the bundles, and put the hemp under cover to completely cure,—and when thoroughly cured, you may thresh again, breaking the bands as other grain.

“Mr. Lewis Ruffet, of Seaghtoeke, the last year, sowed five bushels of seed on two and a half acres of land. He cut his hemp with a cradle, and practised as here directed. He saved sixty-six bushels of seed, of a good quality; and his share of the hemp sold for seventy-two dollars,

* Essai Sur l'Histoire des Mûriers et des Vers à Soie. p. 62. Paris, 1824.

after paying for the dressing in hemp.—Total value of the lint, one hundred and eight dollars.—Such hemp, when broken in an unrotted state, and subjected to a water process after breaking, and properly cleaned, will equal the best Russian hemp.

"We use the common corn cutter for cutting planted hemp; but use it carefully, so as not to jar off the seed.

"In all cases where you wish to save the lint, you will be careful to put the stem under cover as soon as you can, to prevent it from being stained by the weather.

"N. B.—Use the common flail for threshing.

"I am, in great haste, your obedient servant,

"JOSEPH HINES.

"Stillwater, N. Y. Aug. 21. 1828."

From London's Gardener's Magazine.

On the Holly and the Hazel, as Underwood.

By Mr. JAMES FRAZER.

That holly and hazel, independently of their uses, are the principal constituents in the filling up of sylvan scenery, few, I presume, will deny; some hints, therefore, relative to the treatment of these shrubs, both in an ornamental and useful point of view, may perhaps not be unacceptable to some of your numerous readers.

Although there are many extensive places where the woods, &c. do not come under the gardener's superintendence, yet every gardener ought to be conversant in these matters. I am sorry to say, however, that in the greater part of the plantations I have visited throughout this country (Ireland), these useful and ornamental shrubs, in common with the other trees, are shamefully neglected by all parties concerned in their management.

The holly, as a shrub, is unequalled, whether we consider its stature and mode of growth, or its variety, color, and permanency of foliage. It is found in its natural state in various soils and situations: but it appears to flourish most in a loamy soil, inclining to peat, as may be seen in the vast tracts of natural wood in these countries. The whip-makers, as I have found, give a decided preference, for whip-handles, to the holly grown on upland: not only on account of its being tougher, but, by reason of its slower growth, the branches are more closely set, which saves them considerable trouble in forming artificial knots. The turners adapt the holly grown in various situations to different purposes, according to the density of the timber. The hazel luxuriates most in deep upland; and although it is to be met with in the rocky glen, on the mountain side, and in the bosom of the forest, yet, in a profitable point of view, a strong and dry beam will be found the most advantageous. There are few plants more accommodating, none more simply beautiful; and it is an indispensable appendage in representing the truly picturesque scenery of our country. The coopers also prefer, for hoops, hazels of upland growth, as the whip-makers do the holly for handles, but for different reasons, as quickness of growth and thinness of branches are, with the cooper, principal accommodations.

With regard to the hazel copses in this country, I have met with very few under what I conceive proper management. In many of them prema-

ture and irregular cutting takes place; in others they are suffered to grow till beauty and utility are sacrificed, and the standard trees of the wood much injured. When cut over, every shoot which springs up is suffered to remain on the stools till the next period of cutting, unless, indeed, when near a market town, a few young shoots are cut and sold for basket rods, &c.—When beauty and cover for game form the sole object, with regard both to holly and hazel, the principal matter to attend to is to keep the bushes of a moderate height, and to lop off any straggling branches which have a tendency to produce nakedness at bottom. When profit only is considered, a different course is to be pursued. In young copses, the chief thing is to invigorate the roots, and to suffer no more shoots than are absolutely necessary, to remain in the stools till they have acquired sufficient strength. After cutting over, should the stools push strongly, the superfluous shoots ought to be occasionally displaced, leaving only what the stools can fully support; and those intended to remain for hoops and poles may be much forwarded by rubbing off all unnecessary buds as they appear. This work I have readily performed with children. When profit and ornament are jointly considered, which is uniformly the case in demesnes, &c. the copses in the interior of the wood or plantation, if of any extent, may be treated in the manner suggested for profit, and those along the margins, by the sides of the roads, walks, &c. managed as hinted at for game covers and beauty.

Notice of a Mode of procuring Sticks for training Knight's Marrow Pea.—By SUFFOLCIENSIS.

The difficulty and expense in procuring sticks for Knight's Gigantic or Tall Marrow Pea, have prevented many persons from growing that excellent vegetable. Having this year experienced some trouble in accomplishing this object, I turned my attention to some plan by which the use of long sticks might be superseded, and have just tried one, which appears calculated to answer every purpose. Although it will be attended with some little expense at first, I have no doubt it will eventually prove cheaper to a regular grower than any other.

I have provided an upright stake or standard of oak 3 in. by 1½ in. about 7½ ft. long. Holes are bored through this with a half-inch auger, about 3 inches distant. Having procured some good branching pea-sticks, from 3 feet to 5 feet long, I begin on one side at bottom, and place them in the holes, in such a way as to make them touch and form a complete fan. I then fill the other side in the same manner. My oak standard, when complete, shows sufficient pea-sticks for 8

feet or 9 feet length of row, 6 feet high; as I propose driving it 18 inches into the ground, that it may be so firmly fixed as not to be moved by the wind. If any trouble arises in making the sticks fast in the stake, it is very easily remedied by driving a small wedge in to secure them. The sticks I used are elm, but hazel or any other which is spreading, with small twigs or spray, will do equally well.

I have sent you a sketch of one of these pea sticks, which may perhaps be a better guide to any of your readers who are inclined to try them, than my explanation alone.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 26, 1828.

GARDENER'S WORK FOR SEPTEMBER.

Hoe and thin your growing crops of spinach. Earth up celery as it advances in growth, but be careful to avoid covering the hearts of the plants. This work should be done in a dry day. See that you do not bruise nor injure the stalks; for if they are crushed or wounded they will be subject to rot. Towards the latter end of the month you may transplant all kinds of hardy perennial, aromatic, and medicinal herbs, which will thus become rooted before winter. This work should if possible, be done in moist weather. Pull and preserve your ripe onions, and sow more to stand over winter. Protect grapes and other fruit against wasps. This may be done by hanging up phials of honied or sugared water near the fruit you wish to defend. Thoroughly clean from weeds all the seed beds and nurseries of trees.

HORSES.

Great numbers of horses have died within a few weeks, in the neighboring parts of Long Island, of the disease known by the name of "blind staggers." Opinions of practical farriers so far as we have heard, are various with regard to the cause. Many horses, as we have been informed, which had been sent from stables in the city, for the benefit of the air and pastures, have fallen victims to this disorder.

The Old Colony Memorial, published at Plymouth, Mass. mentions that the same disease is very prevalent in that vicinity, and gives the following remedy, from Hason's Farriery.

Bleed in the neck three times a week. Take an ounce of assafetida, one tea spoonful of salt petre, mix them and give them as a drink three times a week in the morning. Give an injection of meal water, nuchases and hard. Rub him well and exercise him moderately. A mash may be given him of bran, sulphur, salt petre, sassaparilla and assafetida; but give no drink for six hours. If all this answers no purpose after a few days, then take twenty-five grains of calomel, two drachms of opium, one drachm of powdered fenel seed, mixed with some syrup into a ball, and give it in the morning for three or four days.

It is said that the following treatment, after repeated trials has proved effectual.

Take juice of garlic six spoonful, and pour it down the horse's throat by means of a horn or bottle or give it as a drench. If after two or three hours there is no relief then repeat it. The juice of the leek or onion, given in a greater quantity, will produce nearly the same effect.

It is pretty well ascertained that horses continue

* In Ireland, hazel poles, from four to eight years' growth, are in great demand for hoops for butter tubs.

ed in stables, seldom, if ever, have the staggers. Therefore "it would be advisable for every person, whose situation will admit of it, to confine their horses, particularly at night, during the spring and fall months."—*N. E. Daily Advertiser.*

FOR THE NEW ENGLAND FARMER.

ELDER-BERRY SYRUP.

MR. FESSENDEN—I was pleased to see an article in your paper of the 19th inst. calling the attention of your readers to a more frequent use of Elder-berry. It is a little singular that the Syrup of Elder-berry has not been used to a greater extent, when a family can have so valuable, and at the same time so innocent a medicine, always at hand, which might often save the call of a physician. I have been in the habit of making the syrup of elder-berries for the last seven or eight years, and have never found the least difficulty in keeping it. Accompanying this, you have a sample of some made about three years since; which looks as well as when first made.

The following is the recipe for making syrup: Take of the juice of elder-berry one quart; boil to one pint; strain, and add two pounds double refined sugar; again place it over the fire; so soon as it shall have boiled, remove it from the fire; and when cold, bottle it for use, taking care to have it well corked. Should they neglect to put in the above quantity of sugar, there will be danger of its becoming mouldy. As a gentle purgative, this syrup is an excellent medicine, of very pleasant taste; and is particularly serviceable for children who are difficult about taking medicine. The dose for an adult is a wine glass full.

FRUIT LADDER.

A gentleman, who is friendly to the objects of our paper, has been so obliging as to communicate to us, verbally, the following description of a ladder for gathering fruit, pruning trees, &c., which he says is much used in some parts of Maine:

It consists of two upright posts, from 7 to 10 feet long, (more or less, at the option of the constructor,) inclining towards each other, about 4 feet apart at the bottom, and 1 foot at the top. The rounds of the ladder pass through these posts, and are about a foot apart. They are made somewhat larger in the middle than at the places where they are inserted into the posts, to give the greater strength to the machine. A third post is added to these, through which the top round of the ladder passes, permitting the post last mentioned to turn thereon, so that its lower end may be set at a greater or less distance from the other two posts, or rather from a straight line drawn between them. This ladder may be made light and portable, and possesses the advantage of supporting itself without leaning on any other object.

HARVEST IN ENGLAND.

Many English papers are complaining of the weather, the prospects or actual state of the harvest. But the London World, of Aug. 20th says, "all accounts concur in asserting that the corn has suffered, comparatively with the anticipation, very little; and generally, there is an average produce. The great loss has been in the hay; which in many places, especially in low lands, has been either carried off by floods, or rotted by long continued moisture. In Ireland the weather has up-

on the whole, been good; and crops there are reported to be abundant, more especially potatoes. The state of the weather has not of late differed in France from what it has been in this country. Rains have been abundant in almost all its Provinces. Nevertheless, the price of wheat had fallen in some markets, and that of bread underwent a decline in proportion. From all parts of France it is stated that the harvest has not suffered the damage which had been apprehended from the bad weather; the farmers, however, are represented as anxious for a suspension of the rain. Some fears being entertained respecting the harvest in the neighborhood of Paris, the metropolitan Archbishop had ordered that prayers should be offered up in all his parishes for the cessation of the rain."

CATTLE SHOWS AND AGRICULTURAL EXHIBITIONS.

At Worcester on the 8th day of October. Address by Wm. Hastings, Esq. of Mendon.

The old Agricultural Society of Berkshire, will exhibit on the 1st and 2nd days of Oct. Ploughing-match, 1st day. Address 2nd day.

The Essex Agricultural Society, (at Newbury,) yesterday.—We have not been able to obtain an account of their proceedings for this day's paper; but we learn that appearances give promise of a good exhibition.

The Mass Agricultural Society, at Brighton, on the 15th of October.

The Hillsborough Agricultural Society, at Amherst, N. H. yesterday. Address by Rev. WILLIAM BRADFORD.

Middlesex Society of Husbandry and Manufactures, 8th of October. Address by Rev. BERNARD WHITMAN, of Waltham. A list of all the Committees, and the Premiums may be seen at the Farmer office.

WINSHIPS' NURSERY.

We commend to our readers in the country, and to those in town, if they have a patch of earth on which to raise a tree or a shrub, the Nursery of the Messrs. Winships in Brighton, a catalogue of which has recently been published. It contains about four hundred different fruit trees, ornamental and flowering shrubs, herbaceous plants, and bulbous roots. The proprietors state that, in addition to the plants and shrubs enumerated in this catalogue, they have a further collection of one hundred and forty of the most splendid and choice kinds, recently selected from the N. York and Philadelphia nurseries, calculated to please the taste and fancy of connoisseurs, few if any of which have been cultivated in this vicinity. Visitors, at all times, have free access to the gardens, which are situated about four miles from Boston, on the Mill Dam road to Watertown—a pleasant half hour's ride from the city.—*Boston Courier.*

We are happy to see the attention of the public called to the Messrs Winships' Nursery. The fine taste of the Proprietors, their assiduous exertions in collecting every indigenous plant for ornament, and establishing an extensive nursery of valuable fruit trees, are worthy the patronage of the public.

The Messrs Winships have promised to send to the Farmer office, next week, for public inspection, specimens of all their grapes; particularly the Isabella, as there is some difference of opinion among horticulturists respecting its merits, in or-

der that they may taste and decide for themselves, the character of its fruit.—*Ed. N. E. FARMER.*

An acceptable present.—We had the pleasure of receiving this morning, (says the N. York Statesman) from Mr. Parmentier's beautiful garden, near Brooklyn, clusters of grapes of four different kinds, namely:—the Imperial Tokay, of Hungary—the Violet Muscat—the Black Murnier, and the Golden Chasselas. We are glad to find that Mr. Parmentier has succeeded in producing, to perfection, these rare varieties. The flavor of the fruit is delicious. It is hoped public patronage will adequately reward the exertions of the proprietor of this garden, which has been made the repository and nursery of so many rare productions.

The Castine American states, that Samuel Upton, Esq. of that town, has a bull calf, seven months old, measuring from the horns to the tail six feet, and five feet girth. His weight is supposed to be more than six hundred. Mr. Otis Little, Jr. in the same town, has a cluster of cucumbers, five in number, united at the stem end, and of good size. [Mr. Little procured his seed at the New England Farmer office. It is called the Green Cluster Cucumber, an early and productive sort.]

INTEMPERANCE.

The subject of intemperance has engaged the attention of the Agricultural Society of Hamilton county, Ohio; and at their request, Dr. Daniel Drake, an eminent physician and writer, recently delivered a discourse on the desolating effects of intemperate drinking, and on the means of staying this spreading pestilence.—He recommends, among other things, that the use of ardent spirits in families be discontinued, that the absurd custom of offering them to visitors be renounced, that farmers and others should agree not to distribute liquor among those they employ, that the practice of drinking ardent spirits at all public meetings should be denounced and abolished, and that drinking establishments be suppressed.

Dr. Drake says, a too favorable opinion of tea and coffee, as substitutes for ardent spirits, could hardly be expressed. He admits that these infusions sometimes occasion injuries in females and sedentary young men, "but drunkenness is not of the number." He adds: "That their daily use, particularly the use of tea, contributes to the prevention of intemperance, there cannot be a doubt. I have not often seen a tea drinker become a drunkard; and quite as seldom known a man remain temperate who preferred an evening draught of spirit and water to that delightful beverage.—Of every known stimulus, tea seems, indeed, to raise in our faculties and feelings the pleasantest animation." Other substitutes mentioned by Dr. D. are cider, table and family beer, lemonade, &c.

"Of cordials," says Dr. D. "I cannot speak in terms of commendation. They abound in alcohol, rather mixed than chemically combined with other ingredients; and while the latter entice us into excessive drinking, the former produces almost every mischief that can flow from ardent spirits."

"Boys should not be placed as students, apprentices, or clerks, with intemperate men.—This restriction is called for, not less by a regard to the interest of the boy, than the reformation of the intemperate."

"Capitalists, and master workmen of every kind should refuse to employ as operatives or journeymen, all who are given to drunkenness."

Hampshire Gazette.

Economical bread.—Only the coarse, flake bran to be removed from the flour; of this take five pounds, and boil it in rather more than four gallons of water: so that when perfectly smooth you may have three gallons and three quarts of bran-water clear. With this knead fifty-six pounds of flour, adding salt and yeast in the same way, and in the same proportion as for other bread. When ready to bake, divide it into loaves and bake them two hours and a half.

Slap-jacks.—Mix one pint of Indian meal and four spoonfuls of flour into one quart of new milk; add four eggs and a little salt. Bake on a griddle as buck-wheat cakes, and serve hot, with fresh butter.

Influence of the Moon on Plants.—There is an impression very general among gardeners, that the light of the moon has an injurious effect on plants, especially in the months of April and May. M. Arago has shown this notion to be erroneous, but accounts for its general prevalence in a very natural way. ("Annuaire du Bureau des Longs," 1827.) He has demonstrated that, though there can be no reason to suppose that the light of the moon has any direct influence on vegetation, it must follow from the well established principles which govern the circulation of heat, that during clear moonlight nights plants are more liable to be nipped by cold, and turned brown, (whence the name of *lune rousse*, given by the French to the moon which, beginning in April, becomes full either at the end of that month or in May,) than when the nights are dark and cloudy. He refers to the investigations of our own countryman, Dr. Wells, on *Dec*, for the proof of the fact, that exposed bodies may frequently have their temperatures reduced six, seven, and even ten degrees below that of the surrounding atmosphere by the effect of radiation alone; but that when the heavens are obscured, radiation to such an extent does not take place. He then observes, that as the temperature in the months of April and May is often not more than four, five or six degrees above the freezing point, it must follow that, when the moon shines bright, and radiation to its utmost possible extent takes place, the temperature of plants may, by this means, be often brought four, five or six degrees below the freezing point, whilst the circumambient air is above it. Of course, there need be no wonder, that even in the genial month of May, plants should sometimes exhibit all the withering influence of icy December.

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be published to-morrow, the *New England Farmer's Almanack* for 1829. By Thomas G. Fessenden, Editor of the New England Farmer. For sale, wholesale and retail, at the N. E. Farmer office, No. 52 North Market street, by Bowles & Dearborn, 50 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office.

TO THE PUBLIC.

The flattering reception, and extensive circulation with which our first number has been honored, have induced the Editor and Proprietor of the *NEW ENGLAND FARMER'S ALMANACK* to renovated exertions to render the present in some degree worthy of the approbation, which has crowned our diary of 1828.

Our object has been to collect from every accessible source such information as we hope will be found to be of the greatest utility to the greatest number of those whose use an *Agricultural Almanack* is more particularly calculated. But, although this little *Tablet of Time* is specially intended for the benefit of those who are actually and actively engaged in the pursuits of Husbandry, yet it may, perhaps, prove in some degree interesting to other classes in the community. Agriculture is that all in all, without which every thing valuable would soon cease to be. Though all mankind are not cultivators, yet all civilized human beings are consumers of the products of cultivation, and have therefore a direct and paramount interest in the art, to which this little duodecimo is devoted.

The New England Farmer's Almanack for 1829, it is thought will be found to be considerably improved on that of the preceding year; and is enlarged by the addition of eight pages. It contains, besides the usual astronomical articles of an Almanack, a complete Calendar of the Courts for each State in New England, including the Probate Courts for Massachusetts, sun's declination, a table of Roads and distances from Boston, and eighteen pages of Agricultural and Miscellaneous Articles, on the following subjects:—On the Importance of a Good Garden—Hints to Mechanics—a Plough-cleaner, with a drawing—on the Culture of the Yellow Locust Tree—on Working Bulls—on Working Cows—on Purifying Cellars. Apartments, &c.—on Extirpating Cock-roaches—on Preserving Smoked Meat—to Protect Young Plants from Worms—Cheap Machine for raising Water, with a drawing—on the Construction of Gates, by Col. Pickering, with a drawing—on Elder—on Mears' Spring Fastening for Horses, with a drawing—Machine for Cutting Grain, with a drawing—an elaborate article on the Canker Worm—Hints on Fattening Swine—Directions for Gathering and Preserving Herbs, both for medical and culinary purposes—on Lucerne—on Millet—on the Culture of Sweet Potatoes in New England—on Orchard-grass, &c. &c.

Country traders and others supplied on the most liberal terms.

Splendid Bulbous Roots.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, direct from Van Eeden & Co. Holland, a large assortment of Bulbous Flower Roots, comprising the finest varieties of

HYACINTHS—(double and single,) dark blue, porcelain blue, red and rosy coloured, pure white, white with yellow eye, white with rosy eye, and yellow with various eyes; from 25 cts. to \$1.00 each.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots, 3d cts. each.

JONQUILLES—sweet scented, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 3d cts. each.

DOUBLE NARCISSUS—fragrant, of all colours, 19 cts. each.

SPRING CROCUS—of all colours, 6 cts. each, 60 cts. per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 3 10ths in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the mere refuse of the most inferior collections, good roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

A further supply of Lilies, Persian Fritillaries, Iris, Fritillaries, Amaryllis, Star of Bethlehem, &c. is daily expected. All orders faithfully executed.

Spring Wheat.

Just received a few bushels of prime Gibson Spring Wheat, grown in 1829, raised in Southborough, Ms.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box. Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden. Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1824.

Bleaching Salts.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, a further supply of Bleaching Salts, or chloride of Lime, an account of which may be seen by referring to page 101 of the sixth vol. of the New England Farmer.

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

M. Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation thirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordeaux, Clerge, and Buzet, departments of Gironde and Lot and Garonne, in France, (15° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription which he opened on the first of August, 1828.

Mr. A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully clasped and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1/2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 500. Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; and 12 1/2 cents for less than one 1/2 and 18 cents for less than 50 roots. Payment to be made on delivery of the roots, or by bill of exchange, unless post paid.

Subscriptions may be made at N. York, with Alphonse Loubat, 45 Wall street; or at E. Chapelaid, Jr., Albany, R. M. Richards, Philadelphia, Wm. Auringe—Baltimore, Willard Richards—Washington, Wm. Paro, Richmond, Davenport, Albion, &c. &c. or by mail, Hall, Shafter & Tupper—New Orleans, Foster & Clayton—Charleston, (S. C.) J. & J. Street & Co. Mr. A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal bookellers of the United States; and his agents will furnish them gratis to subscribers.

MISCELLANIES.

ODE TO THE HARVEST MOON.

(BY H. KIRKE WHITL.)

Moon of harvest herald mild
Of plenty, rustic labour's child,
Hail! oh hail! I greet thy beam
As soft it trembles o'er the stream,
And gilds the straw that'd hitherto
Where innocence and peace reside;
'Tis thou that gladd'st with joy the rustic throng,
Promptest the tripping dance, th' exhilarating song,
Moon of harvest, I do love
O'er the uplands now to rove,
While thy modest ray serene
Gilds the wide surrounding scene;
And to watch thee rising high
In the blue vault of the sky,
Where no thin vapour intercepts thy ray,
But in unclouded majesty thou walkest on thy way

Pleasing 'tis, oh, modest moon!
Now the night is at her noon,
'Neath thy sway to musing lie,
While around the zephyrs sigh,
Fanning soft the sun-tann'd wheat,
Ripen'd by the summer's heat;
Picturing all the rustic's joy
When boundless plenty greets his eye,
And thinking soon,
Oh, modest moon!
How many a female eye will roam
Along the road,
To see the load,
The last dear load of harvest home.
Storms and tempests, floods and rains,
Stern despoilers of the plains,
Hence away, the season flee,
Foes to light-heart jollity;
May no winds careering high,
Drive the clouds along the sky;
Ere may all nature smile with aspect bright,
When in the heavens thou show'st thy face, oh, Harvest Moon!
'Neath thy lowly roof he lies,
The husbandman, with sleep-seal'd eyes;
He dreams of crowded barns, and round
The yard he hears the flail resound;
Oh! may no hurricane destroy
His visionary views of joy;
God of the winds! oh hear his humble prayer,
And while the moon of harvest shines, thy blustering whirlwind spare.

Sons of luxury, to you
Leave I sleep's out-pow'r to woo;
Press ye still the downy bed,
While laxish dreams surround your head;
I will seek the woodland glade,
Penetrate the thickest shade,
Wrapt in contemplation's dreams
Musing high on holy themes,
While on the gale
Shall softly sail
The nightingale's enchanting tune,
And oft my eyes
Shall gratefully rise
To thee, the modest Harvest Moon!

From Bishop Heber's Poems.

CINNAMON-FIELDS OF CEYLON.

Our morning was, as usual on a first arrival, taken up by visits: in the afternoon, we drove in Sir E. Barnes' society through the fire-burned cinnamon gardens, which cover upwards of 17,000 acres of land on the coast, the largest of which are near Colombo. The plant thrives best in a poor, sandy soil, in a damp sunny place; it grows wild in the woods to the size of a large apple tree, but when cultivated is never allowed to grow more than ten or twelve feet in height, each plant standing separate. The leaf is something like the laurel in shape, but of a lighter color; when it first shoots out it is red, and changes gradually to green. It is now out of blossom, but I am told that the flower is white, and appears when in full blossom to cover the garden. After hearing so much of the pepper-gates from this island, I was not a disappointed at not being able to discover any scent, at least from the plants, in passing through the gardens: there is a very fragrant-smelling flower growing under them, which at first led us into the belief that we smelt the cinnamon, but we were soon undeceived. On pulling off a leaf or a twig you perceive the spicy odor very strongly, but I was surprised to hear that the flower has little or none. As cinnamon forms the only considerable export of Ceylon, it is of course preserved with great care; by the old Dutch law, the penalty for cutting a branch was no less than the loss of a hand; at present a fine expiates the same offence. The neighborhood of Colombo is particularly favorable to its growth, being well sheltered, with a high equable temperature; and as showers fall very frequently, tho' a whole day's heavy rain is uncommon, the ground is never parched.

COMBUSTION OF THE HUMAN BODY.

In May last, M. J. Fontenelle read in the Academy of Sciences at Paris, a memoir on the spontaneous combustion of the human body. M. F. establishes incontestibly the reality of the phenomenon, and relates fifteen observations of spontaneous human combustion. Most of the fifteen persons who took fire spontaneously and were consumed, were women immoderately addicted to the use of spirituous liquors. In all cases, the body and viscera were burnt, while the feet, hands, and top of the head escaped. The combustion takes place in those who are the prey of a violent internal heat—the presence of a burning body is not necessary to produce spontaneous combustion, and water, so far from extinguishing the flame, seems to render it more active—the fire does not burn combustible objects placed near it—two persons were consumed at the same time, in the same apartment, without burning the furniture or the apartment—the body consumes in a few hours, and what remains consists of greasy ashes and soot, having a fetid odor which extends to a great distance. M. Fontenelle thinks that spontaneous combustions of the human body originate from a degeneration of the muscles, tendons, viscera, &c. which gives rise to new products of a highly combustible nature, the reaction of which determines the combustion of the body. Alcohol contributes with other causes to produce this degeneration.—*Hampshire Gazette.*

INUNDATIONS IN ENGLAND.

The inundations occasioned by the constant heavy rains in Flintshire and Denbighshire have proved most injurious, and in some instances destructive, to the iron works in those counties. It is stated by the oldest inhabitants in the neighborhood, that such awful effects from impetuous torrents were never before witnessed by them.

The Stamford paper says it is lamentable to witness the havoc which the rains have created in the agricultural prosperity of the country. The overflowings of the rivers in Cumberland, Northumberland, Durham, Yorkshire, Lancashire, Nottinghamshire, Lincolnshire, &c. where the banks admitted of it, have flooded the adjoining country. Manufactories have been undermined and overthrown, bridges and buildings swept away, and many lives lost.

Hay and clover are so much injured, that the latter has risen 10s. a ton. Wheat in our market has advanced from 3 to 4s. per quarter. So copious have been some of the showers in Yorkshire, that in many places the water rose six feet in two hours. In Hockensess, from twenty-five to

thirty miles, the country presents one almost unbroken sheet of water. The produce of thousands of acres is literally rotting in the ground. The Glasgow Chronicle notices the dreadful effects of the rain in Scotland. The crops in France have all suffered from a similar cause.

The Liverpool Mercury, of the 1st of August, says, "We continue to receive, from all parts of the kingdom, accounts of the disastrous consequences of the late heavy rains, and serious apprehensions are generally felt for the coming harvest."

Children's shoes.—Children's shoes ought to be made large and easy, as their feet are rapidly expanding—and shoes which at present fit, will pinch in a month. Hence are produced doubling of the toes—painful corns—curving of the nails into the quick, and often, headache and general disorder. Shoes for daily wear should never be thin; such shoes do not protect the feet in walking; and instead of encouraging a firm, manly step, give rise to a timid, hobbling gait, which is extremely uncouth.

Unhealthiness of the Country.—While our city has thus far been exempt from any prevailing epidemic, we regret to learn that the surrounding country has been afflicted with numerous cases of autumnal fevers. The prevalence of bilious remittents and intermittents may be ascribed to the luxuriance of the season, and the decomposition of an unusual quantity of vegetable matter.—*N. Y. pap.*

Large cucumber.—Dr. Norwood, (says the Portsmouth Journal) has taken from his garden in Exeter, N. H. a cucumber which measured seventeen inches in length, fourteen inches in circumference, and weighed five pounds and one ounce.

Cement for wood or paper.—Dissolve some isinglass in a small quantity of gin or proof spirit, by a very gentle heat; and preserve it in a bottle for use.

Oat Meal, Oat Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine Bolled Oat Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few canisters of fine Oat Flour, neatly packed, at 50 cts. per canister.

Gunpowder, &c.

De Pont's Gun Powder, at 25 to 50 cts. per pound—Shot—Balls—Fling, and Percussion Caps.

Also Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the Dupont Powder Store, No. 65 Broad street—By E. COPELAND, Jr.

The De Pont sold as above, is warranted first quality—and is marked "E. Copeland, Jr. Boston," on the head of the cask. if March 13

Hemp Seed.

Just received at the New England Farmer Seed Store No 52 North Market Street, A consignment from Troy, N.Y. of 50 bushels of Hemp Seed, growth of 1827; by the nerve or bushel.

Subscribers to the New England Farmer can have their volumes neatly bound and lettered at 75 cents, by sending them to this office.

Seeds for Fall Sowing.

For sale at the New England Farmer Seed Store, a fresh supply of various Grass Seeds—also a great variety of vegetable seeds for fall sowing, viz. White Portugal Onion, Strasburg do, Silver skin do, Prickly Spinach, and Dutch Cole for early greens—various kinds of lettuce, cucumber, cabbages, &c.—black Spanish or water radish, &c. all warranted fresh.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscription are entitled to a deduction of fifty cents.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

PEACHES.

MR. FESSENDEN.—The following plan has been adopted by an agriculturist who has for several years sent the best peaches to New York, which have been raised in that vicinity. When the trees begin to blossom, large piles of combustibles are placed in different parts of his orchard. They are composed of those materials which burn slowly, and produced a dense smoke. When there is any reason to expect a frost the piles on the windward side of the orchard are ignited towards evening, and kept in a state of combustion through the night. He thus keeps the orchard filled with smoke, and the temperature of the air so far above that of the surrounding grounds, as to exclude the frost from his trees; and in this manner has succeeded in securing his fruit, while that of trees exposed to the effect of the weather has been entirely cut off.

BEEES.

An intelligent mechanic in the neighborhood of Hartford, who had, previous to his removal to that vicinity, attended much to the management of bees, informed me that he had secured his hives from the attack of the insect, by laying on the floor of the hives, early in the spring, a quantity of salt. This he sometimes renewed in the course of the season, though usually one application was sufficient. The bees appeared to be fond of the salt, and escaped entirely the injury which others, not thus protected, suffered from the worm.

FOR THE NEW ENGLAND FARMER.

YELLOW LOCUST.

MR. FESSENDEN.—I am apprehensive it is not so generally known as it ought to be, that there is an essential difference in the qualities of the locust tree of our groves and forests. And should it be conceived that some kinds are more valuable than others, too indefinite and vague are the ideas which generally prevail on the subject.

The merchant, the manufacturer, and the farmer have frequent occasions to use this sort of timber, and from its general reputation, do not hesitate to give a high price for it, without any regard to the kind or quality of the wood, they purchase, hence a sad disappointment is frequently the consequence. Michaux, in his *North American Sylva*, as quoted by you, says, "those trees are reputed best whose hearts are red. The next in esteem are those with a greenish yellow heart—and the least valuable are those with a white heart. From the variety in the color of the wood, which probably arises from the difference of the soil are derived the names, red, green, and white locust." He here acknowledges a difference in the value of the various colored species, but I think he is mistaken in assigning as the cause of this, the soil on which they severally grow, as the different kinds in this region at least, grow promiscuously; often you will see the yellow and the white or grey the only two varieties found among

us, growing side by side. It is possible that one kind of soil may be more congenial to the growth of one variety than it may be to the other, and here in one tract of country large quantities of the yellow may be found, and the reverse of this in another region.

The fact of the heart of the locust being red, green, white, or even yellow, does not stamp a particular value on the timber, as that kind with a different colored heart from the wood is found to be least valuable, often if not always denoting a state of premature decay. This is almost always the case with the white locust, on cutting which, though quite young and apparently thrifty, the heart in different degrees will be discolored; and if the tree be old, the same part will be found rotten or hollow. The reverse of this is the case of the yellow locust, the wood of which when recently cut exhibits a fine yellow appearance but gradually changes to a greenish yellow after having been worked a short time, the heart being of the same color, remains sound although the tree may be dead through age or some other cause; it shews no appearance of a rot.

Two venerable old yellow locusts, one of which were burnt to charcoal, and the other house to which they formed a chimney, were cut by the British when they first landed in this country. The revolutionary war, are now still standing, and by their want of bark on the top, and the fact that the trunk is sound. Though the wood is somewhat dry indeed, still they put forth roots and new branches annually and appear to be in a flourishing state. Now the fact of there being "a permanent specific difference" in these two different varieties as it respects their durability at least has been tested, times without number. The white, or as it is often called grey locust, when used for posts or sills of buildings, will in the course of ten or twelve years, be found in a complete state of decay, whereas the yellow locust may be said to be almost imperishable when used exactly in the same circumstances.

A corner post to one of our streets of this latter kind of wood, which was set out before the war of the revolution, at least fifty-five years ago, was a few years since taken up in a perfectly sound state, and now supports one of the sills of a dwelling house in a cellar in this village. Innumerable facts of this kind may be produced if necessary, to substantiate the superiority of the yellow over the white, which last is only fit, neither is it used* in this vicinity for any other purpose but for wood, for which it is in as high repute as walnut or hickory. To a person unacquainted, it might be somewhat difficult at sight to distinguish the two different kinds, but one or two blows of the axe will decide the point; the chips are of a dif-

* During the late war, one of our old and respectable ship owners and formerly ship master was on a visit to the navy yard in Charlestown, and being in company with the superintendent, he observed a carpenter hewing a stick of white locust. He said to the officer, "you do not put such wood into your ships?" "Why not?" was the answer, "it is locust." "Truly—but that kind of locust we consider no more valuable or fitter for ship building than any inferior timber?" and further he explained the difference of the two species of locusts, &c. &c. Suffice it to say that the old gentleman received any thing but polite treatment for his presuming to differ from the prevailing genius of the place.

ferent color; the white or grey is more soft and supple in a green state; the bark in general is thinner and smoother, and peels off more readily. It seems to be a fact that the locust tree does not blossom every year and when they do put forth the seeds are not apt to come to maturity. Much care ought to be taken by those who wish to propagate the locust, to select the genuine yellow kind, and then the seeds ought to be swelled in hot, or some have used boiling water, before planting to ensure their speedily coming up.

LEMUEL W. BRIGGS.

Bristol, R. I. Sept. 26, 1828.

MACHINE FOR TRANSPLANTING TREES.

The June number of the *Gardener's Magazine* contains a review of Stuart's Planter's Guide, by Mr. James Main; and gives the following cut and description of a machine used in England in transplanting large trees:

The reviewer states in substance, that with full command of men, horses, and machines, many trees of various heights, from fifteen to forty feet were transplanted by the means of a common timber truck. Or for the largest trees, with much earth attached to their roots, "we had a low oaken sledge, five feet by four, running on low block wheels before, and resting on smooth iron slides behind. On this, after the tree was pulled down, the root was rolled like a wheel, by involving chains fixed as low as possible on the opposite side, by a horse or two, driven steadily. When such weighty trees were drawn to the hole where they were intended to stand, and rolled off the sledge into one side of it, the tree was raised by two horses with the utmost ease, by means of two poles twenty feet long, crossed, and

made fast together about two feet below their upper ends. Over this crossing the rope by which the tree was pulled down, (being still attached) was passed; the poles were then elevated across the line of draught, (which was directly from the butt of the tree); the horses were hooked to the end of the rope, and gently moved forward; and thus, from the elevated direction of the rope from the tree to the crossing of the resisting poles, brought the tree upright. In raising a tree in this easy way, a little judgment is necessary in preparing the poles two or three yards apart at the bottom, that they may lean rather towards the tree till they receive the full strain in the draught, and that they may be at such a distance behind the horse as not to drop on him in their fall when the tree is up."

THE CURCULIO, OR WORM IN FRUIT.

The following was written in answer to an inquiry respecting the Curculio or worm, which it has been supposed injures the fruit grown in New

MISCELLANEOUS.

not less than one third part of its value. The inquiry was received from a respected scientific correspondent, and the answer below was from a gentleman, who has often benefitted the public, and obliged us by his communications, and the results of his researches in Entomology.

(To the Editor of the New England Farmer.)

The worm found in plums and other stone-fruits is the larva of a weevil, and apparently the same as that described by Prof. PECK, in the *Ms. Agr. Journal*, for Jan. 1819. Prof. PECK, calls his insect *Rhyncerus cerasi*, and says that he obtained it from excrescences on the limbs of the cherry trees, and that it proved to be the same which was known to occasion the fall of peaches, apricots and plums. From the latter fruit I obtained the perfect insect, differing in no respect from that described by Prof. PECK. It is about the size of the pea-bug, variegated with brown and white, the thighs with two teeth beneath, and the wing-shells covered with 10 or 12 tubercles, 4 of which, in the middle, are polished black, and larger than the rest, 2 of them conspicuously so. I am informed that the German entomologist Herbst has described this insect by the specific name of *Nemophar*; but having no copy of his works, I cannot vouch for the correctness of the information, nor detail any remarks which he may have given respecting it. A paper by Mr. Tilton on this insect was first published by Dr. Mease in his *Domestic Encyclopedia*, from which it has been repeatedly republished in the various horticultural treatises of this country.

Melshimer in his catalogue observes that the larva lives under the bark of the peach tree, and we have Prof. Peck's authority for the fact that it is the cause of the excrescences on the cherry-tree; it probably is also the same that deforms the limbs of the plum-tree.

According to several memoranda the perfect insect is found during most of the spring and summer months, but it first appears in May, when it commences puncturing the small fruit with its proboscis, and deposits, in the puncture thus made, an egg, which in process of time becomes a maggot or worm, that causes the premature fall of the fruit. The worm then easily escapes into the earth, becomes a pupa, and returns to the surface in its perfect state in about three weeks. Now this metamorphosis may take place at various times during the last of summer or beginning of autumn, when the perfect insect, finding no young fruit, is compelled to oviposit or lay its eggs in the small branches. The larvae live in the branch during winter, and are not perfected till near the last of the ensuing June. Should, however, the fall of the fruit occur late in autumn the development of the perfect insect is retarded till the next spring, whence arises the brood which oviposits in fruit.

It is a singular circumstance, and one which hitherto has not been sufficiently explained, in the history of this insect, that some broods should attack the limbs, and others the fruit. In this is manifest the wisdom of the Author of nature in providing for a continuation of the species in various contingencies. By this wonderful compensating contrivance in its economy, this little creature is secure of an appropriate nidus for its future progeny in sterile regions and unfruitful seasons.

Such, in brief, are the habits of this insect; and these being known, the way for successful experi-

ment is opened. Not having made any myself, it must be left to others to devise and point out a remedy against the injuries of this depredation.—The following, which has already been suggested appears to me most likely to be successful.

1. To extirpate the diseased nodes or excrescences in June, and burn them, as directed by Prof. PECK; and

2. To collect all fallen stone-fruit, and give it to hogs:—

To which may be added that the fruit should not be suffered to remain long on the ground; that it should be boiled or steamed in order, effectually, to destroy the contained larvæ; and that the above processes should be *universally* adopted in order to exterminate this destructive insect.

SCRUTATOR.

Milton, Oct. 1, 1828.

FOR THE NEW ENGLAND FARMER.

NEW FRUIT—HEATHCOT PEAR.

Messrs Winslips of Brighton.

GENTLEMEN—Conformably to your request, I send you a specimen of the *Heathcot Pear*; as you expressed a wish in the early part of the summer of having some of them sent to the New England Farmer office, for exhibition, where Horticulturists could have an opportunity of judging for themselves.

This fine and handsome fruit is the produce of a native tree, in the garden of the Hon. CHRISTOPHER GORE. The tree is now twelve years old; and first bore fruit in the year 1821, since which it has uniformly borne a good crop, the present season to excess. It resembles in appearance and richness of flavor the *St. Michaels*, though much larger; of a beautiful yellow or straw colour, tinged with red on that side facing the sun, intermixed with clusters of small black spots. The fruit is highly flavored, and justly claims its place amongst the *first* pears in the country, viz. the *Suckle, Bortlett, &c.* I have named this pear after the good old gardener, who raised it from seed.

Since this tree came into bearing it has not suffered by the diseases incident to many pears.—The fruit this year is smaller than it has been heretofore, owing to the immense quantity it has produced.

Sir, I am yours, &c.

R. TOOHEY.

The above mentioned pears have been received at the office of the New England Farmer, through the hands of the Messrs. WINSLIPS, and pronounced by good judges to be of a very superior quality.—EDITOR.

FOR THE NEW ENGLAND FARMER.

FINE FRUIT.

MR. FESSENDEN,—The cause in which you are enlisted, is my inducement and apology for sending the accompanying box containing a dozen of pears, produced by an engrafted sucker, from the roots of a tree said to have been introduced by *Phillippe L'Englois*, about one hundred and seventy years since; the original tree disappeared. I am sure, more than twenty-five years ago. If you consider the subject worthy inquiry, I shall be ready to answer all in my power.

Your obedient servant, L. H.

Salem, Sept. 25, 1828.

The writer of the above will accept our thanks for the pears which arrived in good order;

they were of a rich and melting quality, and considered by our horticultural friends to be the *St. Michaels*, or very similar to them.—EDITOR.

FOR THE NEW ENGLAND FARMER.

HORSE CHESNUTS—Query.

MR. FESSENDEN,—If you are in possession of the art of cultivating that beautiful tree with which your city abounds, (the horse chesnut) I shall esteem it a great favor to be informed of it—as I have repeatedly planted the chesnut but never had the pleasure to see any of them grow. I have used various ways, and different soils, but with no success. I have taken a great deal of pains in a number of instances, to procure the nuts and plant them, as I esteem them more than any other ornamental tree.

Yours, respectively,

L. JENKINS.

Carandaigua, Sept. 25, 1828.

It is often the case that seeds lose the power of vegetating in consequence of being kept out of the ground too long after they become ripe—particularly tree seeds. A friend assures us that he has succeeded in raising the horse chesnut, and that his method was to plant the seeds in manure, or rich compost in autumn. Nature generally sows the seeds of trees in autumn; and, if art would more frequently imitate nature in her processes, they would be attended with fewer failures.—EDITOR.

MR. FESSENDEN—Observing a notice in your last paper, of a large calf raised by Mr. LITTLE, of Castine, I would observe that a neighbor of mine has one of the Durham Short Horn breed, but 6 weeks old, which measures 4 feet 9 inches in length, and 4 feet girth. It is thought the size of the calf might easily have been enlarged, as it discovers a great propensity to fatten.

Yours, &c. DORCHESTER.

LOCUST WOOD.

MR. FESSENDEN—With this you will receive several pieces of Locusts, as samples, marked as follows:

A—Is a small piece of the sill of a building erected about 120 years ago, by Col. McIntosh, on the Mount Hope Farm in this town, and was at first used as an Episcopal Church. A few years since this building was taken down, and the sills and other timbers of locust in the like good state of preservation, were re-framed into another building.

B—No. 1—Is a small sample from the butt of a yellow locust tree cut two months since, and from its concentric circles would appear to be thirty or forty years old.

No. 2—Is another piece from the same tree of No. 1, taken twenty feet from the ground. No. 3 are blocks and chips from the same tree.

C—Is a block of *White* or *Grey Locust*, taken from a tree cut the past winter and sold for posts. This piece was taken about 20 feet from the butt of the tree which was hollow a considerable distance up. You will perceive that its heart is in a state of decay. One more characteristic of the white locust which I ought to have mentioned is that the white locust is a very *sour* and *sappy* wood, and though cut young and showing no signs of decay from that cause, it soon passes into that state. Yours, LEMUEL W. BRIGGS.

WHITLOW—how to treat it.

This disease is often a severe affliction to hard working men, such as farmers. It originates from bruises or punctures which inflame the muscles, tendons, or membranes beneath the skin; these swellings, whilst the hard tough skin of the fingers remains unyielding, cause the greatest pain, and extension of it up the arm. The thick skin of the fingers also prevents any exudation or escape of the purulent matter, and thus the bone becomes diseased, and a joint is often lost. Persons with soft fingers are seldom attacked. An artificial and similar disease may be formed at any time by winding a string round an inflamed finger, or by sewing it up in a piece of unyielding leather. In this case the most stupid person would think only of cutting the string or ripping the leather, and yet it is rarely that you see a physician go to work in this rational manner. He must first salve it with ointment, which is just as likely to make a cure as the treading on it, that is practiced by ignorant people before it becomes intolerable—by such practices and such neglect, the disease of it runs on till nature makes a gap, and the physician modestly charges for what another has done. The proper remedy is simple and easy—lay open the thick skin, the whole length of the swelling, and dress the finger for one or two days with a soft poultice of bread and milk, and then lay lint on the wound; a little red precipitate ointment may be necessary, where the proud flesh does not suppurate freely. The writer of this has relieved a great many persons without the loss of a joint, and has followed no other plan for twenty years.

MEDICUS.

THE FORMATION OF ANTHRACITE COAL.

It has long been a desideratum with the scientific, to obtain further data on which to form opinions concerning the formation of coal in mines.—If we mistake not some light is thrown on the subject, at least so far as relates to the anthracite beds and mountains in this country, by a discovery accidentally made in this city, among some coal from the Peach Orchard mine, on the Schuylkill river. Mr. Reeve, who keeps his coal for sale at his office in Canal street, and at the corner of Murray and Washington streets, has found, within three or four days, two masses which contain lumps of a substance resembling charcoal in all its exterior qualities, and which we have no doubt is charcoal. We have seen specimens in which the anthracite appears to pass almost imperceptibly into charcoal, and others where the division line is clearly drawn—in some the charcoal is disseminated in spots, in others traversed by veins of hard, shining anthracite, while what seems the upper surface, presents an unbroken shell of anthracite. In one case, we were assured, the beautiful play of colors, for which the coal from that mine is so remarkable, extended into the charcoal. In specimens which we have seen, the fibre of the wood is perceptible—sometimes coarse, like that of chestnut; sometimes separating at an angle, as at the sprouting of a branch, and sometimes fine and undulating, like the grain of an old maple trunk.—*N. Y. Daily Adv.*

Cure for the bilious cholera, and the dysentery. By Dr. Usher, of Connecticut.—Dissolve in keen vinegar as much common table salt, as will, when put into an open bottle, ferment and work itself clear. The bottle should be nearly full, that it may dis-

charge the foam; this done, bottle it for use; let the person affected, take a large spoonful of the vinegar in about a gill of boiling water, or as hot as he can drink it, until he finds relief. It will effectually remove the cause, (says the recipe) although the patient may be so far relaxed and exhausted as to die with weakness. The same remedy is said to be excellent in the common cholera.

Rail-roads are increasing in England.—“We have before us animating accounts of the opening of the Lancashire, (England,) Bolton and Leigh Rail-road.” A large concourse of persons attended and partook of a prepared repast. We must reserve the details for another day, having at present room only for a short extract or two which follow.

Opening of the Bolton and Leigh Rail Road.—Yesterday, this great and useful undertaking being nearly completed, the road was opened in form, by the passage over it of a chained row of coal carriages, some of which were tastefully fitted up for the reception of a select company of the friends of the proprietors, drawn by a locomotive steam engine.

We venture to announce this as one of the most important and decisive triumphs of modern science.

Attached to this locomotive engine were seven wagons, elegantly embroidered inside, strongly and heavily built, each containing a steward and a dozen to eighteen persons, and some females.—Linked to the list of these was a ponderous vehicle, a coach built for the Liverpool and Manchester Company, built on the French *diligence* system. It is intended to carry sixteen inside, and four outside; but on this occasion there were at least a dozen on the roof. Immediately after came six more wagons, also filled with company; the last one containing the members of the Bolton old band, who played various national airs and marches at intervals.

A belief was entertained and expressed, that Rail-Roads with locomotive engines would supersede the use of Canals in England.—*Penn. Gaz.*

The Belchertown paper mentions that apples are so plenty in that town, that the price of cider will hardly pay for the labor of making it. In this vicinity there is far from being such an abundance, and cider bears a high price. We must have a RAILWAY. If there was one at this moment, running through or near Worcester and Belchertown, the farmers of the latter place would not be obliged to see their apples rotting under the trees. They would easily find a market, and a profitable one.—*Worcester Freeman.*

To convey fish.—A crumb of bread is to be soaked in brandy; and when swelled, the fish's mouth is filled therewith, into which a half glass more of the spirit is then to be poured. The fish remains motionless, and as if deprived of life, in which state it is to be wrapped in fresh straw, and afterwards in cloth. In this condition they may be kept, or conveyed to any distance for eight or ten days. When arrived at the place of destination, they must be unpacked, and thrown into a cistern of water, where they remain a quarter of an hour, or sometimes an hour without shewing any sign of life; but at the end of that time they disgorge very abundantly, and recover their life and ordinary motions.—*Archives of Useful Knowledge.*

Dying cotton blue.—Take one pound of good indigo, boil it in middling strong ley for two hours, pour off the ley, and rinse the indigo with a little water, then grind the indigo in a clean pot with a cannon ball, or something similar, till its begins to turn to mud. Pour in a little water, and wash out all that is mud into a clean bowl, and so continue till all the indigo is converted to mud. Take three pounds of shell lime, slack it in about two quarts of milk-warm water, in a clean bowl by itself. Take one pound of good green copperas, melt it with milk-warm water, also in a bowl by itself. Have a stand similar to a churn, prepared with ten gallons of clean water in it, into which pour your three different bowls of ingredients at once. Commence churning, with a common churn staff, immediately; churn about half an hour, or till the water turns a yellow green color. Just before you finish churning, throw into your stand a full tea-spoonful of powdered yellow arsenic—let it stand twenty-four hours and it is fit for use. When you have dyed about half a pound of thread,* you must churn a little, and let it stand two hours before it is fit for use again. Boil the thread in clean water before you dye it, to cleanse it, and let it be dampened with warm water before you dip it. Make use of rain or soft water in all your process.

* Which is done by passing the hanks of thread over your hands, letting it hang in the dye; which may be repeated at small intervals after the thread is nearly dried.

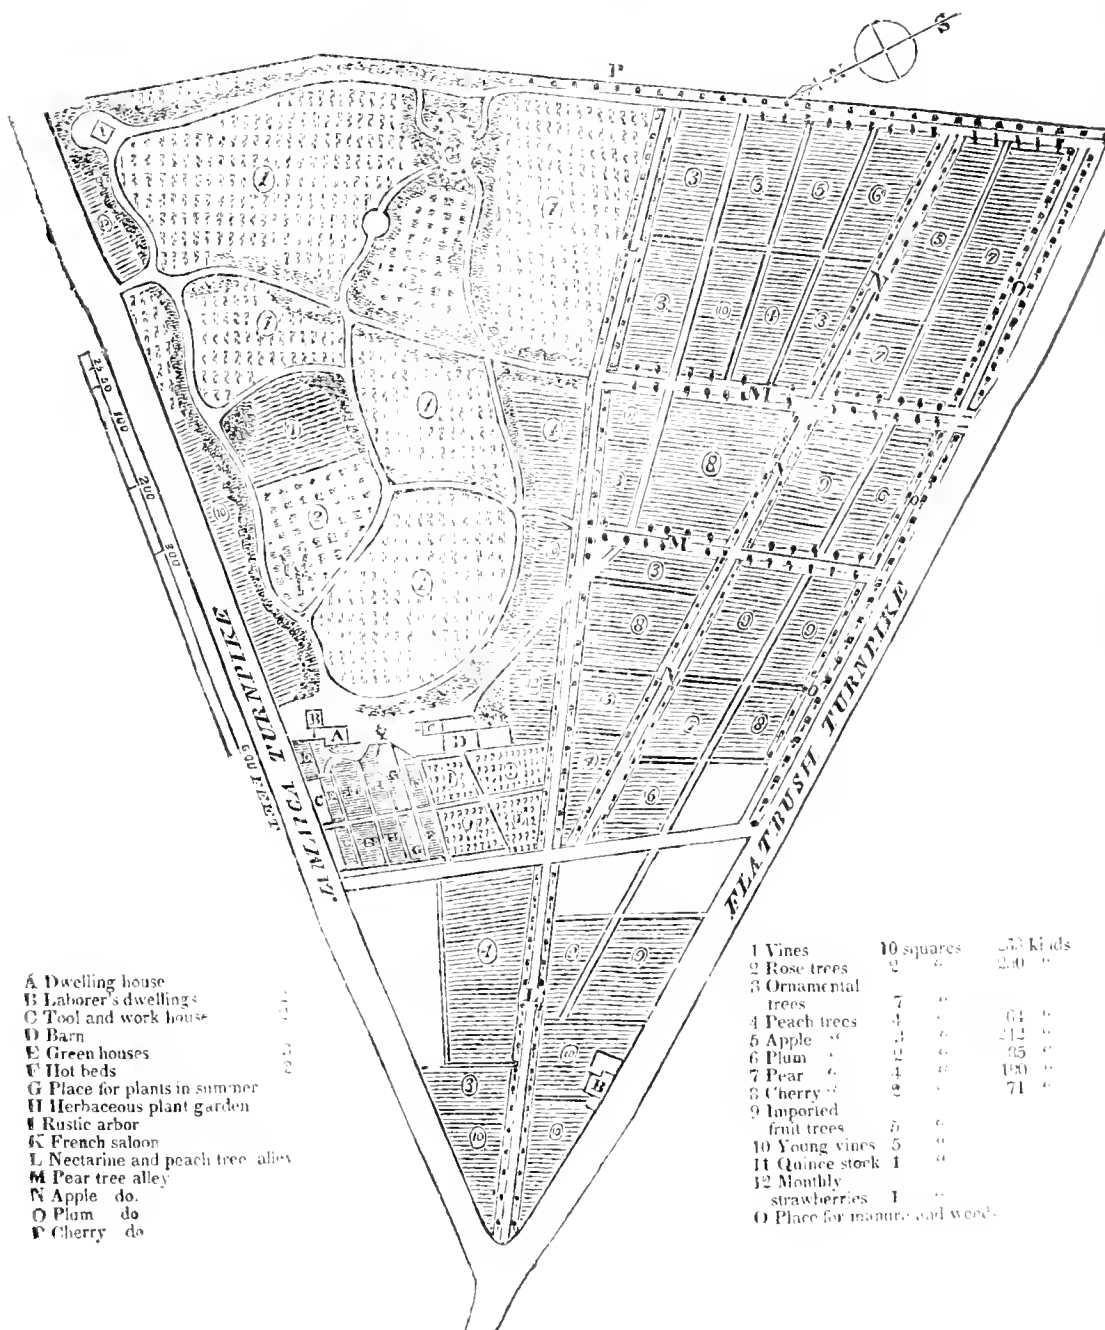

Tortoise shell.—Few of the tender sex, it is to be presumed, are aware of the barbarous method by which this highly priced article is obtained. When the tortoise is caught by the Eastern Islanders, it is suspended over a fire kindled immediately after its capture, until such time as the effect of the heat loosens the shell to such a degree, that it can be removed with ease. The animal now stripped and defenceless, is set at liberty, to re-enter its native element. If caught the ensuing season, or at any subsequent period, the unhappy animal is subjected to a second ordeal of fire, but rewards its captors this time with a very thin shell.

An experienced farmer of Shawangunk, (says the Ulster Sentinel) recommends what is called the *hurley weed*, as an effectual cure for the slabbering of horses—they will eat it readily, (he says) and a handful or two will put a stop at once to the disagreeable and debilitating malady.

How to pickle walnuts.—Scald slightly, and rub off the first skin, of a hundred large walnuts before they have a large shell; this may easily be ascertained by trying them with a pin. Put them in a strong, cold brine—put new brine the third and sixth days, and take them out and dry them on the ninth. Take an ounce each of long pepper, black pepper, ginger, and allspice; a quarter of an ounce of cloves, some blades of mace, and a table spoonful of mustard seed—bruise the whole together—put into a jar a layer of walnuts—strew them well over with the mixture, and proceed in the same manner till all are covered. Then boil three quarts of white wine vinegar with sliced horse radish and ginger, pour it hot over the walnuts and cover close. Repeat the boiling of the vinegar and pour it hot over, three or four days, always keeping the pickle closely covered; add at the last boiling a few cloves or garlic, or shallots. In five months they will be fit for use.

From the New York Farmer and Horticultural Repository.

One of the best planned and best executed models of a garden which we have visited, is the establishment of Mr A. PARMENTIER, about two miles from Brooklyn. The preceding map will serve to convey some idea of the general disposition of the whole, but we are confident that no plan nor description can furnish an adequate image of this delightful spot. We look upon it as an era in the history of our Horticulture. We do not mean to assert by this that the various branches of this science were not understood and practised by most of our gardeners before the arrival of Mr P. The villas and country residences of many of our citizens, and our markets and fruit shops are abundant evidence that both the ornamental and useful branches of the art were successfully pursued among us in the tasteful embellishment of landscape scenery, and in the abundant production of the finest fruits which any climate can boast of. But we do not know of an instance where the several departments of the gardener's labors are combined so extensively and with such scientific skill: nearly twenty-five acres of ground are enclosed, and the inhabitants of the vicinity, and those who recollect the original scite of the garden, now view with astonishment, in the short space of three years, one of the most stony, rugged, sterile pieces of ground on the whole Island, which seemed to bid defiance to the labours of man, now stored with the most luxuriant fruit and blooming with the most beautiful flowers.

The ground plan of the garden, though nearly level, has considerable diversity of surface; the most elevated part facing the south and south-west, is appropriated for the purpose of a vineyard, and the most valuable varieties of the grape foreign as well as indigenous, are here cultivated. The beds of the flowering or ornamental part compose broad belts laid out in a serpentine or waving direction, and edged with thrift, (*statice armeria*). We have never seen this plant applied to this purpose so extensively, and if it could retain the beautiful appearance throughout the season, which it exhibits in the first summer month, with its delicate pink blossoms, it would afford the finest possible material for a border, which could be employed; but it does not long remain in flower, and its verdure is inferior to the box, which is commonly used for that purpose.

Nothing can exceed the effect of the contrast in color and form in the various flowers and shrubs of these sections, and the delicate foliage and rich blossoms of many of our native plants are not among the least attractive in this assemblage, arranged at frequent intervals. The several species of *Rubria*, the *Philadelphus grandiflorus*, the *Halesia*, the *Ptelea*, and many others conspicuous for their beauty,

interspersed and contrasted with the delicate *Tamarix*, of Europe, the *Paper mulberry* now bearing its curious fruit, and the several species of shrubby willows, and poplars; the splendid *Anchusa capensis* with its azure blossoms, and the no less luxuriant *Balsamine*, and thousands of others which we might mention, are all disposed in the most artful manner to heighten the effect, and at the same time to conceal the appearance of art.

In the Northern parts of the garden are contained the nurseries; samples of each kind of tree which are kept in the nurseries are distributed in the beds. To the left of the garden an avenue leads to a Rustic Arbor curiously constructed of the crooked limbs of trees, in their rough state, covered with bark and moss; from the top of this arbor a view of the whole garden, and the surrounding scenery is exhibited, extending to Staten Island, the bay, Governor's Island, and the city; at some distance from the rustic arbor is the French saloon, a beautiful oval, skirted with privet, *Ligustrum*, kept dwarfed to the height of a foot and enclosing a solid mass of China monthly roses. The various kinds of fruit trees are carefully arranged, and the lanes leading to them are skirted with the different species in a bearing state, for better exhibition, and to furnish the necessary grafts for the establishment.

The green-house department, although not so extensive as some in our vicinity, contains many beautiful plants exhibited with the same tasteful arrangement which characterizes the whole of Mr. Parmentier's establishment; even the method in disposing the pots according to some principle of grouping or contrasting the color and size of the flowers, entertains the eye, and shows the variety of ways in which a skillful gardener may distribute his materials to produce picturesque effect.

The manner of protecting the plants from the violence of the weather, or the heat of the sun, is quite novel; canvass covers being so managed as to be rolled or unrolled with the greatest ease and despatch by means of ropes and pulleys; the necessity of some such screen is quite obvious, when plants and particularly tender exotics are exposed to our excessive sun, and yet it is too generally neglected among our gardeners.

We are gratified in recommending this establishment as one of the few examples in our neighborhood, of the art of laying out a garden so as to combine the principles of the landscape with the conveniences of the nursery or orchard; and every proprietor who may have a piece of land which he wishes to arrange and embellish in this manner may find it to his advantage to consult Mr. PARMENTIER.

French mode of making brandy peaches.—Preserved fruit is generally clogging and oftentimes unwholesome, in consequence of its unmixed sweetness. The following is the French mode of preserving peaches, said to be preferable to any other: Scald your peaches in hot water, then dip them into strong lye, rub them with a cloth and throw them into cold water—make a syrup of three-fourths of a pound of sugar to one pound of fruit—and when cold put an equal quantity of brandy.

Chestnut bark.—The bark of the chestnut tree contains twice as much tanning matter as oak bark, and nearly twice as much coloring matter as logwood. The coloring substance of chestnut

bark is to that of Campeachy logwood exactly as 1.857 to 1. Leather prepared with this substance is more firm and solid, and yet more supple. This bark is the best substance for making ink; mixed with iron, it becomes a bluish black. The liquor drawn from this bark appears blue at the outside like indigo; but it gives on paper the finest black. In dyeing it has a greater affinity for wool than sumach, and gall-nuts. The color obtained from this substance is unchangeable by air and light.

YEAST.

The following methods of making yeast have been recommended.

1st. Boil one pound of good flour, a quarter of a pound of brown sugar, and a little salt, in two gallons of water for one hour; when milk warm, bottle it and cork it close; it will be fit for use in twenty-four hours. One pint of this will make 18 pounds of bread.

2d. To a pound of mashed potatoes, (mealy ones are best) add two ounces of brown sugar, and two spoonfuls of common yeast; the potatoes first to be pulped through a cullender, and mixed with warm water to a proper consistence. Thus a pound of potatoes will make a pound of good yeast. Keep it moderately warm while fermenting. This recipe is in substance, from Dr. Hunter, who observes that yeast so made will keep well. No sugar is used by bakers when adding the pulp of potatoes to their rising.

From Elot's Field Husbandry

IMPROVEMENT OF MEADOW LAND.

The drained land hath succeeded so well these two years past, that the same land which might be bought five or six years past, for six pounds per acre, will now sell for an hundred pounds per acre; nay, even although it be not cleared of the wood and brush, provided the growth be killed with previous flowing.

By the way, I would observe, that if a swamp be full of small brush, and but few great trees, the cheapest and best way is to flow it, and kill it with the water; but if there be but little small brush, and the land be very thick with trees, it is best to clear it by hand; for when it is killed with drowning the land, the trees are extremely hard to cut, so doth but delay the time and increase the charge.

I am told by a credible person that tried it, that the best way is to draw off the water at the beginning of the dog days; the mud will be so heated with the sun, that in this method the swamp will be more killed in one year, than it will be in two years when the water is kept up all the time; and it stands with reason it should do so; for it is the heat and scalding of the water or mud which doth the business.

I have observed, that where the water stands deep, and consequently keeps cool, the bushes and trees are the longer before they die.

But, however, as this is not backed with much experience, every one must act his own judgment.

Since the drained lands are so valuable, we should extend that improvement as far as we can.

I have observed in many fields there are small swamps or frog-ponds, which have a good deep soil, and are very rich, and would be profitable could they be drained. But they lie low, and are so compassed on all sides with high land, that it is impossible to drain them in the ordinary way.—

These swamp or frog ponds, contain a quarter of an acre, some half an acre, and some two or three acres. Let them be great or small, they are worth bringing too, if possible, at a reasonable expense.

If they can be drained, and recovered at all, it may be done in a way that is easy and cheap.

1. In the first place, clear off all the bushes and let the sun fall upon it; and this alone will do more than most men believe, especially if it be not fed with springs.

If the sun did not draw off abundance of water why do not the Mediterranean and Caspian Seas drown all the country round, when there are so many great rivers continually discharging themselves into those Seas, where there is no outlet?

2. Look round on all sides, and if on some side of the swamp there be not some river or low ground which is lower than the bottom of a frog pond, which you desire to drain. On that side near the edge of the pond, dig a hole so deep till you come to a stratum or layer of gravel, or coarse sand, then stop, and by a ditch let the water out of the pond or swamp into the hole; and observe if in the space of three days the water begins to soak away, you may expect by this means to drain your land; this subterraneous passage in time will draw away the water.

But in order to succeed, you will find in a few days there will be a fine sediment, thin like a cobweb in the bottom of the hole, which will entirely stop the passage of the water; but this film is easily broken by stirring up the bottom with a hoe.

When you have drawn off the water so that you can plough the ground, that will effectually break up a pan bottom, so that the water will soak away, and the land be useful and profitable for the time to come.

As the bushes that grow in these frog ponds are button-wood, for the most part, it is difficult to subdue them any other way but ploughing.

This way of subterraneous draining is more uncertain than when you have a visible outlet drain, yet the trial may be with a little charge.

I have known sundry such pieces of land drained the common way, that have been so good, that in a short time they have paid all the charge expended upon them, and would look as though they never had been what they really once were.

It is a common thing in swamps to find the moss two or three feet deep: at first I was a great deal concerned about it, how I should get rid of it; as also whether the land would be of any worth if the moss was removed; as is said, can the rush grow up without mire? can the flag grow without water? so I found when the water was drawn off by ditches, the moss grew so dry, that in a hot dry season in the summer, it would burn quite down to the ground; but to burn that, or any other trash that you would consume, set fire to it when the weather is clear, the sun hot, and a strong southerly wind, which makes fire rage more fiercely, and do much more execution than a northerly or westerly wind: in a northerly wind the air is thin and light, so that the fire is not strongly compressed; the moist, heavy south wind prevents the dissipation of the fire and renders it more compact.

We see a smith will swab and wet his coals, by which means the heat is greatly increased. Now whether the reasoning be just or not, the fact is certain, which is the chief concern of the farmer.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 3, 1828.

FINE ISABELLA GRAPES.

We have received a very acceptable present of fine large clusters of the Isabella grape, raised by ZEBEDEE COOK, JR. Esq. of Dorchester, an excellent Amateur Horticulturist, who evinces much skill and judgment as a cultivator. The finest of the specimens referred to, were (we understand) increased to their extraordinary size, by ringing, or decortivating the branches on which they grew, as has been occasionally recommended in the N. E. Farmer.

The Editor of London's Gardener's Magazine, [London] acknowledges the receipt of an article from JESSE BUEL, Esq. of Albany, containing a description of all the principal nurseries of America, which is to appear in the next number of that magazine.

Bees.—The October number of the North American Review contains a valuable article on the management of bees; the substance of which we shall give in the N. E. Farmer.

WM. FURNESS, Esq. has left at the N. E. Farmer's office, two Baldwin Apples, weighing 25 ounces—the largest measuring 12 inches in circumference, the produce of a very small tree on his place at Medford.

A PROFITABLE TREE.

MR. SAMUEL R. JOHNSON, of Charlestown, informs us that he has this year received the sum of \$49.29 for the produce of a single Plum tree, of the *White Gage* species. The tree is but six years old.

ESSEX CATTLE SHOW.

The Annual Cattle Show, and Exhibition of Manufactures, of the *Essex Agricultural Society*, was held at West Newbury, on the 24th ult.—The number of animals was less than in some former years, but the exhibitions of Manufactures are highly commended. The Ploughing Match was the best ever witnessed in the county.

Among the manufactures were shell combs, in imitation of the Canton combs, exhibited by Messrs. Bailey & Williams, of West Newbury; a specimen of American Silk, by Mr. Boynton, of West Newbury; a Lace Veil and Handkerchief, by Miss Coffin, of Newburyport; a specimen of Mustard from American seed, by Mr. John P. Webber, of Beverly. Mr. Otis Little exhibited 760 Long Red Potatoes, measuring 4 bushels, and weighing 246 pounds, produced from a single potato.

The Ploughing Match was very well and ably contested. There were fifteen teams engaged in it. A quarter of an acre was ploughed by each, and no one exceeded 75 minutes in performing the work. The premiums were gained by Perley Tapley, of Danvers, for 1st double and 1st single teams; Jesse Putnam, 2d. Abel Chase, Jr. 3d. and Daniel Moulton, 4th double teams. Jesse Putnam and Daniel Putnam divided equally the 2d. and 3d premiums for single teams, and Abraham Dow of West Newbury, the 4th do. William J. Greive, of West Newbury, received a gratuity for ploughing with horses.

We learn that the reports of the several Committees will be published in a pamphlet together

with an able and interesting address from Col. PICKERING, President of the Society.

THE MOST HEALTHY FUEL.

The following remarks on the comparative salubrity of different species of fuel, are from an anonymous English writer. They appear to us to be valuable:

As a comparison of the salubrity resulting from the use of different species of fuel, or rather that of the degree in which they respectively vitiate the air for respiration, the statement may be taken as a near approximation thus:—coke or coal, which contains much sulphur and little bitumen, (as the Kilkenny and Welch coal or culm) is most highly noxious to animal life; owing to the want of sufficient hydrogen to carry off the sulphur and carbon by means of the chimney flue. The sulphureous and carbonic acid gases from their considerable gravity, descending into the lower part of a room will very seriously deprave the atmosphere for the purposes of animal respiration.

Coal of the ordinary kinds follows next in vitiating the air of a room. These varieties being most noxious, which give out the greatest quantity of sulphur, and but little carburetted hydrogen. A blazing or "free burning coal," as it is usually called, being more salubrious, especially for private or close apartments, than the more durable varieties; on account of the hydrogen or gas flame producing a better current up the chimney, than would result from a mass of ignited fuel without flame.

Peat or turf though forming but a small proportion of the fuel used in England, constitutes the major part of the fuel used in Ireland and part of Scotland. This class of fuel, (which may be termed coal in its incipient stage of condensation) is found in different districts in such various stages of compression or solidity, as to render any general statement with regard to its density very imperfect. Peat or turf cut from the mountain or upland bogs in Ireland, possesses a degree of solidity nearly approaching to that of coal; and a specific gravity a little exceeding that of water. Other specimens of more recent formation, and especially that cut from those vast tracts of bog land called "live bog," (which produces a deposit or stratum of turf annually, by the growth and subsequent decay of a spongy mass of vegetable fibre) is of so porous and light a texture as to be scarcely worth the expense of cutting. The best kinds of turf yield a brilliant white flame; and in point of durability it may be said to be intermediate between coal and wood, when used as fuel. There is however a peculiar acrid vapor from the very best specimens of turf (probably from the ammonia and sulphur), which renders this fuel highly disagreeable to many persons unaccustomed to its use. And wherever good coal can be obtained at a moderate price, the latter is not only more durable and convenient fuel than turf, but it is probably less noxious to animal life than the vapor produced by the combustion of even the very best kind of turf.

Charcoal employed as fuel in open fire-places, is highly deleterious to respiration. For although it is free from the nuisance occasioned by visible smoke, and therefore convenient as a detached fire on some occasions, (such as the drying of rooms after undergoing repair) yet it should never be employed for domestic fires, unless a strong current of air can be allowed to sweep through

the apartment, in order to drive off the carbonic acid gas evolved. The density of this gas being one half greater than that of atmospheric air (or as 1520 : 1000) it will disperse itself in the lower parts of the room, instead of passing up the chimney shaft, if charcoal be used in an ordinary sitting room, where a current of air cannot be permitted. In certain processes in the arts, charcoal fires are almost indispensable; but they ought never to be employed without the means of readily carrying off the carbonic acid by ventilation.

Wood, when employed as fuel, is less injurious to the atmosphere than either of the preceding substances. The best varieties of English wood for producing a brilliant and quick fire are ash, hazel, hornbeam, &c.; but oak and beech are the most durable. The quantity of light carburetted hydrogen given out during combustion, not only contributes to that cheerful flame or blaze peculiar to wood fires, but as we before stated, its levity causes it to ascend the chimney-flue with rapidity, at the same time producing a current of heated air, which draws after it the vitiated air of the apartment in conjunction with the carbonic acid formed by the combustion. It is almost superfluous to remark, that, after the gaseous product, or flame of the wood becomes exhausted, the current, or draft of the chimney becomes proportionably diminished. And although the live embers of charcoal will retain a state of ignition even until they become entirely reduced to ashes, yet it is injurious to health for a person to sit immediately over such embers, from the quantity of carbonic acid gas evolved by the charcoal.

It appears, therefore, that wood, employed for the purpose of domestic fuel, not only affords a more cheerful fire than charcoal, coal, coke, or peat; but that, when properly managed, it vitiates the air of an apartment in a much less degree, both from the product of combustion consisting of less deleterious matter, and from its greater levity, producing a strong current of air through the chimney, and thereby effectually ventilating the room.

The combustion of any kind of light brush or faggot wood, in the grate of a room which is greatly confined, or which is suspected to contain a vitiated atmosphere, affords one of the most ready and effectual means of ventilation; and should always be employed after an apartment has been shut up the preceding night with live coke or charcoal in the fire-place.* The effect of carbonic acid and sulphureous acid, though insidious in its approaches, is so highly injurious to animal life, and more especially to invalids, that precautions of this kind in our dwelling houses, where the doors and windows are made almost air tight, ought never to be forgotten by those who have the charge of such apartments.

* From some recent experiments of Dr. Murray on the antiposonous agency of acetic acid taken internally, we might infer that this acid in a state of vapor, which is given out copiously during the combustion of green wood would also have a salutary agency in correcting moisture in a confined room.

Prevention of colds.—"Perhaps," says Dr. Beddoes, "there would be hardly such a thing as a bad cold, if people, when they find it coming on, were to keep cool, to avoid wine and strong drinks, and to confine themselves for a short time to a simple diet, as potatoes and other vegetables, with toast and water. I have known instances of heat in the nostrils, difficulty of breathing, with a short tickling cough, and other symptoms, threat-

[illegible]

MISCELLANIES.

From the New England Farmer's Almanack for 1829.

By THOMAS G. FESSENDEN.

OCTOBER.

The summer flowers are faded,
The fate of beauty sharing;
And nature, somewhat jaded,
Seems overdone with bearing.

But fruit those flowers succeeding,
The orchard'st reaping,
Abundant as in Eden,
Is scarcely less inviting.

A second crop of grass is
Now toying with the zephyrs,
By which the hind amasses
Sweet food for cows and heifers.

The fields of corn are studded,
With ears of golden glewing,
And all the land is flooded
With bounties overflowing.

O then the tribute render
To the Almighty Giver,
Of all the heart can tender,
And all the tongue deliver.

Loss of pumpkins.—Very great losses have been sustained by the farmers on Connecticut river, in the article of pumpkins, which were swept away by the late flood into Long Island Sound, and from thence out to sea. We understand they were not insured—and furthermore, that serious apprehensions are entertained lest there should be no thanksgiving for the want of pumpkin pies. We hope, however, it is not so bad. —*Berk. Am.*

The importance of woman.—She gives birth to the species, and adorns its creation by its fruits. The first sensation of rapture experienced by man, is while inhaling nourishment from the breast of woman. The first desire of permanent happiness, is to embrace woman. The first enjoyment of life is on the breast of woman. The last sigh of expiring virtue, is drawn on the breast of woman. It is the voice of woman that cheers his drooping soul with hope. It is the song of woman, that onkindles in his heart the cause of rapture. It is the tear of woman, that assuages his sorrows. It is the sigh of woman, that maddens him with the delirium of love. It is the hand of woman, that gives him the ease and comforts of home; and smooths the pillow that launches him into the tomb of his fathers.

Singing cocks.—The Editor of the American Farmer has received from Mr. Wright, (the acting consul at Rio Janeiro) two barn-door fowls, of the species called by the Portuguese "*Canta galla*," or singing cock. Its name is derived from one of its faculties. It spins out its crow, in a new style of singing, like fine ladies who drawl and lengthen out their chromatics, till one begins to fear that she will spin out all the breath in her body, not leaving enough to recover upon. —*Bos. Courier.*

Drunkenness.—What degradation and sin for any virtuous woman to marry a drunkard! "If a drunken man," quoth old Burton, in his *Anatomy of Melancholy*, "gets a child, it will never likely have a good brain."—"It is remarkable," says Darwin, "that all the diseases from drinking spirituous or fermented liquors, are liable to become hereditary, even to the third and fourth genera-

tion, gradually increasing, if the cause is continued, till the family becomes extinct."

Only think of a drunken bridegroom!—a beast that swills during the honey-moon!—snoring insensible by the side of a sweet, delicate, loving, aye, even loving creature yet in her teens! An old, useless, barren bachelor may drink till he dies—little harm can he do to any body but himself, though, to be sure he may sorely distress his old maiden sister and house-keeper Shoozy—and break the affectionate and faithful creature's heart. But a married man, a father of sons and daughters, all smiling, or willing to smile, round his board, to be a drunkard! He deserves that death should come stealthily in, once a month, like an unseen tiger at midnight, and carry them all off, one by one, to his den, the grave. For Nature will not endure to see her holy gifts so profaned; sooner or later, she will show herself revenger and avenger: and the drunkard will be forced to feel like a very man at last, when his little Benjamin, the sole survivor of all the many, whose mother died that he might be born, is buried with the rest; and the broken-hearted wretch's town house and country house, each with four stories above ground, besides two sunken ones, and commodious garrets, have emptied themselves, dining room, drawing room, parlors, libraries, and bed rooms, into the church-yard! —*Blackwood's Mag.*

The military muster which was held in this place last week, afforded our citizens a favorable opportunity for witnessing some of the effects of the present militia system. With regard to the appearances of the troops, as we are no critics in such matters, we have nothing to say—but the scenes of vice, intemperance and general licentiousness so prevalent on the occasion, deserve a brief notice. We do not recollect a more disgusting exhibition at any time than was witnessed in our streets on the day of the muster. On each side of the upper part of Main-street, where the troops were organized, and also adjoining the field where they were reviewed, scores of tables and booths were to be seen, furnished with every kind of ardent spirits, to tempt the appetites of the surrounding multitude. Within a short distance on Main-street only, a gentleman informs us he counted upwards of forty of these establishments, where intoxicating liquors were dealt out to the noisy crowds who clustered around them. As might be expected, instances of intoxication, gross profanity, gambling, fighting, and disorder were not unrequent. The whole scene was highly disgraceful to our city, and calculated to pain and disgust every friend to good order and good morals: and this was probably a fair specimen of the accompanying exhibitions of almost every regimental muster. Now for what object, we would ask, are the morals of the community periodically exposed to the corrupting influence of such scenes? Surely there ought to be some important benefit to compensate for so great and serious an evil. We are aware the best institutions may be necessarily attended with evils, which, though to be regretted, must be endured on account of the greater benefits by which they are overbalanced. But how stands the case with regard to militia musters? What in the opinion of men of military skill and experience are the advantages resulting from them? Just none at all.

The whole is a mere farce—a useless parade, unattended with any important improvement in the discipline of the troops. The expense of time

and money, to which a portion of citizens least able to bear it are subjected, is immense—the extent of injury inflicted on public morals alarming. If, instead of the present burdensome and unequal system of trainings, all citizens liable to do military duty, were to be enrolled and required to equip themselves, and once a year, on the same day throughout the State, were called out by companies for inspection, would our militia be less efficient than at present? And if, in addition to this, provision were made for the instruction and discipline of the officers, does any one doubt the result would be a great improvement on the existing system? Why then should this system, with its train of evils, be retained? The subject is worthy of serious consideration—it is worthy the attention of philanthropists—and in the great efforts making at the present day for the suppression of vice, and the promotion of virtue and good morals, we hope it will not be overlooked. Where is there a more prolific source of immorality and vice than militia musters? On what other occasion do we meet with more painful and disgusting scenes of intoxication, profanity, and vulgarity? It is certainly a matter of congratulation that these musters are not permitted to take place oftener than once in two years; and we cannot but hope that another legislature will see the expediency and importance of rendering them still less frequent, if not entirely abolishing them. —*Connecticut Courant.*

Splendid Bulbous Roots.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, direct from Van Eeden & Co. Harlem, Holland, a large assortment of Bulbous Flower Roots, comprising the finest varieties of

HYACINTHS—(double and single,) dark blue, porcelain blue, red and rosy coloured, pure white, white with yellow eye, white with rosy eye, and yellow with various eyes; from 25 cts to \$1.00 each.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots 33 cts. each.

JONQUILLES—sweet scented, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 33 cts. each.

DOUBLE NARCISSUS—fragrant, of all colors, 19 cts. each.

SPRING CRICUS—of all colours, 6 cts. each, 50 cts. per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 3 1/2 inches in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the mere refuse of the most inferior collectors, good roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

A further supply of Lilies, Persian Fritellaries, Iris, Ixias, Peonies, Anemones, Star of Bethlehem, &c. is daily expected. All orders faithfully executed.

Hemp Seed.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, A consignment from Troy, N-Y. of 50 bushels of Hemp Seed, growth of 1827; by the tierce or bushel.

Oat Meal, Oat Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine bolted Oat Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few canisters of fine Oat Flour, neatly packed, at 50 cts. per canister.

Spring Wheat.

Just received a few bushels of prime Gilman Spring Wheat, growth of 1828, raised in Southborough, M.

Published every Friday, at \$3 per annum, payable at the end of the year—for those who pay within sixty days from the time of advertising, no charge for a probation of fifty cents.

NEW ENGLAND FARMER.

TWO SORTS OF PEARS NATURALLY PRODUCED ON THE SAME TREE.

MR. FESSENDEN—I send by the bearer, two pears taken from a seedling tree, planted here, about thirty years ago, and which has never been grafted or inoculated. The seed was taken of a St Germain pear, and was planted by the present proprietor in the garden where it grows. You will notice that the two pears are unlike in size, shape and appearance, one being of a russet colour, the other of a light green. The largest is now in eating, and is more than twice the size of the russet coloured fruit, which will not ripen for some weeks; and is then totally dissimilar in flavor from the others. They are evidently two distinct kinds of pears, growing on the same tree, and, what is still more curious, they grow together all over the tree, even from the same bunch or tufts of blossoms. This has been the case ever since the tree commenced to bear, with the exception, as the owner informs me, of the first year.

If you think the preceding article, from the singularity of the fruit, worthy an insertion in the *Farmer*, please make use of it for that purpose.—The tree stands in the garden of Mrs Williams, of this place. Respectfully your obt. serv't.

Salem, Sept. 29, 1828. STEPHEN WHITE.

Remarks by the Editor.—The above-mentioned curious productions may be seen at the office of the *New England Farmer*. The manner in which they grow, intermixed with each other in every part of the tree, seems to be at variance with the commonly received theories of vegetation, which maintain in substance, that the shape or peculiar formation of the cells or sap-vessels in the branches, give the character, flavor, &c. to the fruit.—But facts are of more importance than the most plausible theories, and when facts and theories

are absolutely irreconcilable, the latter must of course be rejected.

QUERIES.

MR. FESSENDEN.—An answer to the following questions in the *New England Farmer* would be gratefully received by at least one of your subscribers: When it becomes necessary to remove apple trees from the ground on which they stand being thrifty and in a bearing state, which are from three to eight inches diameter, can they be transplanted with a prospect of success? And if they can, what is the best method, and what is the best time in the year for transplanting?

October 8th, 1828.

A. B.

(Abstracted from London's Gardener's Magazine.)

GARDENS ABOUT LONDON.

From Kensington through Hammersmith, Chiswick, Brentford, Isleworth, and Twickenham, seven miles of garden ground, may be denominated the great London fruit garden north of the Thames. An upper and under crop taken at the same time; the upper the fruits on trees; the under, strawberries and various herbaceous crops.—To increase shelter and warmth in autumn, they raise banks of soil five feet high, facing the south and sloped to an angle of 45°; on these they plant endive in September, and near the bottom, from October to Christmas, they drill a row of pease; the endive is preserved from rotting, and the pease come in maturity nearly as early as if under a wall. The springs here lie eight or ten feet under the surface, and the water is raised from the wells by a bucket and lever balanced by a stone. Three thousand acres of ground here, employing five persons, a man, his wife and three children, per acre, during the winter half year, and during summer, five persons more, chiefly Welch women. Estimated produce £100 per acre.

KITCHEN GARDENS.

Much fresh littersy dung required for growing mushrooms, early cucumbers, salads, potatoes, asparagus, &c. Consumption of the metropolis and its environs, for fruits and vegetables estimated at upwards of a million sterling pounds per annum. Several farming gardens pay £1000 per annum.

STOCK ON FARMS NEAR LONDON.

Less live stock on the farms in Middlesex than in any other; no breeding of cattle. Short horned cows of Holderness chiefly owned by milkmen; number kept 8500; average produce nine quarts per day; fed on hay, turnips, linseed cake and jelly, brewer's grains and grass; retail dealers adulterate the milk; preferring dirty water to clean; and adulterate the cream by adding molasses and a little salt. Very little butter made in the country. Brewers' drays supplied with horses from the Berkshire farmer, who buy them young from the Northamptonshire farmers, and work them two or three years before they sell them.—Not more than one dove house in the county; but many pigeons kept in empty wine pipes set upon posts, fifteen or twenty feet high, and many kept by journeyman tradesmen, pigeon fanciers in the

RURAL ECONOMY ABOUT LONDON.

Half the manual labor done by the job; laborers ruined in morals and constitution by the public houses. Gentlemen's servants a bad and contaminating set.

A RECEIPT FOR PREPARING MOLASSES FOR PRESERVING FRUITS.

Take 8 lbs. molasses, bright New Orleans or Sugar House, 8 lbs. pure water and 1 lb. coarsely powdered charcoal. Boil them together for 20 minutes, then strain through fine flannel, double; put it again in the kettle with the white of an egg, boil it gently, till it forms a syrup of proper consistence, then strain it again.

NEW VARIETIES OF FRUIT FROM MR BUEL.

Jesse Buel, Esq. of Albany, has sent to Mr London, conductor of the *English Gardener's Magazine* the following scions for grafting: "The Jonathan Apple, a medium sized winter fruit, resembling Esopus Spitzenberg, though I think preferable for the table, the flesh being more tender, less acid, and equally high flavored. The Mouse Apple. An earlier winter apple, flesh lustrous, juicy, and peculiarly pleasant; colour yellow; size above medium.—The Poughkeepsie Russet Apple. Believed to be very superior for cider, the juice amounting in saccharine matter, and syrup.—The process of fermentation in a cool temperature is very slow, and continues for a long time before this liquor becomes clear.—The Powan, Spitzenberg Apple. Named from its native place, and from its resemblance to the Esopus Spitzenberg. It is a very superior winter fruit. The Strain (correct) Apple. So named from the place where the present tree grew. It is an autumn fruit, and according to my taste inferior to no fruit of the season; tender, juicy and well flavored.—The Beauty of the West Apple. A large showy winter fruit, and of pretty good flavor.—The Cos Apple. A good keeping winter fruit; juicy, mildly acid, and well flavored; the skin striped with dull red and green, and of a large size; the surface more oily to the hand than any other apple I have ever seen.—The Blucher's Gage Plum. Named after the clergyman who first raised it from a delicate fruit received from Germany. It has a high reputation here, where plums grow in as great perfection as in any part of our country. Colour yellow; size pretty large.

These fruits have all of them an American origin, are most of them new varieties, and are but partially known to our nursery men. Since making up the packet, I observe that the Strain, and that only, is in the collection of the Horticultural Society.—*J. Buel, Albany Nursery.*

Our best thanks and wishes attend Mr Buel for these cuttings, and for another communication, which shall appear in a future page. The cuttings are grafted and doing well, and we shall dispose of the shoots produced among our friends as scions.—*Cond. of the Gardener's Magazine.*

POTATOS.

The Right Hon. Sir John Sinclair has lately published a work "On the Culture and Use of Po-

tatos, which is thus taken notice of in the Scotsman.

This is an abstract of nearly all that is known respecting the use and culture of potatoes. Potatoes were brought to England about 1586, but their culture spread very slowly for a long period afterwards. They were first planted in the open fields in Scotland so late as 1728. There are a great variety of species, some of which yield about twice as much as others on the same ground, and with the same culture. The produce in England varies from 136 to 830 bushels per acre, the average being about 360 bushels, or 12 tons. Including Scotland, however, Sir John estimates the average at 216 bushels, or 7 tons. Where families live entirely on potatoes, it is calculated that a man, his wife, and four children, will consume about a ton each, or 6 tons altogether; but where milk is used, according to Dr Skene Keith's estimate, about half the quantity will suffice; so that among a population living in the Irish cottier's mode, an acre would supply solid food for 14 persons. A pound of oatmeal is reckoned to afford as much nourishment as 6 lbs., and a pound of wheaten bread as much as 5 lbs. of potatoes. The potato, as analysed by Dr Pearson, consists of 70 parts of water and 30 of meal. The meal is composed of starch, or fecula, 16; leafy or fibrous matter, $8\frac{1}{2}$; extract or soluble mucilage $5\frac{1}{2}$; total 30.

ENTOMOLOGY.

As a science has not till of late years been properly appreciated. At the time when "The Rambler" by Dr Johnson, was published in Great Britain, the pursuit was considered as a legitimate subject of ridicule; and the man who spent his time and money in collecting insects, and investigating their habits, propensities, and uses, was considered as a madman, harmless perhaps, but decidedly insane. Even now, in the minds of many, the learned as well as the vulgar, the idea of the trifling nature of his pursuit is so strongly associated with that of the diminutive size of its objects, that an *entomologist* is synonymous with every thing futile and childish.

Mankind, however, are beginning to realize the fact, that insects, though petty, are powerful—though minute are mighty—that much of the good and evil which we enjoy and suffer is the work of their tiny but countless tribes. Some kinds of insects are the instruments of famine, and the precursors of pestilence, other kinds are friendly to man, and supply him with useful, precious, and splendid commodities. "The study of insects must be important. For when we suffer from them, if we do not know the cause, how are we to apply a remedy that may diminish or prevent their ravages? Ignorance in this respect often occasions us to mistake our enemies for our friends, and our friends for our enemies; so that when we think to do good we do harm,—destroying the innocent and letting the guilty escape."

Impressed with these ideas, we are happy to inform our readers that Dr HARRIS, (who is well known as the most able entomologist in New England) has consented to furnish for the *New England Farmer* occasional essays on the subject of insects. We consider ourselves as under great obligations to that gentleman for making this journal the channel for communicating the results of his researches to Cultivators who are more immediately interested in the objects of his investigations than any other class in the community.—EDITOR N. E. FARMER.

CONTRIBUTIONS TO ENTOMOLOGY.

BY THIADDEUS WILLIAM HARRIS, M.D.

An interest in the science of entomology appears to be awakened among us, and we are gradually becoming sensible of the utility of the pursuit. To mention nothing more, the frequent inquiries, made in public journals, respecting the economy and metamorphoses of insects, sufficiently indicate a desire for further information.—There may be some who object to the study of in-

sects on account of their apparent unimportance and insignificance. These may be assured that it is a never failing source of the most rational enjoyment; and that there is as much to be discovered and to astonish in magnifying an insect as a star. The powerful influence which insects are permitted to exert over our interest, compel us to notice them; and their wonderful structure, metamorphoses, and habits display the wisdom and protecting power of their Creator.

Hitherto our insects have been better known to naturalists across the Atlantic, than to ourselves. We have been too busy, too idle, or too ignorant to give the public an account of these numerous inhabitants of this new world. With here and there a solitary exception, Mr Say is the only American naturalist who has made known to us any of these curious objects. In the following contributions will be described some of those which are to be found in this vicinity; a part of them are supposed to be new, and others not fully investigated. It is thought that this may be of some service to those who are commencing the study of entomology, and may stimulate them to pursue this interesting branch of natural history, and to seize every opportunity of recording the facts, which may come to their knowledge, respecting the insects they investigate. If, hereafter, it shall be shown that any of them were previously known, it will give us pleasure to acknowledge it, when duly informed. It certainly cannot be a cause for reproval that among the many rare, expensive, or inaccessible European works on Entomology, or in the very brief and unessential description of others, the characters of some of these supposed new species may be detected. The number of known plants in the United States, according to Mr Nuttall, is about 5000: Mr Kirby states that insects are to plants as 6 to 1; according to this ratio the number of our insects must amount to 30,000. Mr Say has described about 1200 new species, and perhaps 3 or 4 thousand may be known to Europeans: still a vast number must remain unnoticed. Shall those, then, who have studied the characters and investigated the habits of these insects in their native wilds, delay publishing the fruits of their labors because they may possibly, now and then, add a new synonym to nomenclature? The following appropriate quotation may well close these preliminary remarks. "This procrastination on our part, in most cases, springs from a laudable though erroneous motive. We aim at a point of perfection never to be attained. Year after year we keep back that knowledge we have already acquired, in the hopes of rendering it more perfect. New discoveries arise, yet we wait for more. Meantime the stream of life is slowly passing from us; we find those discoveries on which we had built our future fame, anticipated by contemporaries. Forcibly impressed with this conviction, I shall make no apology on this, or any future occasion for laying before the readers of this journal detached descriptions or isolated remarks on such new objects as may come before me; imperfect as these observations may be, they may stimulate the inquiries of others; and, at all events, secure to this country, in some measure, the credit of making known the natural productions of her own possessions."

For the characters of the families and genera, Sanouelle's "Useful Compendium,"—the article "Entomology" in Brewster's Encyclopedia, or the

3d volume of Cuvier's "Regne Animal," may be consulted.

ORDER COLEOPTERA.

Family Cicindelida.

GENUS CICINDELA.

The insects of this genus frequent dry and sandy places, and some species are very common in our highways. They fly swiftly, and frequently alight at a short distance from their starting point. They are rapacious and devour such small insects as they can seize. There may often be observed small round holes in the ground frequented by Cicindelids; these are the habitations of the larva.—By passing down a straw as a director, and carefully removing the earth, we can obtain the larva. It has a soft, cylindrical, whitish body, with corneous, purple or green head, thorax and jaws. There are 6 legs near the head, an anal proleg, and a pair of tubercles surmounted with hooks on the eighth segment. When in ambush it remains near the surface, the head closes the hole, and thus conceals the pit and its sanguinary inhabitant from those incautious insects which may be passing over it. These are seized in a moment and conveyed to the bottom of the retreat, to be devoured at leisure. The tubercles and hooks assist the insect in its frequent motions up and down, and the large concave surface of the head serves as a basket to hold the earth which it excavates in fabricating its burrow. The mouth of this is carefully closed with earth when the larva has attained its growth; it then becomes a pupa, and after some time emerges in its perfect state. The Rev. L. W. Leonard, of Dublin, N. H. kept one of these larva in a vessel of earth, and fed it daily with small insects, till it underwent its metamorphosis. There appear to be two broods in the year, one makes its appearance in August and September, and the other in the following April and May, having remained pupa during the winter.

C. denticulata. Brilliant polished green; mandibles elongated, slender; each elytron with 3 unequal marginal spots and terminal bunch white.

Length near half an inch.

Head green, blueish and longitudinally corrugated and in the male with long white hairs between the eyes; four basal joints of the antennae brassy green, remaining ones piceous; labrum tridentate, with 6 marginal punctures, of the male white edged with blackish brown, of the female entirely greenish black; mandibles very long, slightly arcuated, slender, greenish black, above with a linear, basal white spot; palpi brassy green in the male, greenish black in the female; eyes brown. Elytra brilliant ferruginous green, in certain positions blue or purple, with very minute distant punctures, a series of deep punctures with elevated centres near the suture, an abbreviated series of similar punctures near the pumeral angle, and a few scattered ones around the scutell; external margin with three white spots, one of which near the middle of the margin is large and triangular, the apex of the triangle pointing to the suture; one very small and rounded between the former and base of the elytron; and the third or posterior one elongated longitudinally into an oblong oval shape, not quite attaining the margin, and confluent behind the terminal lunule. Pectus, postpectus, and thighs green, with white decumbent hairs.

Variety *a*. Elytra purplish blue.

b. Anterior spot of the elytron wanting.

c. Anterior spot wanting, triangular one

reduced to a transverse line, posterior one small, not reaching the terminal lunule.

d. Two anterior spots obsolete.

e. All the spots wanting except the terminal lunule, which is merely an abbreviated transverse line.

f. Elytra immaculate.

This species is evidently distinct from the very common *C. serguttata*; a single glance at them when compared together will convince any one of their specific difference. The long slender mandibles of the *denticulata* are remarkable, those of the *guttata* being one third shorter, more robust, and more curved. The latter species has no hairs between the eyes, nor beneath the pectus and postpectus, the elytra appear rough from the deep confluent punctures with which its surface is impressed, and it is destitute of the remarkable humeral and subsutural series of deep punctures. The shape and disposition of the white spots are different in the two species, the *denticulata* never having the *supernumerary* discal spot observable in a variety of the *serguttata*.

This fine species was captured on the sands near Sweet Auburn in Cambridge, in company with Mr. Say's splendid *C. formosa*. It was sent, with the next species, to Prof. Hentz, who has adopted the specific names here given in a paper read before the Academy of Natural Sciences of Philadelphia. His descriptions have not yet met my eye.

C. hamorrhoidalis. Brownish obscure; elytra with a humeral and terminal lunule, an intermediate sigmoid band, and two dots behind the band white; postpectus and thighs green, ventral segments sanguineous.

Length nearly half an inch.

Antennae green at base; head cupreous, with two green abbreviated lines between the eyes;—mandibles white at base, black at the points; lips white, with a single tooth. Thorax cupreous, obscure, with the margin and breast green. Elytra obscure, somewhat cupreous; a humeral lunule apparently formed of two spots connected by a curved line, on the middle of the elytron a flexuous or s-shaped band, behind this a marginal spot, and near the middle of the tip another larger spot almost touching the anterior portion of the terminal lunule. Pectus and postpectus green, the latter with white decumbent hairs at the sides; ventral segments sanguineous. Thighs green, feet obscure.

This pretty species is found in dry paths in woods; but does not appear to be common. From what was observed under the preceding species it will be seen that these two must be called *C. denticulata*, and *hamorrhoidalis*, Hentz.

The other insects of this genus, found in this vicinity, are *C. vulgaris*, Say; *C. purpurea*, Olivier; *C. hirticollis*, Say; *C. formosa*, Say; *C. serguttata*, Fabricius; and *C. punctatula*, Fabricius.

INSECTS.

This summer, says the Philadelphia Aurora, has been remarkable, in various parts of the country, for the immense number of insects produced.—First came the caterpillars, in immense swarms, devouring every green thing within their reach.—These were followed by ants and mosquitoes, which to the present time infest some districts of this city to a most annoying extent.

A FEW FACTS.

During a late visit to New England, we were much delighted with what we saw and heard indicative of a reformation on the subject of intemperance. In riding 260 miles by stage, we did not see one driver, nor one passenger, who seemed addicted to this vice. The general call was, at the various stopping-places, for "a glass of lemonade,"—"a glass of spruce beer,"—"a glass of water," &c. while rum, with its kindred poisons, appeared to be almost forgotten.

On one occasion, at dinner at a public house, we had the curiosity to notice (unnoticed) how many of the company were brandy-drinkers; and the result was, "but out of eight persons at table, who were brought together by mere accident, not one tasted of ardent spirits, although provided in abundance. On various other occasions, indeed we may say universally, there was a very manifest improvement in favour of temperance since we last visited New England; and this was evinced, not only by a change of practice, but by an awakened feeling and prompt expression, whenever the subject was mentioned.—N. Y. Observer.

SINGULAR DISCOVERY.

Mr. Horton, a gentleman who has been engaged in boring for water in Providence, has presented to the public some very remarkable results.—In his second experiment in boring, he selected the extreme point of a wharf, many yards from the original land. He bored through the artificial soil, then through a stratum of mud, then through bog meadow, containing good peat, then through sand, pebbles, and quartz gravel. At this point water, impregnated with copperas and arsenick, broke forth; but, determining to proceed farther, Mr. Horton next struck a vineyard and drew up vines, grapes, grape seeds, leaves, acorns, hazelnuts, pine burs and the seeds of unknown fruits, together with pure water. This was thirty-five feet below the bed of the river!—Palladium.

GOLD MINES.

In another column of this paper will be found a highly interesting and valuable communication, on the subject of the Gold Mines of the United States, which are much richer and more extensive than we had supposed. Our scientific and intelligent correspondent, who is a resident at the South, derives his minute knowledge of facts from personal observation.

It is a matter of sincere congratulation, that in proportion as Natural Science extends, the resources of our country are found to be more abundant. Its mineral treasures have as yet been but imperfectly explored. We fully concur in the suggestion of our correspondent, that the mines of the southern states present stronger attractions to our enterprising citizens, than do those of Mexico and South America.—N. Y. Statesman.

Cultivated products for the London market.—London affirms that in the county of Surry, England, the following are objects of field cultivation: Peppermint, lavender, wormwood, camomile, liquorice and poppy, grown near Mitcham; and more extensively than in any other county. One hundred acres of peppermint, elecampane, rhubarb, soapwort, coltsfoot, vervain, angelica, rosemary, the damask and red roses, hyssop, horehound, marsh-mallow, pennyroyal and several acres of daisies, wall-flowers, sweet Williams, primroses, violets,

pink, bachelor's buttons, and the like, are also grown for Covent Garden market, where they are carried, either as entire plants in flower, with balls for planting in town, flower-pots or in pots, or the flowers are sold and gathered for nosegays. Weld is grown in a few places.

Let every farmer divide his pasture ground as he pleases. Let the fence between his arable and pasture land, be as strong as an external fence.—But, if possible, let all his arable ground, though it be a hundred acres, be in one lot. Then his plough runs clear, in a long furrow. His tillage is divided only by the different species of grain and vegetables, he cultivates. There are no fences; in consequence no inconvenient and worthless headland; no apology for thistles and nettles. The scene is beautiful to the eye. The whole has the appearance of a garden; and he gets in the farmer a sort of horticultural neatness.

At the late show of Manufactures at West Newbury, there was an exhibition of peculiar and very novel interest by Mr. Enoch Boynton, of Newbury, who produced specimens of Silk of his own manufacture, together with the substance of the material in the various stages of its growth and preparation. Mr. Boynton, who has been indefatigable in his present undertaking, states that he is now rearing 1000 mulberry trees, which are just coming forward, and expresses the most entire confidence in the result of his experiment.

New music.—A young lady of high accomplishments, and no pride, in the absence of the servant stepped to the door on the ringing of the bell, which announced a visit from one of her admirers. On entering, the beau, glancing on the harp and piano, which stood in the apartment, exclaimed, "I thought I heard music—on which instrument were you performing, Miss?"—"On the gridiron, Sir, with an accompaniment of the frying pan!" replied she. "My mother is without help, and she says that I must learn to *finger* these instruments sooner or later, and I have this day commenced taking a course of lessons."

Contentment. There are two sorts of contentment: one is connected with and the consequence of industry, the other is the result of habits of indolence; the one is a virtue the other little better than a vice. No man ought to be contented and sit down quiet under any evils which he can conquer by his industry. It is easier to act than to suffer; and by taking timely care and pains, we avoid great cares and pains.

Poverty is a great enemy to human happiness, let philosophers say what they will upon the subject. Therefore, endeavor, by all lawful means to place yourself at least in comfortable circumstances; and whatever may be your income, resolve to prevent your expenses from exceeding it.

Sorts of sense. There are several sorts of sense, such as common sense, fine sense, and exalted sense; but common sense is of more value to its possessor than all the rest. Common sense is a true light which shows a man the path of rectitude, but the other kinds of sense are often false lights, which lead to ruin.

SILK.

Concluded from page 76.

The female cocoons, as before noted, are generally larger than the males, and not so much pointed as these are, and are without the ring or depression in the middle, which commonly distinguishes the cocoons containing the latter.

Eight or ten days after the deposition of the eggs, the jonquil color peculiar to them will change to a reddish grey, and afterwards into a pale clay hue; they are of a lenticular form, and on both surfaces there is a slight depression.

Preservation of the Eggs.

Collect the eggs which have fallen on the cloth covering the shelves of the tressel when quite dry, put them in a box, and, if numerous, in layers not more than half the breadth of the finger. The cloths raised from the tressel when quite dry, are to be folded and placed in a dry room, the temperature of which does not exceed 55°, nor below the freezing point, 32°.

During the summer, the cloths must be examined, every month, to remove insects; and to preserve the cloths always in fresh air, if the quantity be large, place them on a frame of cord attached to the ceiling, or radiator.*

There exists a notion that every two or three years the eggs should be changed. It requires little to be said on this egregious error. To suppose that the good cocoons of a cultivator, after a few years, are no longer fit to produce seed, and yet that these cocoons can give good seed for the use of another, would be to admit a superstitious contradiction, which reason, practice, and science, alike condemn. A change of seed can only be necessary, when from great neglect, for a series of years, of the worms, a diminutive race has been produced. Worms properly treated, will never degenerate. On the subject of the degeneracy of silk worms, in the United States, the most positive information can be given.

Mr. Samuel Alexander, of Philadelphia, says, "I am convinced that silk worms, cultivated in Pennsylvania, instead of degenerating, improve: proof of which I possess, in comparing the cocoons of four years since, with those of the last year. I can say with truth, the worms hatched from the eggs I brought from the south of Europe, have produced annually better silk." The testimony of Mr. Sharrod Metcalf, of Caladen county, Florida, is still more decisive.

A sample of beautiful sewing silk, sent with his communication to the Secretary of the Treasury, was part of a parcel produced by worms, the stock of which he has had thirty years; and they were obtained from a maternal ancestor, who had possessed them many years before.

During all this long period, no degeneracy has been observed. Let proper care be taken of silk worms, and no deterioration will take place.

The time has passed when the idle reveries of Buffon, Robertson, DePlan, and others, respecting the tendency of nature "to belittle" and degenerate every thing foreign in the new world, were received as truths. Facts, proud facts, demonstrate not only the absurdity of their positions, but the superiority of every American animal and vegetable, when compared with similar productions in the old world.

To bake Cocoons.

Cocoons reel more readily, and yield silk of a superior quality, without killing the insect by either steam of hot water, or by baking them; but those who have not the means of reeling off their cocoons in two or three days after they are formed, or of selling them, must kill the insects they contain, or they will eat through, and spoil the cocoons by breaking the continuity of the thread. The easiest way to do this, is to bake them in an oven, which must be about as hot as when bread has been taken out of it. After picking out all the spotted cocoons, put the rest in flat baskets, filling them within an inch of the top;—cover them with paper, and a wrapper over it; put these baskets in the oven, and after an hour, draw them out, and cover them with a woollen rug, leaving the wrapper as it was. Let them stand five or six hours, to keep in the heat and stifle the chrysalis. Then spread them in thin layers on shelves, and move them every day (to prevent their becoming mouldy) until perfectly dry. It may be proper to state, that the birth of the moth may be prolonged a month by keeping the cocoons in a very cold, dry cellar. If the cocoons are kept over summer, they must be protected from ants, mice, and cock-roaches.

From the American Farmer

LAFAYETTE.

The following extracts from a letter from the great and good Lafayette, to the Editor of the American Farmer, written in all the simplicity of a pure and honest heart, have so much connection with the various subjects discussed in this journal, and display the venerable farmer of La Grange in a light so amiable, and so characteristic, that we venture to give them, in the assurance that he will excuse us for what we know will amuse and gratify our readers, as every thing does from the same pen:—

Paris July 14th, 1828.

My dear Sir—Your kind letter (May 28) has been gratefully received. I thank you for the information it contains, and for the care you have taken of the report relative to the Baltimore and Ohio railroad, in which it is needless to add that I feel most deeply interested. Be pleased to express to Mr. Thomas, and the other members of the company, my grateful acknowledgments and warmest good wishes. I am daily looking for news of the arrival of my friend Gay, Barbour, in England, and hope he may find time for a visit to La Grange.

Here is a letter from our beloved Frederick. He gives you an account of his health, and his progress, and I have only to add, that he is an excellent, very clever boy, and well calculated to make happy his parents and friends.

Permit me to introduce very particularly to you and to our friends at Baltimore, a young traveller, for whom I have much affection and esteem. It is the Duke of Montebello, son to the celebrated Marshal Lannes, who fell gloriously in the last war. He is going to visit the United States, and will sail from Liverpool.

The enclosed letter has been written by my friend and colleague M. Girod de l'Ain,* a judge of the Paris Royal Court, and a member of the Association of Naz, who possess the finest flock, I think, in Europe. Naz is situated in the depart-

ment de l'Ain, near the frontier. It seems to me that the publication of M. Girod's letter in the American Farmer, and a direct correspondence between him and you, may be useful to American agriculture. I send you samples of the ram and two ewes the Association have been pleased to choose for me out of their flock, and which are the finest, I believe, to be seen; also a sample of a young ram born at La Grange. The length of the wool, since the new process, is no more an object with the manufacturers of France: quality and fineness are wholly attended to.

Our friend Mr. Townsend has sent three turkeys, who have arrived in good health—one male and two females—two males, one from General Cooke, the other from York, Pennsylvania, which you know have been preserved; so that I have now on my farm none but wild males, and two females, that may keep the pure breed.

You know the fine mocking bird, given by your son Frederick to his young friends at La Grange, is dead. Every tender care was taken of him—there must be something in the change of climate obnoxious to this matchless bird. The loss has been much lamented.

I have also lost the terrapins. My only way to preserve and multiply them, is to receive a number of those who live in fresh water and on land: to let them loose in a pond intersected by small islands, and let them take care of themselves. The tortoises* have not lived—yet they had a better chance. The partridges could not bear confinement—I have now let them loose, and think they will multiply. The swan-geese† are in perfect health, male and female, but hitherto have given no progeny. They are fine birds and a great curiosity.

I have much admired the fine samples of wool sent by Mr. Dickinson, [of Ohio] to whom I beg you to offer my best thanks, as well as to the gentlemen who have collected the curious diversity of Indian corn. I thank you for the particulars you are pleased to give in the American Farmer, and beg my affectionate acknowledgments and compliments to Mr. Niles for the precious continuation of his Register. The steam boiler, presented by Mr. J. B. Morris, works admirably well on my farm, and enables me to feed my cattle, my ewes in the suckling time, the fattening animals, and a stock of hogs, either full blooded from your fine pigs, or crossed with the English, and Anglo-Chinese breed. Happy would I be to welcome you on my farm. As I am sending you samples, here is a specimen of observations at the French Institute. I have received a young dog from the Pyrenean mountains, and if I preserve it in growing health, shall send it to you.

My letter has been interrupted by a visit from Frederick, who came to take leave on his return to Fontenay. His health is perfectly restored. I have had the pleasure to see Mr. Cochran. Time is approaching when our boys come to La Grange.

Adieu, my dear sir, most truly

And affectionately, your friend,

LAFAYETTE.

Paris, June 19th, 1828.

My dear General and honored Colleague—Understanding that the citizens of the United States, actuated by an enlightened zeal, are turning their

* A barrel hoop, crossed with stout pack-thread, will make a good frame. A small quantity may be kept in a tin case. If a board box be used, the joints and edges of the top should be pasted with paper to exclude ants.

* A distinguished member of the Chamber of Deputies and one of the leaders of the liberal party.

† These were from Florida.

‡ Sent by S. W. Faneory, Esq. of Brighton, Mass.

attention to the raising of Merinoes, and procuring the best rams from our continent, I have thought that the Agricultural Society of Naz, of which I am a member, might open with the Americans a communication beneficial to both. I do not wish, however, to proceed in the subject, without consulting you, my dear colleague, whom so many and such glorious ties connect with that country, and who are better able than any one else to decide whether the reputation of the Merinoes of Naz is deserved, as you have several, selected with all the care that was to be expected from the friendship with which you honor me;—and among which there is one which I would pronounce, but for the fear of appearing presumptuous, the finest ram in Europe. Permit me therefore, to ask your advice on the subject of this design, and to solicit, if you think it practicable, your assistance in carrying it into execution. Accept, I pray you, my thanks in advance, and pardon me for imposing so much upon your kindness. Be assured, my dear colleague, of my respectful affection.

GIROD DE L'AIN.

The samples may be seen at the office of the American Farmer; and the Editor wishes a few samples of the *finest* wool from sheep *reared and reared in America*. Any gentleman possessing sheep yielding wool of extraordinary fineness, will oblige us by small specimens, with memoranda as to the origin of the original stock. The specimens will be sent to M. Girod, and will, perhaps, shew him, that whilst we are grateful for his good wishes, we have now got individuals from which to propagate a race equal to any in Europe: we say *perhaps*, for that must depend on the samples we can supply. The longer the *stock* of the sheep from which such samples may be selected has been in the country, the better they will serve to exhibit the influence of our climate and the success of our management.

Editors of papers who may see proper to copy the above, will enable us the more fully to reciprocate the proffered interchange of good offices. Philosophy and benevolence are of no country, and know no boundaries in their desire to promote useful knowledge and the well being of society.

It is mentioned in a Haverhill paper, that Sherill Bartlett has attempted the cultivation of the sweet potato, or yam. In a garden in this town, we have seen this plant flourishing with as much vigor as if it spread beneath a southern sky. The leaf resembles that of the common garden bean—and the vine extends on the ground to the distance of several feet from the root, sending out little fibres at short distances to confine and nourish. The prospect of a good crop is at present fair. The riches of our soil, the resources of our climate, and the power of vegetable accommodation to both, have as yet been imperfectly explored. The spirit of improvement might spread the purple clusters of the grape over the hills, ornament our gardens with the graceful stalks of the cotton, and the magnificent foliage of the tobacco, and give to the table those fruits which have heretofore been the luxuries of southern climates.—*Worcester Agis.*

Strawberries.—I have been induced to make the present communication, from having been informed by a young man from near Salem, of the man-

agement of a bed in his father's garden, which was planted about twenty years ago, and still continues very productive. It contains about two square perches—and the present season twenty quarts were gathered in a morning, and strawberries measuring three inches and three-fourths round, were frequently found. The manner in which this bed has been managed and made so productive, is, as soon as the fruit is all gathered, mow the vines close off, and cover the bed four or five inches with rotten wood, drawn fresh from the wood land, where old logs have been left to decay. The strawberry vines will shoot through this covering, and there will be no farther labor necessary, but to keep the running vines cut off to prevent their taking root: twelve inches square was the distance at which the plants of the above described bed were planted.—*Vegetable Record.*

Painting houses.—A writer for the New England Farmer, whose communication was published vol. i. page 314, says, "I believe it is a general practice for people to do their painting sometime during the three summer months: but repeated experiments have been made within a few years, which prove that a house painted late in autumn or in the winter, will hold the paint *more than twice* as long as one painted in warm weather. The reason is obvious—for when paints are applied in cold weather, the oil and other ingredients, form a hard cement on the surface of the clap-boards, which cannot easily be crased: whereas, a building painted (as usual) in the heat of summer will soon need a new coat: for the heat causes the oil to penetrate into the wood, and leaves the other component parts dry, which will soon crumble off."

Hop shoots.—These are seen in spring through out the month of April in the German markets in great abundance on every vegetable-stall, being cultivated as a regular garden product. From their whiteness, without any trace of green, they should seem to be procured, as in the case of chicory by removing the earth into which they shoot, and breaking them them off before they have appeared above ground: and the same plant probably acquired with the asparagus, which is usually perfectly white.—*Gardner's Mag.*

Mortar.—The use of lime in mortar, is to fill up the hollow spaces or vacancies between the grains of sand, and to cement them together, thereby forming a kind of artificial stone. To add more lime than is sufficient to fill up these spaces seems to be useless, and to add much more must weaken the mortar; but if too little lime be used, there will be cavities left between some of the grains of sand, and the mortar will consequently be short or brittle: therefore, when we cannot ascertain the best proportions of lime and sand, it is better to use too much lime than too little.

A very extraordinary cowslip has been picked in the garden of Mr. Sheriff Danahy, in Stockton lane, near York. The stem, which has the appearance of six stalks grown together, supports a head of flowers, comprising one hundred and fourteen pips. The stem itself was above eight inches in length. Several other cowslips of unusual size were also growing from the same root.

To make an Indian pudding.—Stir two quarts of skim milk—stir in one pint of Indian meal, or enough to make very thin mush, and a little salt, a tea-cup full of ginger, or a little of any other

spice you may like. Put it in a tin or earthen pan, and bake it in the oven three hours. It eats well without, but better with a lump of butter, and is a luxury superior to rice or custard.

Cure for the Tetter-worm.—Take a lump of rock salt, size of a common hickory nut; the same quantity of alum and copperas—burn them separately on a shovel and pulverize them together—then put them in a bottle and pour in half a pint of very strong vinegar—and every night on going to bed wash the part affected, with a soft rag.

Potato onions.—One of our neighbors, (says the Seneca Republican) showed us the other day, some onions, raised in his garden, of the kind called *multiplying*, or *potato onion*: from one of which (planted in the spring) he has got the astonishing product of twenty-eight fine onions.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 10, 1823.

To destroy grubs, wire-worms, and other insects.—The following article was published some time since by the Highland Society:—"The following preparation is highly recommended as a valuable remedy to vanquish, if not entirely to exterminate all the tribe of vermin that prove so injurious to the industry of those who cultivate the soil:

Take tobacco leaves, cut them small, and make a strong infusion of them, by pouring hot water upon them in a tub. The infusion must not be boiled, as that would carry off by steam a great part of the most valuable principle, the essential oil of the tobacco. When this infusion is cold, dissolve in one or two pounds of common gum arabic: and when the latter is dissolved, a pound or more of flour of sulphur may be added; particularly if it is intended to give a smart washing to wood and trees. It is conceived that from January to March (if the weather be mild) is the best time for the application of the above infusion to wash from trees, and to all kinds of gooseberry and currant bushes, previous to pruning them, and wash clean round their stems. Some days after the first washing, which may be done with a watering pot or garden engine, it will be beneficial to prepare a portion of the infusion with an additional quantity of gum arabic, to be applied with a brush to the stems of the bushes, at least for a foot or more above the ground. The air of the atmosphere will generally keep the gum moist, and any vermin that may rise from the earth in the course of the spring will be arrested by the quantity of the tobacco will kill them effectually. There is one species of grub that never quits the ground until it becomes a caterpillar. This species destroys cabbages and cauliflowers by attacking the roots about an inch below the surface of the earth. It will, therefore, be necessary before these vegetables are earthed up, to give a small portion of the infusion to each plant from a watering pot; and it is farther recommended, when these plants are taken up to be transplanted, that the roots be put into the infusion for a few minutes before they are dropped into the earth. It is wonderful how much this infusion promotes the vigor of vegetation, when it gets to the root of any plant. Vipers, which are common in gardens in England and the south of Scotland, will soon forsake the garden in which this infusion is used freely. The essential oil of tobacco, if applied to

the mouth of a viper upon the tip of a small rod, will kill the reptile to a certainty. This oil will kill the most poisonous snakes of warm climates. The tobacco leaf yields a considerable quantity of essential oil, which is readily obtained by smoking tobacco in a nipple-glass. The oil will condense in the bulb of the glass; and is so caustic, that it will destroy the epidermis when it touches the human skin.

REMEDY AGAINST THE CANKER WORM.

Mr. Abel Houghton, of Lynn, Mass. has invented an apparatus for protecting trees from the ravages of the canker worm, which promises to supersede the necessity of making use of the laborious processes of tarring trees, which are the only remedies against this very serious evil, whose efficacy has been established. Mr. H. surrounds the tree with a strong piece of paste-board, painted and made impervious to water, and curved in such a manner as to form a channel, or hollow place, round the body of the tree. This channel is to be filled with oil, and thus presents a barrier, which the insects cannot pass. Immediately above this channel another piece of paste-board covered with painted canvass, is fixed, surrounding the body of the tree, and projecting over the channel, (like the rim of an inverted tunnel) in such a manner as to protect the lower part of the paste-board from rain, dew, &c.

A late number of the *Lynn Mirror*, contains the following recommendations of this invention: "We, the undersigned, having been for several years witnesses to the destructive ravages of the canker worm, and to various methods which have been used to preserve trees from its depredations, all of which have proved ineffectual: have lately examined an apparatus for preventing the ascent of the grub and other insects, invented by Abel Houghton, of this town, which appears to us to possess peculiar advantages over any other method which has yet come to our knowledge; and it is our opinion that it will answer the intended purpose. It is simple in its construction, and may be procured at a moderate expense:

Isaiah Breed,	Isaac Bassett, Jr.
James Pratt,	Estes Newhall,
Jesse L. Atwill,	William B. Brown,
Mannuel Austin,	Micajah C. Pratt,
Isaiah Chase,	William Bassett,
Israel Buffum,	George Todd."

Mr. Houghton, (the inventor of this apparatus) has promised us further information on this subject, which we shall be happy to publish; and we wish Mr. H. may be as successful as the object he is attempting to obtain, is important.

Since the above was written, Mr. Houghton has left a model of his invention, for inspection, at the office of the N. E. Farmer.

Profitable gardening.—We can state, on undoubted authority, that one market gardener has realized from the produce of four pounds of the Early Dutch Turnip seed, \$300.00—for the turnips sold in the Fulton market, New York, from the middle of June till the middle of July—when the heat began to spoil them, and he ploughed the remainder up, (as he could well afford to do). The genuine early Dutch turnip is small, white, peculiarly delicate, and comes very early for summer use. We have a quantity of the genuine seed, (raised from the roots produced from imported seed) for sale at the New England Farmer Seed Store.

BRIGHTON CATTLE SHOW.

The Show at Brighton will take place on Wednesday next, Oct. 15th. The examination of animals, and the ploughing match will take place precisely at 9 o'clock. Dinner at 2 o'clock, immediately after which, the premiums will be announced, at Mr. Austin's Meeting-house. As fruit is scarce, and as it is always desirable to exhibit specimens of horticulture on this occasion, the Committee of the Trustees request the friends of horticulture to contribute something out of their abundance towards the exhibition. Extraordinary productions of vegetables will also be thankfully received.

J. LOWELL,
J. HEARD, Jr. } Committee.
B. GUILD.

N. B.—Tickets for the dinner may be had at the N. E. Farmer office—at Welis & Lilly's—at the Mansion-house Hotel, Brighton, on the day of the Show, and of Mr. Kuhn, at the Hall of the Society.

FREDERICK HOWES, Esq. has been elected President of the Essex Agricultural Society, vice T. PICKERING Esq. resigned.

Rev. Mr. Dean, of Scituate, is expected to deliver the Agricultural Address at South Bridgewater, at the Plymouth county Cattle Show, November 5th.

The Cattle Show, Exhibition of Manufactures, &c. of the Hampshire Franklin and Hampden Agricultural Society, will take place at Northampton on Wednesday and Thursday, October 22d, and 23d. The Address will be delivered by PATRICK BORS, Esq. of Granville.—Liberal premiums are offered for Neat Cattle, Horses, Household Manufactures, Cider, Fruit Trees, and Locust Trees.—Several discretionary premiums are to be awarded in volumes of the *New England Farmer* and *New American Gardener*.

The Cattle Show and Fair, of the Merrimack, (N. H.) Agricultural Society, is to take place at Loudon Village, on the 15th and 16th of October. Twenty premiums are awarded in volumes of *New England Farmer*.

The Cattle Show, Exhibition of Manufactures and Ploughing Match of the Bristol Agricultural Society is to take place at Mansfield, Oct. 28.

Rules and Regulations for the Cattle Show, &c. at Brighton, Wednesday, October 15th. 1828.

TIME OF ENTRY FOR THE PREMIUMS.

1. Manufactures & Inventions—Butter, Cheese, Honey, Cider and Currant Wine, before 9 o'clock, A. M. on Tuesday, the 14th, and to be deposited at the Hall and ready for exhibition before 10 o'clock, A. M. of the same day. [The Hall will be open on Monday, the day previous, for the deposit of articles.]

2. Stock of every kind to be entered by letter, (post paid) specifying the animals; or by personal application to JONATHAN WINSHIP, Esq. at Brighton, Secretary of the Show, on or before Tuesday the 14th; and a certificate will be given of such entry, bearing the number of the pen assigned.

3. Ploughs for the Ploughing Match to be entered before 9 o'clock, A. M. on Wednesday the 15th.

4. Working Oxen on or before Tuesday the 14th.

EXAMINATION FOR THE PREMIUMS.

1. The Committee on Inventions, that on Manufactures, and also the Committee on Butter, Cheese, Cider, Currant Wine and Honey, will commence their examination of the articles entered in their several departments, at 10 o'clock, A. M. on Tuesday the 14th.

2. The Committee on Stock at 9 o'clock, A. M. on Wednesday the 15th.

3. The Ploughing Match will take place at half past 9 o'clock, A. M. on Wednesday the 15th.

4. The Trial of Working Oxen at eleven o'clock on the same day.

5. The Auction for Animals and Manufactures at 12 o'clock, M. on the same day.

RULES TO BE OBSERVED BY COMPETITORS FOR THE PREMIUMS.

1. All Stock to be in the Pens before 9 o'clock A. M. on Wednesday.

2. No animal to be removed from the Pens but by permission of a Marshal.

3. Fat Cattle are to be weighed before being put into the Pens, at the expense of the owner.—No animal not bred within the State can be offered for a Premium.

4. The working Oxen to be arranged on the right hand of the Avenue from the road to the Hall, with their heads toward the centre; and the drivers are to remain with them there, until the time for the trial.

5. A certificate will be required that articles of manufacture offered for premium were wrought within the State—to be delivered to the Secretary at the time of the entry—who will furnish for each parcel to the person presenting it, a label with a number corresponding with that of the certificate of the entry; to be annexed to the parcel.

6. No Competitor for any premium to be present during the examination unless requested by the Committee;—the claimants of the premiums for Inventions excepted, who will be required to attend on the Committee to answer such questions as may be put to them; and also to exhibit sufficient evidence that such inventions as are offered by them are of profitable use.

7. After examination the goods will be considered in charge of the owners, but must remain for public inspection until after the auction on Wednesday the 15th, but a night watch will be provided by the Trustees.

8. Each parcel of butter, cheese, honey, cider, and currant wine must have upon it the private mark of the owner. The cider and wine to be accompanied with a written statement of the method of making and managing the same.

9. The barrel of cider which obtains the first premium will be used at the Society's dinner, on the 15th, and five dollars allowed for the same in addition to the premium.

10. Notice must be given to the Secretary, of the animals and manufactures to be sold at the auction, in season for a list to be prepared for the use of the auctioneers. The sale to be in the order of the entries.

11. The services of the auctioneers will be gratuitous; but the government duty must be paid by the owners. The owners will attend to the delivery to purchaser, and collect the purchase money.

Particular Notices.

1. The Society will meet at the Hall at one o'clock, P. M. and proceed thence, accompanied by the Committees, invited persons, and other

gentlemen, who intend to dine with the Society, to the Meeting-house, where the Premiums awarded, will be announced by the Assistant Recording Secretary. A procession will then be formed to the Mansion-house Hotel, where a public dinner will be provided.

2. The Treasurer will attend at the Hall at 5 o'clock, to pay such premiums as may then be demanded. And also on Thursday, the 16th from 9 o'clock, A. M. till 12. Persons most distant from home to be first paid.

3. Premiums not claimed within six months to be considered as generously given to aid the funds of the Society.

4. Mr. Jacob Kuhn will attend at the Hall to deliver certificates of membership to persons elected members of the Society, at the meeting on the day of the Show, and to others who may never have received their certificates. The sum of five dollars to be paid on admission is in lieu of all assessments, and entitles the new members during life to a copy of any publications which the Society may hereafter make.

5. No persons will be admitted to the Hall except such as have business there, on any day but the day of the Show.

6. The avenue between the ranges of Pens is intended exclusively for the Trustees, Committees, Members of the Society and invited persons. The Marshals will therefore be instructed to admit no other persons.

No booth, or tent, or place for the sale of liquors of any kind, will be allowed within the grounds belonging to the Society. Nor will any openings through their fences to adjoining lots be permitted.

Tickets for the Society's dinner may be had of Mr. Kuhn at the Hall, and at Mansion-house Hotel.

Cultivators of fine fruit are requested to send samples for exhibition at the Society's dinner.

Vegetables remarkable for size or other qualities, will have a place assigned them for exhibition at the Hall.

Gentlemen who have fine animals that do credit to the country, are requested to send them to the Pens for exhibition, if not for premium.

The Marshals, Capt. Isaac Cook, Capt. William Prentice, Capt. Joseph Curtis, Jr. and Zebedee Cook, Jr. Esq. will be aided by the civil authority agreeably to the special law of the Commonwealth, in keeping the peace, preserving order, and enforcing a compliance with the regulations.

JOHN LOWELL, } Committee
JOHN BEARD, Jr. } of
BENJ. GUILD. } Arrangements.

Wilson's Nursery, Derry, N. H.

The proprietors inform the public that their nursery offers peculiar facility for the acquirement of useful fruits; more than fifty thousand trees now cultivated by them, consisting of a great variety of Apples, Peaches, Plums, Cherries, Quinces, &c. embracing most of the celebrated and esteemed kinds in this country. The utmost care has been observed by the original proprietor for more than thirty years, in making the selection and the whole is now offered as containing none but the most worthy of cultivation. Persons not acquainted with the different kinds by name, who wish to procure choice kinds, by sowing the time they wish them to ripen, may confidently trust to the proprietors without fear of disappointment. All orders will be promptly attended to, and trees furnished at their nursery, this fall or next spring, at the following prices.

Apples, per hundred,	\$16
Peaches do	16
Plums do	25
Cherries do	25
Quinces do	\$16 and 25
Horse Chestnuts	25
Oct 3 6t	
JOHN A. & SAMUEL WILSON.	

FRESH SEEDS AND ROOTS.

Just received at the New England Farmer Seed Store, No 52 North Market Street,

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the *Rheum Umbellatum* or Tart Rhubarb, or Pie Plant, an excellent article for summer use.—(See N. E. Farmer vol. vi, page 290, and page 11 of this volume, and Fessenden's New American Gardener, article *Rhubarb*, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts. per ro.

Potato and Tree Onions.

Also, a supply of Potato and Tree Onions. The Potato Onion has proved a fine acquisition to the list of vegetables raised in this country, and is getting into general use in the Middle States. They have produced 12 and even 20 fold in this vicinity the past season; come much earlier than the common, are milder, and more sure of producing a crop. Price 6 cents each, 50 cts. per dozen.

Indian Corn.

Several varieties of Field Corn, selected with great care, for its earliness and productive quality—also Early Sweet and the Early Jefferson Corn, for the table.

Garden and Field Seeds.

The largest collection and variety of Garden Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. will be published in the course of a fortnight, and forwarded gratis to any one who will send for it.

Food for Silk Worms.

Thousands of White Mulberry Trees, in beautiful order for transplanting, may be had at the Kestrick Nurseries in Newton, on very moderate terms. N. B. The trees were produced from seed bought at this office.

Gentlemen in want of Fruit or Ornamental trees, Grape Vines, &c. are respectfully invited to call and look at this extensive establishment, as an actual view elicits general admiration, and precludes all need of empty puffs.

Splendid Bulbous Roots.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, direct from Van Edele & Co. Harlem, Holland, a large assortment of Bulbous Flower Roots, comprising the finest varieties of

HYACINTHUS—(double and single) dark blue, porcelain blue, red and rose coloured, pure white, white with yellow eye, white with rose eye, and yellow with various eyes; from 25 cts. to \$1.00 each.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots 38 cts. each.

JONQUILS—sweet scented, finest roots 10 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 38 cts. each.

DOUBLE NARCISSUS—fragrant of all colors, 19 cts. each.

SPRING CROCUS—of all colours, 6 cts. each 50 cts. per dozen.

The above roots are from the same house, from whence we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinthus having produced bells 1 inch and 1 1/2 in diameter.

Purchasers are requested to notice that the above roots are *not purchased at auction*, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the mere refuse of the most inferior collections, and roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

Also, a further supply of Bulbous Roots, comprising Martagon and Tiger (spotted) Lilies—Low priced Hyacinthus and Tulips, 12 cts. each—Common Tulips at \$6 per hundred roots, raised in this vicinity. Their low price makes them an object to those who wish to form a handsome Tulip Bed—Large White Lilies, 25 cts. per root—Large Double 12 cts. each.

A further supply of Lilies, Persian Fritillaries, Iris, Ixias, Peonies, Anemones, Star of Bethlehem, &c. is daily expected. All orders faithfully executed.

Flower Seeds.

A fine assortment of Flower Seeds, comprising all the most fashionable and splendid varieties raised this season at Pepperell, Ms. expressly for this Establishment, neatly put up in small papers, 6 cts. per paper, \$8 per hundred, warranted; a liberal discount to traders.

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be published to-morrow, the *New England Farmer's Almanack* for 1829. By Thomas G. Fessenden, Editor of the New England Farmer. For sale, wholesale and retail, at the N. E. Farmer office, No. 52 North Market street, by Bowles & Dearborn, 50 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office.

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr. Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyard and nurseries, in the districts of Bordeaux, Clerac, and Bazet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1828.

Mr. A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities, where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to; the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1/2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1/2 cents for less than one 1/2; and 18 cents for less than 50 roots.—Payment to be made on delivery of the roots.—Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 35 Wall street—Boston, E. Copeland, Jr.—Albany, R. M. Michael—Philadelphia, Van Antwerp—Baltimore, Willard Rhoads—Washington City, Wm. Fano—Richmond, Davenport, Allen & Co.—Savannah, Hall, Shaper & Tupper—New Orleans, Foster & Hutton—Charleston, (S. C.) J. & J. Street & Co. Mr. A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal booksellers of the United States; and his agents will furnish them gratis to subscribers.

MISCELLANIES.

The following beautiful ode, written for a former occasion, by Wm. C. BRAYNE, was sung at the eighteenth anniversary meeting of the Berkshire Agricultural Society, on the 2d. inst.

Far back in the ages,
The plough with wreaths was crown'd
The hands of kings and sages
Untwined the chaplet round;
'Till men of spoil
Disdain'd the toil
By which the world was nourish'd
And blood and pillage were the soil
In which their laurels flourish'd.
—Now the world her fault repairs
The guilt that stains her story;
And weeps her crimes and the cares
That tora'd her earliest glory.

The proud throne shall crumble,
The diadem shall wane,
The tribes of earth shall humble
The pride of those who reign
And war shall lay
His pomp away;
The time that heroes cherish,
The glory can't in deadly fray,
Shall fade, decay and perish.
—Honor vans, o'er all the earth,
Through endless generations,
The set that calls the harvest forth,
And seeds the expectant nations.

A sharp retort.—The following *cut direct* is from the pen of the celebrated Sheridan. Lord Erskine declared in a large party, in which Lady Erskine and Mr. Sheridan were present, that "a wife was only a *tin canister tied to one's tail*," upon which Sheridan presented Lady Erskine with these lines:—

"Lord Erskine, at woman presuming to rail,
'Calls a wife a tin canister tied to one's tail.'
And fair lady Anne, while the subject he carries on,
Seems hurt at his lordship's degrading comparison.
But wherefore degrading? Consider aught,
A canister's polished, and useful, and bright,
And should that its original purity hold—
That's the fault of the *guppy*, to whom it is sold."

Temperance is the road of enjoyment, and where pleasure is the only object of pursuit, pain is the only object obtained.

Time, said Dr. Franklin is money. It may also be said that Time is *Life*—he who idles away or mis-employs a single minute, destroys a portion of his existence, and, to a certain extent, is guilty of suicide.

RULES FOR PRESERVING HEALTH.

(Chiefly collected from Lord Bacon and Dr. Franklin.)

A man's own observation, what he finds good of, and what he finds hurt of, is the best physic to preserve health; but it is safer to say "This agreeth not well with me, therefore I will not continue it;" than this, "I find no harm in this, therefore I may use it;" for strength of nature in youth passeth over many excuses which are owing a man till his age.

To be free minded and cheerfully disposed at hours of meal and sleep and of exercise, is one of the best precepts of long lasting.

Avoid envy, anxious fears, anger, fretting inwards, subtle and knotty questions, joys and exhilarations in excess, sadness not communicated.

Entertain hopes, cheerfulness rather than joy, variety of delights rather than surfeit of them;—

wonder and a miration, and therefore novelties; studies that fill the mind with splendid and illustrious objects, as histories, fables, and contemplations of nature.

Celsus gives it as one of the great precepts of health and lasting that a man do very and interchange contraries; but with an inclination to the more benign extremes; use fasting and full eating, but rather full eating; watching and sleep, but rather sleep; sitting and exercise, but rather exercise, and the like; so that nature be cherished, and yet taught masteries.

Exercise should precede meals, not immediately follow them; the first promotes, the latter, unless moderate, obstructs digestion.

If, after exercise, we feed sparingly, the digestion will be easy and good, the body light some, the temper cheerful, and all the animal functions performed agreeably.

Indolence, with full feeding, occasions nightmares, and horrors inexpressible.

In general mankind, since the improvement of cookery, eat about twice as much as nature requires.

Restless nights naturally follow heavy suppers after full dinners. Some, however, rest well after three meals; it costs them only a frightful dream and an apoplexy, after which they sleep till doomsday.

If you would preserve your health, see to it that you have a constant supply of fresh air in your bed chamber. A small sleeping room without a fire place, will soon debilitate the best constitution.

Some physicians are so pleasing and comfortable to the humour of the patient, that they press not the true end of the disease; and others are so regular in proceeding according to the art of the disease, they respect not sufficiently the humour of the patient. Take one of a middle temper, or, if it may not be found in one man, combine two, and forget not to call as well the one best acquainted with your body, as the best reputed for his faculty.

The only remedy for all diseases, is to be above the fear of death.

This is the season for trainings, (says the Hampshire Gazette) when the yeomanry are called from their homes and their business to march round meeting-houses, over stone walls, and Virginia fences. We believe, with a Vermont editor, that these trainings and reviews are a worse than useless expenditure of the time and money of our fellow citizens. At a regimental review at Bolton, Conn. last week, one man was instantly killed, and another dangerously wounded, by the bursting of a cannon.

Trees in public walks.—In planting public walks the Belgians do no as is often done in England, and America, think enough to squeeze the trees into holes barely large enough to contain the roots, and cut out the hard and sterile soil and then leave them to their fate. During much of last winter, (1826-7) many workmen were employed in digging out the sandy soil round scores of the trees on the Boulevards, Brussels, which, though fifteen or twenty feet high, and three or four inches in diameter, were not quite so luxuriant as the rest, and replacing it with rich, black surface mould, of which as the holes were ten feet square and above two feet deep, each tree had subse-

quently (allowing for the mass of earth left round the roots) at least one hundred and fifty cubic feet to strike its roots into. Equal attention is paid in pruning these trees, the rows of which consist of broad-leaved elm and lime alternately. The limes are trained and clipped flat and fan-like, and kept low so as to fill up the space between the elms, which are allowed to assume their natural form, but also receive a careful annual pruning. All the branches too crowded, or crossing each other, are cut off close to the stem, as well as several of the lateral twigs from each branch; the whole head of the tree, both branches and spray, being kept *thin* and *balanced*, and particular attention being given to preserve one central leading shoot, by cutting off that one least upright when the tree has parted into two.

Valuable recipe.—Dr. Godman has recommended the following certain and simple remedy for a common and fatal disease among children. He says, "whenever they are threatened with an attack of *croup*, I direct a plaster covered with dry Scotch snuff, varying in size according to the age of the patient, to be applied directly across the top of the thorax, and retained there till all the symptoms disappear. The remedy is found to be always effectual when applied in the first and second stages of the malady." The plaster is made by greasing a piece of linen, and covering it with the snuff.—*Mr. M.*

Grape Vines.

The subscriber offers for sale Grape Vines of several varieties the produce of his garden in Dorchester; among them are the following:

Isabella	White Muscat
Sweetwater	Black Hamborg
Black Cape	Elba
Queen	Muscadel
Early Oval	Alexander's or Schuykill

They are principally of one year's growth, planted under his direction and superintendence, are warranted genuine, and are in a healthy and vigorous state.

The subscriber proposes to continue the cultivation of such varieties of the foreign and native vines as are suited to this climate and that will thrive in the open ground in town or country.

Application may be made to the subscriber, at his office, No. 7 1-2 Congress Street, or at the Garden, to Patrick Kennedy, Boston, Oct. 3, 1828. ZEPHEDEE COOK, Jr.

Fruit Trees.

WM PRINCE, the Proprietor of the Linnean Botanic Garden and Nurseries at Flushing, Long Island, has the pleasure of informing the public, that his Nursery now contains 172 varieties of the Apple, 202 do. of the pear, 76 do. of Cherries, 139 do. of Plums, 25 do. of Apricots, 34 do. of Peaches, 29 do. of Nectarines, 10 do. of Almonds, 14 do. of Mulberries, 6 do. of Quinces, 16 do. of Figs, 16 do. of Currants, 15 do. of Raspberries, 47 do. of Gooseberries, 20 do. of Strawberries, 257 do. of Grapes, 600 do. of Ornamental Trees, &c. Above five hundred of the above kinds of Fruits are not to be found in any other collection in America. The different varieties cannot be otherwise than genuine as the greatest attention is paid, and nearly all the kinds are propagated from bearing trees. The Cherry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of J.R. Newell, at the Agricultural Warehouse, No. 52 North Market-street, gratis; and orders left there, or sent by mail, will meet prompt attention. Oct. 3

Hemp Seed.

A consignment from Troy, N.Y. of 50 bushels of Hemp Seed, growth of 1827; by the tierce or bushel.

Oat Meal, Oat Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine Bolus Oat Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few canisters of fine Oat Flour, neatly packed, at 50 cts. per canister.

Spring Wheat.

Just received a few bushels of prime Gilman Spring Wheat, growth of 1828, raised in Southborough, Ms.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VII.

BOSTON, FRIDAY, OCTOBER 17, 1828.

No. 13.

AGRICULTURE.

(Prepared by the Editor.)

ILLS OF IGNORANCE IN ENTOMOLOGY.

We are told that in Germany, the gardeners and country people, with great industry gather whole baskets full of the caterpillar of the destructive cabbage moth (*Noctua Brassicae*, Fab.) and then bury them, which as Roesel well observes, is just as if we should endeavor to kill a crab by covering it with water; for, many of them being full grown and ready to pass into their next state, which they do under ground, instead of destroying them by this manoeuvre, their appearance again the following year in greater numbers is actually facilitated. Yet this plan applied to our common cabbage caterpillar, which does not go under ground would succeed. So that some knowledge of the manners of an insect is often requisite to enable us to check its ravages effectually. With respect to noxious caterpillars in general, agriculturists and gardeners are not usually aware that the best mode of preventing their attacks is to destroy the female fly before she has laid her eggs, to do which the moth proceeding from each must be first ascertained. But if their research were carried still further, so as to enable them to distinguish the pupa and discover its haunts, and it would not be at all difficult to detect that of the greatest pest of our gardens, the cabbage butterfly, the work might be still more effectually accomplished.

Some larvae are polyphagous, or feed upon a variety of plants; among others that of the yellow-tail moth (*Bombyx chrysothana*, F.); yet gardeners think they have done enough if they destroy the web-like nests which so often deform our fruit trees, without suspecting that new armies of assailants will wander from those on other plants which they have suffered to remain. Thus will thousands be produced in the following season which had they known how to distinguish them, might have been extirpated. Another instance occurred to a friend when walking with a gentleman in his estate at a village in Yorkshire. His attention was attracted by several circular patches of dead grass, each having a stick with rags suspended to it placed in the centre. He at once discerned that the larva of the cockchafer had eaten the roots of the grass, which being pulled up by the rooks [crows] that devour this mischievous grub, these birds had been mistaken by the tenant for the cause of the evil, and the rags were placed to frighten away his best friends.—Nor could he convince him by all that was said, that the rooks were not the cause of the evil.—Even philosophers sometimes fall into gross mistakes from this species of ignorance. Dr Darwin has observed, that destroying the beautiful but injurious woodpeckers is the only alternative for preventing the injury they do to our forest trees by boring into them; not being aware that they bore only those trees which insects had previously attacked, and that they diminish very considerably the number of such as are prejudicial to our forests.

From these facts it is sufficiently evident that

entomological knowledge is necessary, both to prevent fatal mistakes, and to enable us to check with effect the ravages of insects. But ignorance in this respect is not only unfit to remedy the evil on the contrary it may often be regarded as its cause. A large proportion of the most noxious insects in every country are not indigenous, but have been imported. It was thus that the moth (*Tinea Mellonella*) so destructive in bee-hives, and the asparagus beetle (*Lema Asparagi*, F.) were made denizens of Sweden. The insect that has destroyed all the peach trees in St Helena was imported from the Cape; and in England (not to mention bugs and cockroaches) the great pest of our orchards, the apple Aphis, there is good reason to believe, was introduced with some foreign apple trees. Now, extensive as is our commerce, it is next to impossible, by any precautions, to prevent the importation of these noxious agents. A cargo, or even a sample, of peas from North America, might present us with that ravager of pulse, the pea-beetle (*Bruchus Pisis* L.); or the famed Hessian fly, which some years ago caused such trepidation in our cabinet, might have been conveyed here in a ship load of wheat. Lecytenoch's wolf (*Tinea granella*, F.) might visit us in a similar conveyance, from Holland or France. But though introduced, were entomology a more general pursuit, their presence would soon be detected, and the evil at once nipt in the bud; whereas in a country where this science was not at all or little cultivated, they would most probably have increased to such an extent before they attracted notice, that every effort to extirpate them would have proved ineffectual.

DAIRIES.

Nothing but milk and cream should be kept in dairies; nor anything that has a strong scent, although it may be sweet, should ever be placed in or near the milk room; but bad scents, particularly, greatly lessen the product of butter dairies, by preventing a complete separation of the cream from the milk.—*Walsh's Designs for Agricultural Buildings.*

LOFTS OVER STABLES.

Are bad places for both hay and corn; as these articles in that situation, must be more or less impregnated with the noxious effluvia arising from the stale and dung, as well as from the breath of horses, thereby diminishing the nutritive qualities of the food, and occasioning disgust to the animals that eat it.—*Ibid.*

A Maine paper, the Wiscasset Intelligencer, says that the crops of hay in that state the present season, have been abundant—the crop of grain tolerably good—of Indian corn there is a good supply, well ripened, and already mostly harvested—potatoes not so abundant—the crop of grain tolerably good—of Indian corn there is a good supply well ripened, and already mostly harvested—potatoes not so abundant as in some former seasons, but a pretty fair crop.

Hams after being smoked, may be preserved through the year by packing them in oats.

We have seen some further specimens of paper made from straw and from blue grass, according to McGaw's patent. The invention is said to prove entirely successful. A manufactory has been established at Chambersburg, in this state, and machinery, &c. is preparing for the manufacture of 300 reams a day. The paper is firm and strong, carries ink well, and is very suitable for wrapping, and it is believed, for hanging also, and for all other purposes where strong paper is required, and can be furnished at a price so much below that made from any other material as to supercede every other of the kind.—*Penn. Gaz.*

A new species of the Bejuco de Guaco, so celebrated in South America for its power of curing wounds made by the most poisonous serpents, is now in full flower in the stove of A. B. Lambert, Esq. of Bayton House, Wilts, (one of the Vice Presidents of the Linnaean Society,) running from one end of the stove to the other, and filling the house with the perfume of its flowers. It was raised from seed sent from Cartagena last year to a gentleman in this town, by Mr Watts, the British Consul there. The Theophrasta Americana, a most curious plant, with the appearance of a palm, raised from seed, brought from St Domingo, by Dr Hamilton, ten years ago, has flowered in the same gentleman's stove this summer for the first time.—*English pa.*

Agriculture.—The Montpelier (Vt.) Republican states that the prospects of the farmer are brightening in that quarter. Wheat and flour have taken a rapid rise. The former was selling last week at \$1.30 per bushel, and the latter at \$7 per barrel, and very probably will rise. This improvement in the prices of agricultural products is very properly ascribed in part to a prospect of an increased demand in Europe, and partly to the influence of the tariff in creating a market at home. The farmer may often be at a loss, as to the most favorable moment for disposing of his surplus produce. It would perhaps, be the safest policy, as a general rule, to accept of fair prices, without indulging extravagant expectations. We can do no more than give, from time to time, all the information in our power, as to the state of the market, leaving our agricultural subscribers to judge for themselves.—*N. Y. Statesman.*

Fall of leaves.—An article on this subject, translated from a paper by Prof. Vacher, in the Memoirs of the Natural History Society at Geneva, is given in Brewster's Journal for October, 1826, which appears to us to account for the phenomena of the fall of the leaf in a more satisfactory manner than any preceding theory. According to Prof. Vacher, every leaf consists of a distinct system of fibres, which have only a temporary continuity and unity with the shoot, kept up by a kind of adhesive substance, which, when the purpose of the leaf in the parent plant is served, is dried up or dissolved. "The adhesive substance is probably formed by some portion of the parenchyma interposed between the two systems of fibres. While this parenchyma is under the influence of the vegetable action, the adhesion is maintained; when this action ceases, the union is

dissolved, and the leaf falls." The reasonableness and truth of this theory, as far as respects dicotyledonous plants, becomes more obvious by reflecting on the difference between the decay of leaves and the decay of tendrils. The leaves of plants, grasses, bulbs and other Monocotyledoneae, in a strict sense, cannot be said ever to drop from the plants. Dr. Brewster judiciously observes, that M. Vaucher is the first who directed botanists to the organic structure at the base of the petiole; and he adds, that a similar arrangement probably prevails in the other parts of plants which successively drop off, and the connection of whose vessels with those of the stem, though necessarily intimate, is merely temporary. A new field is thus opened for botanical research.—*Gard. Mag.*

REPORTS OF THE WORCESTER AGRICULTURAL SOCIETY.

REPORT ON FAT CATTLE AND MILCH COWS.

The Committee on Fat Cattle and Milch Cows cannot express, in adequate terms, the gratification which they, in common with the multitude who have witnessed this day's Exhibition, received from that part of it which came under their peculiar cognizance. Eighteen fat oxen were entered for exhibition or premium, and sixteen were found in the pens. Among these they must first notice those offered for exhibition only, by the Hon. Joseph Estabrook of Royalston, who has long been favorably known throughout this and other counties as a distinguished farmer. He presented twelve fine oxen from his pastures which by estimation would average from twelve to fifteen hundred weight each when slaughtered, and from their excellent points, their fatness and their number, attracted the attention of every one. Among such a Jury, as they may from their number well be styled, it would not have been easy to select a Foreman, and the Committee are happy that their duty did not require any such distinction to be made. Among the other oxen the Committee noticed one offered by Capt Ephraim Mower of Worcester, which was a fine animal having most if not all the good points required in such an animal. They also viewed with great pleasure the fine grass fed ox of John L. Boylston Esq. which weighed 2310 pounds, and they do not hesitate to pronounce him a superior animal, doing great credit to the gentleman who presented him. And it was when viewing such animals that the Committee regretted the limited number of premiums they had to award. These were only two—One of fifteen dollars which they awarded to Capt. Benjamin Harrington for his native grass fed Ox, eight years old, weighing 2511 pounds.—And the second premium of ten dollars they awarded to Gen. S. Towne, for his beautiful six years old ox, weighing 2237 pounds, half Holderness breed. The ox of Capt. Harrington, as he certifies, has had no grain or meal during the last summer, and the committee were induced to award the premium to him on account of his fatness, although the ox of Gen. Towne was much the most beautiful animal of the two; and considering his keeping which till the present season was common and ordinary, and entirely without grain, his great degree of fatness and excellent condition, were subjects of high commendation. The ox exhibited by the President of the Society, for exhibition only, was worthy of the high place he held in the estimation of the committee among the very fine

animals they examined, and did honor to the stock which he represented.

Among the other cattle, there was exhibited by Capt. Harrington, of Princeton, a remarkably fine cow with calf, which weighs 1,663 pounds, and has been kept only upon hay and grass. She is half Holderness, six years old and added much to the interest of the show of animals.

Old England may boast of her roast beef—and Europeans may say that nature degenerates in her productions in America, but while New England produces such animals for the slaughter as have this day exhibited, we never need to fear the want of good eating, or fear the imputation of degeneracy in man or beast.

There were the uncommon number of eighteen milch cows entered for exhibition or premium, seventeen of which were in the pens. This was as it should be. It was doing justice to the county which has long been distinguished for its dairies. But more credit is due to one part than another of the county, since ten of them were from the town of Princeton, and eight of these were exhibited by one gentleman, (John L. Boylston, Esq.) for whose public spirit and interest in its concerns, the Society owe their acknowledgements. Of the sixteen, eight were entered for exhibition only, and the time of the committee will not permit them to do that justice which they could wish to the animals or to the gentlemen who exhibited them. Stephen Salisbury, Esq. exhibited a fine cow, seven years old, half Denton breed; and Mr. Richard Mills, of Worcester, exhibited a native cow six years old, of a fine quality. Mr. Asa Rice also exhibited a cow which was acknowledged to be a fine animal, and Mr. Boylston exhibited a beautiful Denton cow, and one other fine cow which the committee viewed with pleasure. And among the animals for exhibition, the remarkably fine cow of Col. J. W. Watson, Princeton, must hold a high place in the estimation and commendation of the committee.

Among the cows offered for exhibition only, the imported short horned Durham cow offered by our enterprising and public spirited fellow citizen Stephen Williams, Esq. of Northborough, was particularly noted by the committee. Others may dispute about long horns, and short horns, the committee unanimously agreed that let long horns be as they might, the short horned cow of Mr. Williams deserved their unqualified approbation. And having exhausted their epithets of approbation they can only add that Colonel Lincoln's cow deserved her share of them, offered as she was for exhibition only.

It was no easy task to award premiums where there were so many claimants, and their claims were so just. The committee regretted that Mr. Benj. Harrington, of Princeton, had it not in his power to furnish the requisite certificate as to the quantity of milk given by his cow offered for premium, during the month of September. But as he could not, she could not be considered as a subject for premium, whatever the committee might have thought, had such certificate been offered. She was a very fine animal, and the quantity of milk given by her in June, twenty-one quarts a day, shows how high her claims were upon the attention of the committee, and how strong they might have been upon them to award her a premium. After due deliberation, the committee are unanimously of the opinion that the first premium of fifteen dollars should be awarded to Mr.

Henry Sprague, of Spencer, for his four years old cow, half Holderness breed. The quantity of milk given by her, as certified, was twenty quarts of strained milk per day, from the first to the twentieth day of June—and from that to the first of October, eighteen quarts a day; although her keeping was upon grass, in company with thirteen other cows.

The second premium of ten dollars the committee awarded to J. L. Boylston, Esq. for his beautiful light red four years old cow, which produced during the month of June, an average of nine pounds of butter per week, and during the month of September, fourteen quarts of milk per day although kept with from twelve to twenty-one cows, and only upon grass. She is of the native breed, and her calf nine months old, a fine animal was exhibited at the same time.

The third premium of eight dollars, the committee awarded to Mr. Albert Stone, for his excellent cow twelve years old which produced as certified about eighteen quarts of milk during the summer months, and thirteen quarts per day subsequent to September. Although the certificate of her qualities in regard to milk was not so precise as the committee wished, yet when they took into consideration the calves fattened by her, her appearance, and the facts which were certified, they concluded to award for her the third premium.

For the fourth premium Mr. Boylston was his own competitor, and if he will present so many animals, so fine that there is little or no difference he must not complain if he himself should be called upon to decide, because "the doctors disagree." Upon examination and comparison, however, the committee awarded to him the fourth premium, of six dollars, for a dark red four years old cow, which averaged in her produce, nine pounds of butter per week during the month of June, and thirteen quarts of milk per day during September. She was kept with from twelve to twenty-one cows during the season, and only upon grass. In describing this cow the committee describe also the other four cows of Mr. Boylston, and they here again express their regret that they were limited in the number of their premiums, for where all deserve, it is difficult to discriminate.

If the committee have failed to notice any of the animals exhibited, in a proper manner, it arises entirely from their number, and the difficulty which arises in such cases in discriminating from recollection the several animals and their distinctive traits. In the case of Mr. Harrington the committee are so well persuaded of the merits of his cow which was exhibited for premium, to whom they were precluded from awarding a premium by the rules of the Society, that they respectfully suggest to the trustees the allowance to Mr. Harrington of his travelling fees according to the rules of the Society, if he does not receive them in respect to other animals exhibited by him. In addition to this, what some may deem dry detail, the committee beg leave to offer one or two remarks of a general character. They cannot but express their surprise, that any man will ever keep a *poor* milch cow when, as has this day been shown, animals so much more profitable can be kept at an equal cost. It is a deplorable want of economy, and worse even than that of a man who should invest his money in two per cent. stock, when he might as safely receive ten per cent. on his capital in any other way. No animal repays

so richly the charges of her keeping, as a good milch cow. She is a treasure to a poor man, and a source of luxury to the poor and rich alike.—It is in this light that she is an extremely interesting object, for good eating comes home to us all. We have heard our brother farmers talk of “living like poor folks,” when they had more luxuries in their dairies than they could dream of, till deprived of them. “Sir,” said an obsequious waiter at a city hotel, to a good honest yeoman of a neighboring county, as he handed him a pitcher of what city folks call *cream*, “do you like cream in your coffee?”—“Yes,” said he with a sigh, “a plaguey sight better than skim milk.” Most of our best eatables derive their origin from our milch cows. But the quality of the one depends upon that of the other. It is in vain that the housewife sets the milk if it is not of a rich quality. She may select her pans with the skill of an Humphrey Davy; but it matters not whether of tin, or earthen, or what not, for if the cream is not in the milk, she cannot get it out. She may warm it, or cool it, skim it or churn it all together; poor milk will make poor butter. All the patent churns that Connecticut ingenuity ever invented, or Dr. Thomson ever puzzled his brains over, could not make *sky blue* milk into *yellow cream*, or white frothy cream into hard sweet butter. Such milk and butter, some may think, may do for hired men and boarders, but when we think of one's children, (especially those of us who have none) this becomes a subject of grave consideration, since the raising and education of children have employed all sorts of talents from those of the school dame among her A B C's, up to a Brougham in the halls of Parliament. As a committee on milch cows, we would modestly suggest that theorists do not begin at the foundation of the matter. We believe a good deal in the blood and breed of animals, but do not attach so much importance to mere names as some have done. But when we come to eating, we would fore-swear, for children, “*thin potatoes*” as heartily as Jack Falstaff in the play. We could quote even sacred writ in favor of milk diet, but we need only refer to the good old times of bread and milk suppers, when *slaps* and *nie-naes* were not the *stuff* of life, and when the rich bloom of health on the cheek of childhood, like the brilliant hue of twilight on a summer's day, played around the features even of old age, making it fresh and fair and vigorous. Bodily and mental vigor are too nearly allied, not to attach importance to what promotes either. And as friends of the rising generation, as the lovers of good order, and good eating—of good education and good bread and butter, your committee would earnestly recommend all who have viewed, with them, the animals this day exhibited, to sell their poor cows and buy good ones.

By order of the Committee,

EMORY WASHBURN—Chairman.

MIDDLESEX CATTLE SHOW.

The Society of Middlesex Husbandmen and Manufacturers held their anniversary Cattle Show in Concord, on the 8th inst. The pleasantness of the day brought together an unusual number of citizens and members.

Twenty teams were entered for the Ploughing Match; of which 17, viz. 9 single and 8 double, were found qualified by the rules of the Society to contend for premiums. The plot of ground set out in lots of 1-8th of an acre each, was well swarded

and well calculated for a fair trial of the skill of the Ploughmen. At 15 minutes after 9 o'clock 17 teams commenced the match, and the work was performed with a neatness and skill in execution, which has seldom, if ever, been equalled.—The discipline of the teams was admirable. There was no noise or whipping, and the teams all completed their work within 30 minutes, without exhibiting any appearance of fatigue. The procession of officers and members formed, and proceeded to the meeting-house, where prayers were offered by Rev. James Howe of Pepperell, in a manner well adapted to the occasion, an able, useful, and learned Address was delivered by the R. V. BERNARD WHITMAN of Waltham, and singing was performed by a select choir in a skillful manner.

After the exercises at the meeting-house, the Committees proceeded to the discharge of their respective duties. The working Oxen presented a most interesting exhibition. Twenty-one pairs were entered for premium, and their qualities were tested by drawing a load of 7000 weight. Many pairs exhibited great strength and docility, and the appearance and discipline of the oxen gave evidence of manifest improvement in that kind of stock.

Two fine and superior specimens of cider were presented to the Society, one by Mr. John Cooke of Cambridge, the other by Mr. Jonathan Rice of Marlborough. Each specimen was very nice, and the preparation simple and of little expense. The Society was highly gratified to see a competition in exhibitions of this article. Good cider is a great desideratum, and that our cider may be improved to a superior degree, the specimens exhibited, give abundant evidence—no labor will be better rewarded, than that bestowed in the preparation of cider.

The pens, 60 in number, were all filled. The horses, neat stock, and swine, were considered superior to any heretofore exhibited. The gradual improvement in neat stock in particular, so clearly manifested by our annual exhibitions, must be gratifying to the community.

One of the greatest agricultural curiosities of the season, was the two great water melons, of Mr. Gale, of Waltham, weighing upwards of 50 lbs. each, from one vine.

The exhibition of manufactures was good.—There was great competition in flannels, carpets and diapers, and gave evidence of improvement in this branch of household manufacture.

A piece of Rob Roy plaid made by Messrs Sewall, Standley & Co. of Draut, attracted much notice.—Several hearth rugs and many specimens of lace work shewed that our fair friends have not been idle in preparing for this exhibition.—There were several articles presented which were worthy of premiums, but the limits of the Committee did not permit any further rewards.

There were several inventions of great merit, and attracted particular attention.

The butter presented for premium was fine, particularly that of Mrs Willington, of Ashby.—As also several boxes of late made butter which did great credit to the makers but were not by the rules of the society entitled to premiums. *Team*

FOR THE NEW ENGLAND FARMER.

STAGGERS IN SWINE.

MR FESSENDEN—In the first number of the seventh vol. of the N. E. Farmer, a writer has in-

troduced the subject of the staggers in swine, and requests that it may be further investigated by those who profess any knowledge of the disease. I have been conversant with the disorder, it having repeatedly attacked my swine. In vol. iv. p. 88 of the same work, I gave some account of it. I then added that the pig which survived, was then, three weeks after the attack, as healthy as the others. I was probably led to this conclusion, from the greediness with which he devoured his food; but I soon found cause to regret the success of the surgical operations and medical treatment the poor animal endured. The expense of supporting it, I judged, was doubled in consequence of the disease. His growth was materially checked; and a gristly substance supplied the place of fat. I have lately conversed with a neighbor, who, at various times, has lost many of his swine by this disorder. His application was the depleting course by bleeding, and a powerful drench. Two only recovered. He stated the expense of keeping was more than any other two in his pens; and that their meat was of an ordinary quality, resembling rine. He expressed his determination never again to attempt their cure. This also is mine.

In J. P. De Grouchy's Letter to the late Judge Peters, published in vol. iii. page 396 of the N. E. Farmer, he remarks, that though by the method of cure he has adopted, he is much more successful; yet the pigs that recover *do not thrive so well after such an attack*. He mentions nothing of the quality of the pork, so noticeable in the instances above stated. The symptoms already indicate that bleeding is the best remedy. His recipe directs it. Those who can “see a bare knob in the roof of the mouth” may “cut it and let it bleed,” according to his practice: those who cannot, may do well to make an incision there as farriers bleed their horses. Should they swallow the blood, it may prove a sufficient cathartic. I have never searched for the “knob,” believing no more of its existence as an indication of disease, than of the worms in the tongue, which many cut out to keep a favorite dog from running mad.

Yours, with great regard,

Worcester, Oct. 9, 1828.

O. FISKI,

We are glad to see that the late improvement contrived by Mr. Grieve has drawn forth the notice contained in the testimonial below. We heartily join in the concluding tribute to the intelligence, activity, and enterprise which have marked his exertions, and hope that prejudice will not thwart their proper influence.—*New Herald*.

Thrashing Machine.

MR. THAYER,—Having this day witnessed the operation of a machine for thrashing and winnowing grain, invented by Mr. Wm. J. Grieve, at the Indian Hill farm, in West Newbury, we send you this notice, that an invention so valuable may become known. The machine was worked by four horses, and in seventeen minutes threshed and winnowed eighteen bushels of heavy oats, doing the work perfectly, threshing the straw clean, and separating completely the chaff, straw, and grain. To extensive grain-growing farms, this must prove a most valuable labor saving machine. Mr. G. removed from Scotland to this country more than a year since, and by his skill in farming, and implements of husbandry, promises to confer important benefits on our agriculture.

JOHN VARNUM.

J. H. DUNCAN.

ENGLISH CATTLE MARKET.

By the authority of the British Parliament, an examination has been made into the state of the cattle markets in the vicinity of London. The evidence given before the committee represents the most disgusting and cruel scenes; the streets of Smithfield were wet with the blood of slaughtered animals, and the offal was left in the gutters to the operation of the sun, producing the most horrible stench. It appeared by the evidence, also, that much meat was sold, which was unfit for eating; being "very old cows, skin and bones, and worn out bulls." The sheep were frequently driven into the market with one of their fore legs tied up to prevent their running away, and when thus disabled, the animals were goaded on by the inhuman drovers.

The state of Leadenhall market is thus described by one of the witnesses, (a surgeon) and he stated that similar cruelties were practised at hundreds of other places within the precincts of the city:—

A great part of Leadenhall is excavated, and the slaughter-houses are underneath. You descend a flight of steps several feet, (perhaps twenty feet) and you go into a dismal dungeon which is almost dark; there is a little light only, from the place that you enter—and around the floor of this place, covered with blood and filth and garbage, are the poor sheep lying in different places till they are killed. The persons who are employed to slaughter in these underground cellars appeared to me the most filthy, low, disgusting characters that can possibly be mentioned; I have seen them slaughter the sheep, and prepare the carcase with a horrid filthy bucket, containing blood and whatever may have been in it, as filthy and dirty as can be; I have seen them take a cloth and wash and wipe the meat all over with the water from the bucket, the most horrid, disgusting scene that can possibly be imagined. The place is so close that you cannot enter it without thinking of contagion. It is even worse than Whitechapel, inasmuch as these places are underground; there is no ventilation, and there is not the least check whatever to any cruel or filthy practices that the slaughtermen may choose to practice.

Merely sheep were slaughtered there, no cattle; they slide them down trap doors, and I have seen them frequently so crippled as not to be able to stand when they have reached the bottom, frequently with their jaws or legs broken.

The manner in which the cattle are slaughtered in most of the slaughter-houses is inconceivably dreadful and horrible. The cattle are sent to some of the large slaughter-houses to be slaughtered by slaughtermen employed by the man who keeps the premises; he takes in the cattle, and receives so much a head for their being slaughtered; he appoints a certain number of men, who are generally of the lowest possible description, to slaughter the cattle, and this business they perform without any observation or remonstrance or direction from the master butcher, or the man that owns the premises, or any one else, and they do it in any bungling cruel manner they choose to adopt. I saw an instance at the time I refer to, which was so dreadful it will never be effaced from my recollection, and I was not a solitary eye-witness, but other gentlemen were present. At Whitechapel, one of the bullocks was drawn up to the stake to be slaughtered, and when stand-

ing at the stake they are in the habit of fastening one of the hind legs, to the wall, but in doing so, it fell on its side; they wanted the animal to stand up on its legs, it was hampered with ropes, and hardly could, when one of the slaughtermen began to twist and break the tail, joint after joint; and then as if that was not sufficient to effect the purpose, he jumped upon it; another of the slaughtermen took up a drover's stick and beat it about the head in the most cruel manner, and goaded it in different parts of the body, to make it get up; but still the animal did not rise; then they called for a bucket of water, and I saw them pour the water down the nostrils, which was done for the purpose of giving the stimulus of suffocation, (for cattle breathe through their nostrils, not through their mouths); immediately after which, one of the slaughtermen took the iron axe and gave it six blows on the sides of the head (not on the vital part of the head) and it then roared with agony in a shocking manner, and got upon its knees, when they gave it the death blow, and it was killed. I state this only to show the manner in which slaughtering is conducted.

Another instance came under the eye of the same witness, in which the animal received seventeen blows from an axe, inflicted by ignorant men, before it dropped. This gentleman was a member of the college of surgeons, and his opinion upon this point may be worthy of some attention. He says, "the cutting the throat of the bullock with a very large knife, I consider to be the easiest possible death; but I very strongly object to their throwing the animal down, which is attended with a great deal of trouble and cruelty."

Driving cattle into the market was represented as a great nuisance. A bookseller testified that ladies were put to great inconvenience and terror by it, and that they would not go into the streets to purchase goods upon days when cattle were known to be there; he was satisfied that he had personally suffered a loss in his business in consequence of it. Sheep were driven through Hatton Garden upon the evening of the Sabbath, to the great annoyance of worshippers. Sunday evening was the noisiest of the whole week. It is not stated in the papers whether any measures has been taken to put an end to these disgusting scenes.—*Courier*.

SILK.

There is scarcely a day passes that does not bring us an account of some successful experiment in raising silk, in the South and West. The Ohio State Gazette notices a specimen of silk, of an excellent quality, made by Mrs. Daniel Parker, of Clermont county, in that State.—A day or two since, we received information of the success of an experiment made by Dr. M. W. Alexander, of Mecklenburg county, North Carolina. This gentleman raised two crops last summer, the last of which was superior to the first.—Another gentleman in the same State was very successful in raising silk, and contemplates entering into the business on an extensive scale. Indeed we have information from several of the southern and western States, of the extensive commencement of white mulberry planting with the same view. To obtain a mulberry orchard that will yield leaves enough for the most extensive establishment, would not require more expense or trouble than every farmer bestows upon a common apple orchard; and what is better? Old fields, or worn out

lands are admirably adapted to the growth of mulberry trees. Will not the farmers of the eastern shore find this a subject worthy of their attention?—*Baltimore Patriot*.

WHEAT PRODUCED IN FRANCE.

At a recent meeting of the Academy of Sciences in Paris, the Secretary read a paper on the "present and former produce of wheat in France," from which it appears that forty years ago the amount of wheat annually grown in France was sufficient (reckoning the population at that time at 25 millions, from which five millions are to be deducted for children under ten years of age,) to give to each person 583 lbs. of wheat per annum, or one pound nine ounces of bread daily, after taking away the wheat necessary for seed for the ensuing year. The population since the period here referred to, has increased to thirty-five millions, but there has been no increase in the wheat produce; from which it is inferred that the land brought into cultivation since the Revolution, has been chiefly laid out for vineyards, leguminous plants, and potatoes.

IMPORTANT INVENTION.

We this morning examined and saw in operation a most ingenious and valuable machine for spinning flax and hemp, invented by Dr Bell and Mr Dyer, two intelligent and highly respectable gentlemen from New England. They entered upon the prosecution of their plans last winter, and have now brought them to a successful termination. As the patent has not been secured, we are not permitted to give a full description of the invention; but the following particulars will be interesting to our readers, especially to those who wish well to the cause of American Manufactures.

This machine is constructed on an entirely new principle, having no analogy to the process for the cotton, woollen, worsted, or other manufacture.—The quality of the yarns produced is pronounced by competent judges, to surpass other linen yarns in as great a proportion as cotton or woollen yarns spun by the present improved machinery, are superior to those wrought by hand. The size of the thread can be varied to any extent, from that of cambric to that of the rope-yarns used in the manufacture of cordage. In the degree of velocity, its operation is limited only by the quickness which the spindles and fliers are capable of supporting. The instrument now in operation produces about the same quantity of thread per spindle, fineness being equal, as the *throstle spindles* in the cotton manufacture. The whole formation of the thread from dressed flax is completed at one operation. The material laid on the machine is wound upon the spools ready for the loom, without the intervention of any assistance; the whole being effected by the rotary motion communicated from *drums*. Indeed, all the motions of the instrument are of a circular kind.—*N. Y. State man*.

For fattening swine.—Wash potatoes clean, boil and mash while hot—mix in at the same time oats and pea meal. Put the mixture into a large tub, which must stand till it becomes sour but not putrid. Keep a quantity of this on hand, always fermenting and give it to your hogs as often as they will eat. It is said that pork may be fattened in this way and make a saving of one third of the food and time consumed in the usual mode.

CHESHIRE CATTLE SHOW.

The annual Cattle Show and Exhibition of the Cheshire Agricultural Society, was holden at Charlestown, on Wednesday the first day of October inst.; and though the income of the Society for this year afforded but small premiums, it is believed, that the show of cattle and other stock has not been on any former anniversary more extensive and more gratifying to the farmers and spectators assembled on the occasion. At 1 o'clock, the Society and citizens were escorted to the meeting house by an excellent band of music, where after prayer by Rev. Mr. Crosby, and a few appropriate remarks by Hon. H. Hubbard, the report of the awarding committees were read by Gen. William Carey of Lempster.

The officers of the Society for the ensuing year are the following.

AARON HODSKINS of Walpole, *President*,
 Sanna Hale of Keene, *Vice President*,
 Elijah Bingham of Alstead, *Secretary* and
Librarian,
 Leonard Bisco of Walpole, *Treasurer*,
 David Parker of Charlestown,
 Daniel Robinson of Acworth,
 Elijah Belding of Swanzy,
 James Chandler of Alstead,
 Levi Chamberlain of Fitzwilliam,
 Alvah Stevens of Claremont,
 Samuel Tutherly of Unity,
 William Jennison of Walpole,
Executive Committee.

POTATOS.

The crop of Potatos, in this vicinity, is below the average, and the quality generally, very indifferent. It is, therefore, of some importance that care should be taken to have them well preserved after harvesting, or they will become so poor before spring as to be of little value for cooking. The *Lancaster Gazette* says, "the best method should be resorted to of *keeping them dry*." This, we believe, is a mistake, and trust that no farmer will be induced to adopt it. Potatos do best when they are kept about the natural dampness of the earth, and excluded entirely from the air. The best mode of preserving them that we have ever seen adopted, was to pack them in light loam or sand, in bins or casks, without drying either the potatos or the earth in which they were packed. When so kept, they cook as well in the spring as when first dug. They should be picked as fast as they are dug, as it is found that two or three hours' drying, only, essentially injures them. It is well known that potatos which grow in a strong and rather moist loam, are better than those which are raised on a light or dry soil.—*Massachusetts Spy.*

To remove the musty flavor from wheat which has been damaged.—An English receipt book directs as follows: For every bushel of wheat take two pounds of potash, dissolve it in water with about double the quantity of wheat. Let the wheat be thoroughly washed in the solution, rinsed with pure water, and dried quickly.

In a letter to the Right Honorable Sir Joseph Banks, it is observed, "if wheat be musty, it must be put into any convenient vessel, capable of containing at least three times the quantity, and the vessel must be subsequently filled with boiling water; the grain should then be occasionally stirred, and the hollow and decayed grains, (which will float) may be removed. When the water has

become cold, or in general, when about half an hour is elapsed, it is to be drawn off. It will be proper then to rinse the corn with cold water, in order to remove any portion of the water which had taken up the must; after which, the corn being completely drained, it is, without loss of time, to be thinly spread on the floor of a kiln, and thoroughly dried, care being taken to stir and turn it frequently, during this part of the process."

Pearl barley as a substitute for rice.—It is equally advantageous to the public to learn the use of a known substance as the discovery of a new one. I am sure the application of barley to another branch of domestic cookery will not be disregarded by some of your readers. I can assure them that they will find it an excellent substitute for rice. It has been long used in this country in broth; and when boiled with milk, sometimes called Scotch rice; but by far the best way of using it is by pounding it in a mortar. In this form it fairly rivals manna-roop, tapioca or ground rice, and can be easily procured at one twelfth of the price of the first, and one third of the price of the last substance. It was resorted to as a change of food for my children's breakfast; and the great similarity to manna-roop induced us to try it in a pudding for them, and I can assure you, I think it one of the best of the kind—same management as with either of the others, milk, eggs, &c. &c. What we call pearl barley is the kind used; but I dare say, any of the kinds would answer.—*W. M. Argyleshire.*

It gives us pain to record, that the wheat crops throughout this district, notwithstanding their flattering appearance some weeks ago, have proved a general failure;—the only parcels which remain unhurt by the rust, are such as were early sown, and the winter generally. We observe also that in New Brunswick the winter wheat has yielded an excellent harvest, while the common wheat has suffered as with us. Farmers ought to profit by this information, and either sow their wheat earlier than in years past, or sow winter wheat in the Fall.—*Pictou, (N. S.) Sept. 10.*

To prevent Horses from being teased with Flies.—Take two or three small handfuls of walnut leaves, upon which pour two or three pints of soft and cold water—let it infuse one night, and let it boil for a quarter of an hour—when cold it will be fit for use. No more is required than to moisten a sponge, and before the horse goes out of the stable, let those parts which are most irritable be smeared over with the liquor, viz: between and upon the ears, the flank, &c.—*Belvidere Apollo.*

Recovery of drowned persons.—M. L. De Etoile states in a letter to the French Academy of Medicine, that he has succeeded invariably in recovering drowned animals, by the following galvanic application: A short and fine needle is inserted into the sides of the body, between the eighth and ninth ribs, so as to come in contact with the attachment of the diaphragm, and then a current of electricity, from twenty-five or thirty pairs of inch plates is passed through them. The diaphragm then immediately contracts, and an inspiration is effected. On breaking the communication and again completing it, a second inspiration is occasioned, and by continuing these means, a regular respiration is ultimately effected.

Hardening of Steel by a Current of compressed Air.—From the observation of travellers, that the manufacture of Damascus blades was carried on only during the time when north winds occurred, M. Anozoff made experiments on the hardening of steel instruments, by putting them, when heated, into a powerful current of air, instead of quenching them in water. From the experiments already made, he expects ultimate success. He finds that, for very sharp edged instruments, this method is much better than the ordinary one; that the colder the air and the more rapid its stream, the greater is the effect. The effect varies with the thickness of the mass to be hardened. The method succeeds well with case hardened goods.

Apoplexy from white lead.—On the inquest in the case of a man who died at a white lead establishment in London, a surgeon testified that within the last two years five of the hands employed by that company had been suddenly attacked, and three of them died. The verdict was apoplexy, and the cause was stated to be a neglect of cleanliness and keeping themselves free from the lead ore floating about in powder among the workmen.

Protecting the stems of fruit trees.—A writer for the Gardener's Magazine says, "last April, just as the blossom was about to expand, I had the trunk and larger branches of an apple tree in my garden, (Wyker pippin) enveloped with hay bands, leaving two other trees of the pippin kind, within a few yards of the one on which the experiment was tried to take their chance without protection. The nights of the latter parts of April, and of the first ten days of May were remarkably cold; a self-registering thermometer, indicating, on the night of April the 30th, a temperature 15° below freezing. This degree of cold proved fatal to the whole of the blossoms of one of the unprotected trees, and nearly so to the other—about a dozen apples being the total of its produce. But the protected tree seemed to be proof against the effect of the frost; and I do not exaggerate when I say that the crop was beyond all former precedent, and was the admiration of all who saw it—many of the branches being literally loaded like ropes of onions."

WORCESTER CATTLE SHOW.

The annual Cattle Show, Ploughing Match, and Exhibition of Manufactures, was held in this town on Wednesday last. The day was unusually pleasant—the concourse of people greater than ever—the number of animals much larger than heretofore—and the interest excited by the occasion, manifestly greater than that of any former year. Delegations were present from the Massachusetts Agricultural Society, from the Windham County (Conn.) Agricultural Society, and we believe, from other Societies.

At an early hour the gathering round the pens had commenced, and very soon a dense crowd covered the spacious common where they were located, which seemed not to be sensibly diminished, during the day, by the departure of those who attended the services at the meeting-house or of those who dined with the Society.

The Ploughing Match was at nine o'clock. At ten a procession was formed and proceeded to the South Meeting-House, where, after prayer by the Rev. Mr. Searles, of Grafton, a very interesting Address was delivered by W. S. Hastings Esq. of

Mendon, to a crowded audience. The President of the Society, Gov. LINCOLN, then briefly addressed the members for the purpose of giving the usual general statement of the condition of the Society. By this statement it appeared that the number of members is about 800, and the amount of the permanent funds, \$5000. Large as the number of members appears to be, it is small compared with the population of the County, which is about 80,000; and the President very pertinently appealed to the members, and to the citizens generally to augment the funds and thus increase the usefulness of the Society, by enlarging the number of its members. The names of the various committees were then announced, by Gov. Lincoln—the Chairman being designated solely for the purpose of assisting the Committees in drafting their Reports, having no voice in awarding the premiums unless in case of an equal division of the members.—*Worcester Freeman.*

✍ We have not room, this week, for further sketches of the proceedings, which appeared to emanate from "*The Heart*" [of the Commonwealth] and reach and exhilarate the hearts of the large and respectable assemblage collected on this joyous and interesting occasion.—One of the Reports will be found in this week's paper.

HORSE CHESNUT.

MR FESSENDEN—You will allow me to add an appendix to your note upon Mr Jenkins's inquiry respecting the best method of cultivation of the horse chesnut.

For some years I took various means to obtain the vegetation of the nut, but without success.—The last parcel I planted without effect, I emptied on the grass until I was ready to institute some other scientific process. In planting them, I accidentally, and very fortunately left one. It was in leaf when I first discovered it. By a careful removal to a favorable soil it has become a fine bearing tree. All the rest perished as heretofore. Since this discovery I have not found the least difficulty. I endeavor to imitate nature in her planting the seeds of the forest.

Soon after the nuts are gathered, not allowing them to become dry, I make a slight excavation by the side of some bank, in my garden and spread them in, levelling them nearly with the surface. Care should be taken to lay the side from whence the root issues next to the earth.—This posture gives the root a more speedy access to nourishment, and facilitates the exit of the stem. I then cover them with leaves or some light rubbish, and replace as much earth as is necessary to keep the covering in place. By the time the ground is ready to receive them in the spring, I find them sprouted without the loss of one in a hundred. To disengage them from the earth, after removing the covering, I pass a stable fork under the mass, and gently pry them up, taking the out nuts singly and carefully, to prevent breaking the long tender root, and transplant them in trenches. In this process I make the holes with a trowel, deeper than the extent of the root. After partially filling them with light earth, I draw up the nut to within about an inch of the surface, leaving it just buried beneath it. I generally take them up the second year, and cut off the tap root, that they may be removed with more ease and safety when large enough to be transplanted from the nursery.

This tree is peculiar in its process, taxing the

patience of the cultivator in its early stages. The annual growth is finished about the last of June when other trees are in their most vigorous progress. In the three or four first years it rarely attains more than two or three feet in height. In the fifth season its stature is doubled. At this period it grows with the vigor and rapidity of other trees.

I have been more particular as your correspondent has not been fortunate enough to acquire any practical knowledge on this subject. From their incipient tardy growth, I trust he will not despair of seeing a nut planted by his own hand, become, in perfection, what he justly "esteems more than any other ornamental tree."

Respectfully your friend and serv't,
Worcester, Oct. 9, 1828. O. FISKE.

ERROR CORRECTED.

MR FESSENDEN—I observe in your paper of September 19, No. 9, page 70, you tell the public the Trustees of Mass. Society for the Promotion of Agriculture, had offered a premium of fifty dollars, for the best, and an effectual method of destroying the Locust Borer. You will perceive by the premium list published by Mr Russell, that the premium offered is ONE HUNDRED DOLLARS; and as your paper is considered good authority, (and deservedly so) will thank you to correct the error.

Respectfully your obedient servant,
GORHAM PARSONS.
Brighton, October, 9, 1828.

✍ We are much obliged to Mr PARSONS for pointing out the error specified above. It originated in our mistaking the premium offered for the best *Plantation of Locust Trees, &c.* which is *fifty dollars*, for that offered for a *mode of extirpating the worm* that attacks the Locust Tree, which is *one hundred dollars*.—EDITOR.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 17, 1828.

BRIGHTON CATTLE SHOW AND FAIR.

The annual exhibition of Cattle and Manufactures, &c. was holden at Brighton on the 15th inst. The day was cold beyond any recollected precedent, at this season of the year. The inclemency of the weather, however, did not prevent a numerous concourse from assembling, and was not sufficient to chill the ardor for improvement which animates our Cultivators, Manufacturers, Connoisseurs and Amateurs of useful arts and new inventions which promise to minister to the necessities, and add to the conveniences of mankind. We shall be able, at present, to give but brief notices of the memorable things which were exhibited, but must refer our readers to the Reports of the several Committees of the Mass. Ag. Soc.

The pens were 80 in number, and all filled with animals which may well be estimated as prime specimens of excellence, and respectively entitled to a standing at or near the head of their species.

THE PLOUGHING MATCH was ably contested by nine double and ten single teams. One eighth of an acre was staked out for each plough, and each lot was finished within 50 minutes, the time allotted by the Committee.

HORSES. Three English horses were exhibited, Barefoot, Serab, and the Cleaveland Bay.—

These were the highly valued gifts of Sir ISAAC COFFIN.

SWINE of superior shape, and perfect in all the points which indicate fine animals of that species were exhibited by S. Dudley of Sutton, J. Mackay, Boston, Jos. Barrett, Concord.

LIVE STOCK.—The exhibition in this department was superior to what we have ever before witnessed at Brighton. We observed in the pens about 20 head of stock of excellent quality exhibited, by JOHN L. BOYASTON, Esq. of Princeton.—One of his grass fed oxen not very fat weighed 2310 lbs. There were six pens filled with very fine animals, owned by J. Estabrook, Esq. of Athol. An ox, owned by Mr B. Harrington, weighed 2500 lbs. One sent by Mr S. Towne, of Charlton, weighed 2237 lbs. An uncommonly large one from Mr N. Slade, of Somerset. Several from J. W. Watson, of Princeton. J. Whiting of Princeton. S. Hastings, Princeton. B. Atwood, Barre. J. Robbins, Watertown. Fine Heifers from A. D. Williams, of Roxbury. Capt. D. Chandler, Lexington. A superior one from Z. Cook, Jr. Esq. Dorchester. B. P. Williams, Roxbury. A. Wyman, Roxbury. J. Goulding, of Sherburne. I. Farwell, Waltham. J. W. Goodrich, Roxbury. E. Sparhawk, of Brighton. Several fine animals from the stock of the Hon JOHN WELLES, Dorchester, added much to the interest of the Show.

SHEEP—A number of fine Merino Bucks and Ewes, from G M Barrett, Concord—Jas Barrett, Concord—R Rogers, Newbury—W Williams, Shrewsbury.

MANUFACTURES.—These were less extensive than they have been at former periods. The deficiency, however, was not in the excellence, but in the number of the articles. Several beautiful specimens of SILK, imported from Italy, (the same which have been left for inspection at the Farmer office) were exhibited and presented to the Society by J. M. GOURGAS—Cotton and linen Diaper and linen Sheeting by Mrs Hannah Ranger and Mrs. Hunter of New Brantree—linen diaper by a lady of Greenfield—a fancy straw bonnet by Elizabeth Bryant, Worcester—3 Turkey down tippets by Cynthia Thayer—Beautiful grass and straw bonnets and hats for ladies by Lydia T. Pone, Milford N. C. Atwood, Dighton, and Chastance Sanderson Shirley—specimens of linen thread, shoe thread, and cotton bagging, by the N. E. Manufacturing company at Grafton—2 beautiful bonnets made of the down of the milkweed—very fine woolen hose by Sophia Arms, Greenfield—several elegant rugs manufactured by John Doggett & Co. Boston—a rug by Jane Adams of Dorchester, aged 70 years. Bras and steel patent reeds for weavers, exhibited by Messrs. Wilkinsons of Providence.

In a pyramidal case were exhibited a great number of beautiful fabrics, too numerous to specify in this article. There were also some split sheep-skins by Uriah H. Boyden of Cambridge.

In another part of the Hall was a collection of black and blue Broadcloths and Cassimeres from Watertown, Dudley, and Northampton, which appeared quite equal to any imported. There were likewise carpetings, flannels, rose blankets, &c.

PREMIUMS.

Ploughing Match. The Committee on ploughs with two yoke of oxen, awarded the first premium of \$15 to Silas Dudley owner of the plough, himself ploughman, \$8, and W. B. Harrington, driver, \$4.

2d, Loring Smith, plough \$10, B. Seaver, ploughman, \$5, and L. Smith, driver, \$3.

3d, J. Dudley, plough \$6, himself ploughman, \$3, Arnold Allen, driver, 2.

The Committee on ploughs with one yoke reported that 10 ploughs started, and the work in general was very good. They awarded the first premium to Geo. M. Barrett, Concord, \$15, to the ploughman 8, and the driver 4.

2d, to Otis Merriam, Concord, a lad, \$10, himself as ploughman, 5, and as driver, 3.

3d, to Prescott Barrett, Concord, \$6, himself as ploughman, 3, and as driver, 2.

Fat cattle. First premium to B. Harrington, Princeton, fat ox, Holderness breed, weight 2560 pounds, \$25.

2d premium for fat ox, S. Towne, of Charlton, Holderness breed, weight 2237 lbs. \$20.

3d premium, N. Slade, Somerset, fat ox, weight 2315 pounds, \$10.

Bulls. First premium to Ichab. Stow, of Stow for a bull 2 years 6 months old, weight 1800 pounds, \$30.

2d, to L. Brigham, Cambridge, for a bull 2 yrs. 5 months old, \$20.

3d, to B. P. Williams, Roxbury, for a bull 13 months old, \$10.

Bull calves. First premium to B. Harrington, for calf of Holderness breed, 6 and a half months, \$15. 2d, J. L. Boylston, Princeton, 5 months \$15. 3d, N. D. Vose, Boston, \$5.

Milk cows. First premium to Wm. Osborn, jr. of Salem, \$30. 2d, to B. Harrington, Princeton, \$20. 3d, to J. L. Boylston, Princeton, \$15.

Heifers, having had calves. First premium to I. Robbins, Watertown, \$15. 2d, to John Goulding, Sherburne, \$10.

Young heifers. First premium to J. L. Boylston, \$12. 2d, Henry Craft, Newton, \$10. 3d, Daniel Chandler, Lexington, \$8. 4th, Zebedee Cook, jr. Dorchester \$6.

Sheep and Swine. The committee on Merino Sheep, and Swine, did not find any merino buck entitled to premium. They awarded the 2d to G. M. Barrett, Concord, \$10.

For Ewes, the 1st premium to Joseph Barrett, \$20.

For Swine, 1st premium to John Mackay, for best Boar \$12; and 2d to Silas Dudley S. First premium for best sow, to John Mackay \$12. 2d to G. M. Barrett, \$8.

Manufactures. First premium on Brandoths to S. ater & Howard, Dudley, \$20. 2d, to James M. Robbins, Watertown, \$15.

For Flannels, 1st premium to Mrs. Jonathan Wilcox, New Braintree, \$10. 2d, to Sally Bancroft, Pepperell, \$7.

Floor Carpeting, 1st premium to Zillah Davis, Holden, \$15. 2d, to Mary Barrett, Concord, \$7.

Stair Carpeting, 1st premium to Eunice Jaques Newbury, \$10. 2d, to Theresa H Thayer, Greenfield, \$7.

Blankets, 1st premium, to Mrs. James G Bryant, Oakham, \$6. 2d, to Eunice Jaques, Newbury, \$4.

Linen Sheetting, first premium, to Mrs J. Hunter, New Braintree, \$8—2d, to Mrs Job Ranger, New Braintree, \$4—Linen Diaper, 2nd premium, to Mrs Cynthia Thayer, Greenfield, \$3.

Several premiums were also awarded for rugs, lace, and needle work, and fancy articles.

Useful inventions. The Committee awarded to J. Mears, of Dorchester, for an improved Sausage

Filler, a premium of \$5—and for an improved mode of stacking Hay, another premium of \$5.—To George Coolidge of Watertown, a premium of \$12, for a rail-road and canal earth-cart.—A gratuity of \$12 was awarded to J. R. Newell, of Boston, for an improved Cider Mill.

The Committee on Working Cattle had not reported at the time the other premiums were declared.

The sentiments given at the Society's Dinner, and other proceedings, requiring further notice, are unavoidably deferred to our next.

The noble animal of the Holderness breed presented to the Massachusetts Agricultural Society, by the liberal Sir Isaac Coffin, was sometime since sold at auction by direction of the trustees, and purchased by Hon. John Welles of Boston. Mr Welles has recently presented the "Admiral" to the Worcester Agricultural Society. Soon after his arrival he was reported by Dr Fiske to have contracted the gout, from the hardness of the roads on his journey, and to be "sick a bed." By the great skill and care of the attending physician, he has become convalescent, and although not able to make his appearance at Cattle Show, is fast regaining health and weight.—*Worcester, Agis.*

The Thames tunnel is said to be entirely at a stand, little more than one tenth of the necessary sum having been subscribed.

Grape Vines.

The subscriber offers for sale Grape Vines of several varieties, the produce of his garden in Dorchester; among them are the following:

Isabella	White Muscat
Sweetwater	Black Hamburg
Black Cape	Elba
Queen	Muscatel
Early Oval	Alexander's or Schuykill

They are principally of one year's growth, planted under his direction and superintendence, are warranted genuine, and are in a healthy and vigorous state.

The subscriber proposes to continue the cultivation of such varieties of the foreign and native vines as are suited to this climate and that will thrive in the open ground in town or country.

Application may be made to the subscriber, at his office, No. 71-2 Congress Street, or at the Garden, to Patrick Kennedy, Boston, Oct. 3, 1829.

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be published to-morrow, the *New England Farmer's Almanack for 1829.* By Thomas G. Fessenden, Editor of the New England Farmer.—For sale, wholesale and retail, at the N. E. Farmer office, No. 52 North Market street, by Bowles & Dearborn, 50 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office.

Flower Seeds.

Just received at the New England Farmer Seed Store, No. 52 North Market Street.

A fine assortment of Flower Seeds, comprising all the most fashionable and splendid varieties, raised this season at Pepperell, Ms. expressly for this Establishment, neatly put up in small papers, 6 cts. per paper, \$5 per hundred, warranted; a liberal discount to traders.

Fruit Trees.

WM PRINCE, the Proprietor of the Linnaean Botanic Garden and Nurseries at Flushing, Long Island, has the pleasure of informing the public, that his Nursery now contains 172 varieties of the

Apple, 202 do. of the pear, 76 do. of Cherries, 139 do. of Plums, 23 do. of Apricots, 34 do. of Peaches, 29 do. of Nectarines, 10 do. of Almonds, 14 do. of Mulberries, 6 do. of Quinces, 16 do. of Figs, 16 do. of Currants, 15 do. of Raspberries, 47 do. of Gooseberries, 20 do. of Strawberries, 257 do. of Grapes, 600 do. of Ornamental Trees, &c. Above five hundred of the above kinds of Fruits are not to be found in any other collection in America. The different varieties cannot be otherwise than genuine, as the greatest attention is paid, and nearly all the kinds are inoculated from bearing trees. The Cherry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of J. R. Newell, at the Agricultural Warehouse No. 52 North Market-street, gratis; and orders left there, or sent by mail, will meet prompt attention. Oct. 3

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordeaux, Clerac, and Bazot, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1829.

Mr A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 100; and 18 cents for less than 50 roots.—Payment to be made on delivery of the roots.—Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 35 Wall street—Boston, E. Copeland, Jr.—Albany, R. M. Michael—Philadelphia, Van Amringe—Baltimore, W. H. Rhoads—Washington City, Wm. Pairo.—Richmond, Davenport, Allen & Co.—Savannah, Hall, Shapley & Tupper—New Orleans, Foster & Hutton—Charleston, (S. C.) J. & J. Street & Co. Mr A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal book sellers of the United States; and his agents will furnish them gratis to subscribers.

MISCELLANIES.

London gas and the Thames fishermen.—In consequence of successive complaints of the fishermen against the gas manufactories in London, it has been ascertained, that the trade of the former is completely ruined, by the destruction of the fish from the drain of the noxious matter from the gas works into the rivers. Before the pollution of the water, there were taken daily 3000 salmon, 50,000 smelts, and other fish in proportion. This season there has been only one solitary salmon caught in the Thames, and that down at Woolwich. Formerly, four hundred fishermen found support for their families in these fisheries. There are heavy penalties for discharging the refuse of gas into the river, which have in several cases been imposed. But as there appears to be no easier way of getting rid of the offensive matter, although the fish in the river will be entirely destroyed by it, it is supposed the gas companies will indemnify the fishermen, in some measure, for the loss of their business.—*N. Y. Statesman.*

A paper from Georgetown, D. C. says, "since the passage of the Canal bill, and the subsequent commencement of the great work, our town has been gradually increasing. Property has been greatly enhanced, and rents have advanced from twenty-five to fifty per cent."

Remarkable fact.—A gentleman of this village, planted an apple tree last spring which has blossomed four successive times, and produced two successive crops of fruit. The first blossoming was at the usual time, when the apple trees put forth in the spring but produced nothing. The second blossoming was about a month after the first, which we last week saw upon the tree. The third blossoming was about a month after the second, and also produced fruit, which is now on the tree. The fourth blossoming was last week, and we saw fresh blossoms on the tree on Thursday last, which promise fruit, unless the buds be nipped by the frost. The apples from the second blossoms are about the size of a small walnut and are not ripe. The third crop are smaller and somewhat shrivelled. The trunk of the tree is straight and small, being about an inch and a half through, a foot from the ground, and is about twelve feet high. It stands on the side of a hill, with a southern exposure. The fruit and blossoms come from a single stock, no scions or buds having been inserted in the tree. We have heard of trees putting forth two sets of blossoms, but never four successive blossomings, two of which produced fruit. Phenomena of this kind are frailties of nature, and to be accounted for, probably, on the supposition of an irregular, or diseased action of the juices of the tree.—*Lions (N. Y.) Ad.*

To kill Moles and Mice.—Take one fourth of a pound of maize, one ounce verdigris, 3 ounces of quicklime, 12 crayfish, a quarter of a pound of lavender; pound and mix all well together into a paste, to which add a little river water; make up pills about the size of a nut, and lay them in the way of the moles and mice.

Mortar improved by a mixture of Potatoes.—It is stated in the Bull. Univ. that M. Cadet-de-Vaux has found mortar, of lime and sand, and also that made from clay, greatly improved in durability by a mixture of boiled potatoes.

Fool-rot.—This terrible disease has made its appearance in several parts of the State, and has ruined some of the finest flocks. Its origin has been traced in nearly all cases, to imported Saxony sheep. It is of the greatest importance to farmers interested in this branch of husbandry, to be vigilant in checking the progress of this disease. We advise those whose flocks are healthy, to beware of buying or mixing with their sheep, those that they are not certain are equally sound; as when it is once introduced into a flock, there is little hope of their escaping its ravages. It is said the diseased should be separated from the sound, the moment they are discovered to be infected.—*Vermont paper.*

Damaged hay.—In the year 1789, which, like the present year, was remarkable for the quantity of rain which fell during the hay season, the farmers suffered great loss from the thousands of heads of cattle which perished from eating damp hay. This fact ought to put farmers on the guard against any similar effects at the present time.—The efficacy of salt in curing hay is now almost universally known: but the best advice, perhaps, which can be given, is to be careful as to the quantity which is given.

Floating lids are recommended by a German economist, (M. Franzins,) to be employed in the case of common beer barrels; since, by sinking, as the liquor is drawn off, they will preserve the beer as effectually as if the cask were constantly full.

Disley twins.—On the 20th of July, 1828, Mr. Lemuel Hayward, of Pomfret, Conn. killed a pair of three quarter Disley twin lambs, which were yeaned February 10th, 1828; the carcass of one weighed forty-six pounds, and that of the other forty-nine pounds. They belonged to a flock which had received no extra keeping. He killed several pairs of twins, which weighed nearly as much as the above.—*Communicated.*

Raspberry wine.—If an attempt be made to form wine from raspberries and sugar, a liquor will be produced with but little if any of the flavor of the fruit; but a small quantity of juice of raspberries added at the decline of the fermentation, or a little fresh fruit suspended in the cask at the same period, will be sufficient to communicate an excellent raspberry flavor.

Traps for mice.—One of the best traps for mice is an empty flower-pot buried in the soil, with the bottom level with the surface.—*Gard. Mag.*

A farmer in South Carolina, during the last year, sold Wine to the amount of two thousand four hundred dollars, the produce from four acres of land.

A grocer in London, (Robinson) has obtained a patent for preparing barley in the manner of ground rice, and we believe it is very generally used in hospitals, and as food for children.

Order is Heaven's first law. Do every thing at the proper time—keep every thing in its proper place—use every thing for its proper purpose, and never think any part of your business too trifling to be well done.

The plough has been used for excavating a water-course, for the use of the Salt-works of Friederichshall, in Wurtemberg, drawn by eight horses. It was found to do the work of 1,500 men, and to produce a saving of 32,000 days' work. The water course extended several miles.

Wilson's Nursery, Derry, N. H.

The proprietors inform the public that their nursery offers peculiar facility for the acquirement of useful fruit; more than fifty thousand trees now cultivated by them consist of a great variety of Apples, Peaches, Plums, Cherries, Quinces, &c. embracing most of the celebrated and esteemed kinds in this country. The utmost care has been observed by the original proprietor for more than thirty years, in making the selection and the whole is now offered as containing none but the most worthy of cultivation. Persons not acquainted with the different kinds by name, who wish to procure choice kinds, by stating the time they wish them to ripen, may confidently trust to the proprietors without fear of disappointment. All orders will be promptly attended to, and trees furnished at their nursery, this fall or next spring, at the following prices.

Apples, per hundred,	\$16
Peaches do	16
Plums do	25
Cherries do	25
Quinces do	\$16 and 25
Horse-chestnuts	25
Oct 3 61	JOHN A & SAMUEL WILSON.

FRESH SEEDS AND ROOTS.

Just received at the New England Farmer Seed Store, No 52 North Market Street.

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the *Rheum Undulatum*, or Tart Rhubarb, or Pie-Plant, an excellent article for summer use.—(See N. E. Farmer, vol. vi. page 290, and page 11 of this volume, and Fessenden's New American Gardener, article *Rhubarb*, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts per root.

Potato and Tree Onions.

Also, a supply of Potato and Tree Onions. The Potato Onion has proved a fine acquisition to the list of vegetables raised in this country, and is getting into general use in the Middle States. They have produced 12 and even 20 fold in this vicinity the past season; come much earlier than the common, are milder, and more sure of producing a crop. Price 6 cents each, 50 cts. per dozen.

Indian Corn.

Several varieties of Field Corn, selected with great care, for its earliness and productive quality—also Early Sweet and the Early Jefferson Corn, for the table.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. will be published in the course of a fortnight, and forwarded gratis to any one who will send for it.

Splendid Bulbous Roots.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, direct from Van Eden & Co. Harlem, Holland, a large assortment of Bulbous Flower Roots, comprising the finest varieties of

HYACINTHS—(double and single,) dark blue, porcelain blue, red and rosy coloured, pure white, white with yellow eye, white with rosy eye, and yellow with various eyes: from 25 cts. to \$1.00 each.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots, 33 cts. each.

JONQUILLES—sweet scented, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 33 cts. each.

DOUBLE NARCISSUS—fragrant, of all colors, 19 cts. each.

SPRING CROCUS—of all colors, 6 cts. each, 50 cts. per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 2-1/2 in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the more refuse of the most inferior collections, and roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

Also, a further supply of Bulbous Roots, comprising Martagon and Tiger (spotted) Lilies—Low priced Hyacinths and Tulips, 12 cts. each—Common Tulips at \$6 per hundred roots, raised in this vicinity. Their low price makes them an object to those who wish to form a handsome Tulip Bed.—Large White Lilies, 25 cts. per root.—Large Daffodils 12 cts. each.

A further supply of Lilies, Persian Fritillaries, Iris, Ixias, Paeonies, Amaryllis, Star of Bethlehem, &c. is daily expected. All orders faithfully executed.

NEW ENGLAND FARMER.

*The Committee consisting of E. H. DERBY, Deacon
ELIJAH COREY, and ELIJAH PERRY Esqrs.
on the Ploughing Match, with one yoke of oxen:
Report—*

There were twelve entries for ploughing, and only ten lots of ground; your Committee regret

being obliged to exclude two of the competitors Mr. Barrett, and Mr. Merriam, of Concord.

The ploughs all but two were of the improved kind with cast iron mould boards, and the ploughing generally met the approbation of the judges. They award the premiums as follows:

1st to Geo. M. Barrett, of Concord,	\$15 00
the ploughman,	8 00
the driver,	4 00
	\$27 00

2d to Otis Merriam, of Concord (a lad)	\$10 00
same as ploughman,	5 00
same as driver,	3 00
	\$18 00

3d to Prescott Barrett, of Concord,	\$6 00
same as ploughman,	3 00
same as driver,	2 00
	\$11 00

E. H. DERBY,—Per Order.

*The Committee on the Ploughing Match with two yoke of oxen, REPORT—*That out of twelve teams that were entered, nine appeared on the ground, and took their stations according to their entries, as follows.

- No. 12 Silas Dudley, of Sutton,
- " 13 Joseph Dudley do.
- " 14 Luther Whiting do.
- " 15 Sherman Barrett, of Concord,
- " 16 John L. Boylston, of Princeton,
- " 17 Luke Fiske, of Waltham,
- " 18 Joseph Dakin, of Mansfield,
- " 19 Perley Tapley, of Danvers,
- " 20 Loring Smith, do.

The ground allotted was on the side of a hill, very hard, and many rocks and trees in it. The lots contained one eighth of an acre each. The ploughmen were directed to use great pains, as goodness of work, would be the criterion in deciding, and ample time was allowed for the task.—The ploughmen showed much skill, and the cattle were generally very fine. Among so much good work (considering the nature of the soil) they found some difficulty in deciding on the second and third premiums—but have been unanimous in their decisions, and award the

1st premium to Silas Dudley	\$15
to do. as ploughman	8
W. B. Harrington, driver	4—27
2d premium Loring Smith,	10
B. Seaver, ploughman,	5
Z. Smith, driver,	3—18
3d premium Joseph Dudley,	6
do. ploughman,	3
A. Allen, driver,	2—11
	\$56

The Committee were pleased to see that two thirds of the ploughs were of the improved *Cast Iron*, which they are fully convinced are the most economical for the farmer, and of easier draught for the cattle. For the great improvement in this

plough (which is the most important implement in agriculture) and the introduction of cast iron ones, the American farmers are indebted to the *Ploughing Matches*: and which were first introduced in America by the Massachusetts Society for Promoting Agriculture. They much regretted that the lots were of so small a size.

JOHN PRINCE,
EBEN. HEATH,
JOSEPH CURTIS. } Committee

Brighton, Oct. 15, 1828.

The Committee on Agricultural Inventions report as follows:

JOHN MEARS of Dorchester produced the model of a roof for the better securing hay in stack: it consists of a kind of rough or shed roof, made of joist six or eight feet apart, and covered with boards lapping about three inches, and nailed securely to the joist, the edges of the boards nailed and drawn close so as to keep out the water of factually; the width and length of roof as may be most convenient. The roof is attached to the barn, or any suitable building, by three hinges on the ends of the joist, which fasten to a small timber or large joist, attached to the building horizontally; a post is placed at each of the front corners of the roof, and by ropes passing over shieves or pulleys through a mortice in the tops of the posts, is hoisted or lowered as occasion requires. Hay may be defended from the weather much better by this apparatus, than by the ordinary mode of stacking; it can be moved or stacked more expeditiously, and removed in part at different times, without leaving what remains exposed to the weather; it is not costly, and will form a useful shelter in summer, when not wanted for hay, for carts, ploughs, and many implements of husbandry, which are too frequently exposed to rains and a hot sun. Mr Mears produced certificates of its utility the present season from farmers in his neighborhood. For the invention the Committee award Mr Mears a premium of five dollars.

JOHN HORTON, of Lynn, presented for premium an apparatus for destroying grubs as they ascend apple trees. It consists of a trough formed of coarse paste board covered with canvass, the whole coated with a resinous substance or cement, this trough is formed into a circle to surround the tree, any irregular space between the tree and side of the trough, being filled with tow or other soft material, the trough is then to be filled with oil, the rain is kept from the oil by a roof formed of the same materials as the trough, and covered with the same composition, the roof is in shape of a common lamp shade, and is placed round the tree a few inches above the trough, where the whole is carefully placed, it must be an effectual method for preventing the ascent of the grubs, but too complicate to be made by every farmer, from description, and perhaps too expensive. The Committee consider its effect so certain, that they recommend it for a few valuable trees in a garden, or near the house, when there may be doubts of the end being attained by any of the other modes in practice. The Committee hope its utility will be further tested, but do not

award a premium.

JOHN MEARS, of Roxbury, presented for premium, a machine for filling sausages, with which the labor is performed with more ease, and more expeditiously, than by any machine for that purpose now in use. The meat is put into a tin tube about four inches diameter, and six or eight inches long, forming a cylinder, to the bottom of which a tin is soldered, forming a tunnel, the lower end of a size to receive the sausage case, the meat is discharged into the sausage case, by a piston, which is moved by a rack and pinion of cast iron. By means of this apparatus, from one pound and an eighth, to one pound and an half have been filled in one minute. Mr Mears produced certificates of its performance, and the Committee considering it a neat and useful machine, award a premium of five dollars.

JOSEPH R. NEWELL presented for premium a Grater Cider Mill, which he introduced from Troy, State of New York, where it was invented and the patent right secured. Mr Newell has purchased the right to make and vend for several counties in this state. It has a wooden cylinder upon the surface of which nails are fixed, the heads sharp upon the edges, and project above the cylinder about one eighth of an inch. The apples are filled into a hopper placed over the cylinder, and led into a narrow cavity at the upper side of it. The cylinder is mounted on a high frame, its axis being placed in composition boxes, a rapid revolution is produced by connecting it with a horse mill by belts or bands, the apples are reduced to a fine pumice, grated, not pressed. It performed well in presence of the Committee, and grated a barrel of Russet apples, in one minute thirty-four seconds. Certificates were produced signed by respectable persons in this State, some in this neighborhood, and from persons in New York and New Jersey, all recommending this mill in very strong terms, some certified that seven bushels of apples usually produced a barrel of cider when grated in this mill, and that the quality of the cider was such as to bring, in the New York market, four shillings per barrel more, than cider from apples ground in the common mills.—To Mr Newell the Committee award a gratuity of twelve dollars.

GEORGE COOLIDGE, of Watertown produced a rail road, and canal Earth Cart, invented by him and now in use at Lowell: it was also used last summer in making a road in East Sudbury, one man with the Cart excavated and removed on an average, ten square or four hundred thirty-two cubic feet of earth per day. At Lowell the Carts are moved by horse power; and in digging a canal, one horse in eleven hours removed ten squares of earth two hundred and sixteen feet to the square, carrying the earth one hundred rods—at the same place three horses in one day removed thirty squares measuring six thousand four hundred and eighty feet—or three hundred and fifty tons; for the same work, at the same place, it required twenty-four yoke of oxen and twelve drivers. Mr Coolidge uses a temporary rail-way, as he terms it, made of pine or spruce plank 2 inches thick, and in his written statement says one man with his cart can remove more earth in one day, than a man with a cart and four oxen can drive twenty rods and discharge in the same time. The body of the cart examined by the Committee will hold ten or twelve cubic feet; it is formed under the axle, and the bottom opens to discharge the

load. To Mr Coolidge the Committee award twelve dollars.

Mr Jos. POPE brought his machine for threshing grain, and for which he obtained the Society's premium several years since when worked by hand. Mr Pope's object was to show the Committee with what ease and advantage it could be worked by horse power; and for which purpose he attached a belt or band from a horse power mill, which Mr Newell had put up in the cellar of the stall for his Grater Cider Mill. The machine moved with great rapidity and with perfect ease to the horse. Mr Pope fed the machine with rice straw, and it thrashed it with very great despatch and perfectly clean, every kernel free from stems and foot-stalks. The Committee think Mr Pope's machine well calculated for threshing rice, so far as they could judge from this trial of a small quantity. They were pleased with Mr Newell's horse power mill, which is very convenient, not taking so much room as those in general use, and far better than any that either of the Committee have seen in operation.

JOSEPH R. NEWELL entered for premium a revolving Horse Rake, and produced certificates of its usefulness in other States. But as some have been in operation in Massachusetts, and no certificate produced of the manner in which they performed the work, the Committee could not award a gratuity.

Mr Newell placed in the Hall for public examination, Thomas' Hand Garden Winnowing Mill for cleaning garden seeds, a lot of japanned wooden Ware, American manufacture—a Fork from Mr Grieve of West Newbury, for digging or turning heavy hard soil, an improved and convenient Hand or Counter Scale for weighing, all which he keeps for sale, with most of the approved agricultural implements, at his store in Boston.

GORHAM PARSONS,
DANIEL TREADWELL,
DAVID MOODY,

} Committee.

Brighton, Oct. 15, 1828.

The Committee on Fat cattle, Bulls, and bull Calves
REPORT as follows, viz.

To Benjamin Harrington, of Princeton, for his Ox, weight, 2,500 lbs. they award the first premium - - - \$25 00
To Gen. Salem Towne, for his Ox, weight 2,237 pounds, from imported bull Holderness, they award the second premium 20 00
To Nathan Slade, of Somerset, for his Ox, weight 2,315 pounds, they award the third premium. - - - 10 00
To Ichabod Stow, of Stow, for his Bull, two years and six months old, weight 1,800 pounds, they award the first premium 30 00
To Lincoln Brigham, of Cambridge, for his Bull, weight 1,176 lbs. they award the second premium - - - 20 00
To B. P. Williams, of Roxbury, for his Bull, thirteen months and ten days old, from an improved cow, by imported bull Admiral, weighed, on the 6th of Sept. 657 pounds—on the 14th October 845—in thirty-eight days increased 188 pounds, they award the third premium - - 10 00
To Benjamin Harrington, of Princeton, for his Bull Calf, six and a half months old, of the Holderness breed, they award the first premium - - - 15 00
To John L. Boylston, of Princeton, for his

Bull Calf five months old, dam from Denton, they award the second premium - 15 00
To Nath'l. B. Vose, of Boston, for his Bull Calf, five months old, they award the third premium - - - 5 00

Mr Sam'l. Sweetser, of Athol, county of Worcester, entered a very fine Ox, fattened on hay and grass, with a few potatoes in winter; he was not large, but very fat—was considered a profitable animal for slaughter, and fattened at a very moderate expense. He would have received a premium, but having been purchased by Mr. Winchester, (one of the Committee,) previous to the show, he insisted from motives of delicacy, that a premium should not be awarded Mr. Sweetser; observing it was worth the premium to exhibit an ox so handsomely and economically fattened.

The Committee could not but observe with pleasure, the six pens filled with fine cattle, by J. Estabrook, Esq. of Athol. Mr. Boylston's milch cows and fat cattle, and many others which could not fail to show a great improvement in neat stock. The Committee are fully satisfied the pens were filled with as many, and certainly as good cattle as at any exhibition since the commencement of cattle shows at Brighton.

GORHAM PARSONS,
TIMOTHY WALKER,
EDMUND WINCHESTER,

} Committee.

Brighton, Oct. 15th, 1828.

The Committee on Agricultural Experiments, to whom the inspection of Butter, Cheese, and Cider exhibited for premium, was also committed, REPORT

That fifteen parcels of butter were entered on the books of the Secretary of the Show, for premium; of these, eleven parcels containing from 3 to 400 pounds each, were exhibited for the premium of \$100, which the Trustees of the Society were enabled, by the subscriptions of a number of respectable citizens of Boston, and its vicinity, to offer to farmers residing within the New England States, in order to encourage improvement in the quality of butter brought for sale to the Boston market. The most part of the butter exhibited, was well made, of a good flavor, and evidenced unusual attention, both in the manufacturing, and packing of it. The Committee award said premium of \$100 to Mr. John L. Boylston, of Princeton, in the county of Worcester. This butter is packed in 8 new firkins, made of hard wood, containing about 50 lbs. each. In colour, taste, absence of buttermilk, and of all foreign aids, it may be pronounced to be equal to the best imported, and much famed Irish butter.

The Committee award the Society's premium of \$15 for the best 50 lbs. of butter in boxes to Mr Michael Crosby, of Bedford. For the next best, \$10 to Mr Luther Chamberlain, of Westborough. This butter is of an excellent quality, and flavor, not being packed according to the views of the gentlemen offering the premium of \$100, but in small jars, proper only for the retail market; and being offered for that premium, and also for the Society's premium, which of itself required 50 lbs. The quantity exhibited was not sufficient to entitle Mr. Chamberlain to the first premium, had all other circumstances have been favorable. For the next best butter, the premium of \$7 is awarded to Mr Jonathan Wait, of Whately, in the county of Franklin.

Six parcels of cheese, not less than one year old—and sixteen parcels of cheese, of the present

year, were exhibited for the Society's premiums. The Committee award the premium of \$10 to Mr. Danforth K. Tufts, for the best new cheese. For the next best, \$5, to Mr. Samuel S. Woods. For the best old cheese, the premium of \$10, to Mr. Elisha Mathews. For the next best, \$5, to Mr. Daniel Hunter, all of New Braintree, in the county of Worcester.

Three barrels of cider were exhibited for premium; the Committee are of opinion that neither of the casks is of a sufficiently good quality to be entitled to either of the premiums offered by the Society. That exhibited by Mr. John Perry, is the best, and the Committee recommended a gratuity of \$10, to be paid to him. This cider was made in the year 1826.

Mr. Ebenezer Withington, of Dorchester, and Mr. Simeon Greene, of Mansfield, exhibited, each of them, a hive filled with excellent honey. Mr. William Kenrick, of Newton, and Mr. Samuel Wait, of Malden, exhibited samples of currant wine; no premiums were offered the present year by the Trustees, for either of these articles.

Mr. John Webber, of Beverly, exhibited a quantity of his excellent mustard, well packed in tin cases; for which he found a most ready sale.

To Mr. Jeremiaah Crosby, of Billerica, the Committee award the premium of \$50 for the best apple orchard—this premium is awarded on the report and recommendation of a Committee of the Trustees; of which the Hon. John Lowell was chairman, who visited Mr. Crosby's orchard a few days since.

The Committee award to Mr. Samuel Chamberlain, the premium of \$20 for the greatest quantity of butter, and cheese, made on his farm, between the 1st day of June, and the 1st day of October, being 4,150 pounds of new milk cheese, 1,700 pounds of skim milk cheese and 800 pounds of butter. Mr. Chamberlain states, that for two weeks of the time abovementioned, he made 150 pounds of butter per week from twenty cows; and that for several days he made from twenty-two cows, 64 pounds of new milk cheese each day.

All which is respectfully submitted.

THOMAS L. WINTHROP,
BENJAMIN GUILD,
JOHN C. GRAY,
EDMUND T. HASTINGS.

Bristol, Oct. 15, 1828.

Passages from various writers relative to the Scotch Threshing Machine.

Mr. Arthur Young of England has the following passages about Threshing Machines.

"The farmer may lose immensely, if his straw be not threshed clean; and as it is a work generally performed by measure, the men are too apt to turn it over too quickly, and to thresh out only that corn which comes the easiest from the ear.—In respect to *pilfering*, the work gives them greater opportunities for it than any other!"

"The expense of a *fixed* mill is from 60 to 100 guineas, for one that requires 2 or 3 horses. It will thresh out about 15 quarters of wheat (about 117 bushels) in 8 or 9 hours; and from 15 to 20 of barley, oats, peas or beans. Barley is the grain that thrashes worse with them, than any other;—but I have seen several that thrash it as other grain; Such as Mr. Ashley's. His price for a *fixed* one is 75 guineas; and for a *moveable* one 120. The granary should always be over the fixed mill;

that the corn may be drawn up at once, and lodged safe under the farmer's key.

"Such mills as are here described, have been greatly multiplied; but at present (1814.) it is admitted by all the best *judges*, by those who have had the greatest *experience* that *these small and cheap machines* are deficient in strength and duration: None should be worked by fewer than 4 or 6 horses or oxen. The regularity of the movement of oxen has been found much superior to that of horses; and the strength of the machine in all its parts (should be) proportioned to that of the team. Upon this plan the expense cannot be less than \$160. I have thrashed two crops by *moveable machines*, paying 1s. 2d. per quarter for wheat, for the mere threshing; but it answered merely in cleanness of work and in the prevention of pilfering. When the expense of the 4 horses, the labor, (for one man only comes with the machine,) and the dressing were added, the work cost me as much as if done by hand."—Thus far this Extract from Mr. Young.

In Mr. Young's catalogue of Farming Implements, at the end of his Farmer's Calendar, we have the following prices given, on the plan of securing *solidity and durability*.

Ashley's threshing machine, fixed £105.—do. for 4 or 6 horses £300.—Perkin's improved threshing machine, [apparently a hand machine] £30.

The immense superiority of Mr Pope's threshing machine over the above named, as to *cheapness* in the original price; and its greater excellence in the mode of operating, certainly speak much in its favor. The addition of the *patent profit*, which all just men must admit to be reasonable, since many patents fail in their intent, and the right to others is contested, independent of the charges incurred by bringing a machine to perfection, the addition of this profit, we say, leaves Pope's machine as most remarkably cheap, particularly when its excellence is considered.

The annual meeting of the Hartford County Agricultural Society was held at Hartford on the 15th inst. The Mirror observes that "so great a concourse of people, we believe, never thronged our streets on any former, similar occasion; and we are certain that no similar festival ever produced a more decided expression of interest and approbation.

"The stock exhibition at the cattle show, afforded an unusually rich treat to those who take an interest in the improvement of the breeds of domestic animals. But we must be permitted to say, that in our view, sufficient encouragement is not offered by the Society for improvement in the breed of horses.

"The long team, as it is called, and for which the Society is indebted to Mr. Aaron Goodman, and others of West Hartford, increased materially the interest of the day. But it was not its length merely, which gave it attraction, the cattle were very beautiful, and well matched, and the fact that they were taken promiscuously from the farmer's yards, furnishes another and important testimonial, to the utility of agricultural exhibitions. In short, to the friends of the Hartford County Agricultural Society, the character of their late celebration speaks a language not to be misunderstood. It tells of a spirit of improvement (traceable to their benevolent efforts) which will be immeasurably important in its results. To the present patrons of the Society, it offers powerful in-

centives to perseverance. To the slothful and indifferent, to whom God has given the means of converting the barren wilderness into a fruitful field, it carries a lesson of striking admonition.

"Among the strangers of distinction who honored the Society with their presence, was the governor, and lieutenant governor, and adjutant general of the State. Gov. Tomlinson, (like his distinguished cotemporary of Massachusetts) is a distinguished agriculturist, and his prepossessions are in favor of upright and intelligent farmers—men who in their duty towards God, obey his commandments, and in the discharge of their obligations to their country, 'make two blades of grass grow where but one grew before.'"

The report of the Committee on domestic manufactures states that "the exhibition of woollen cloths was more extensive than last year"—that they "had the pleasure of inspecting an excellent assortment of carpeting from the Tarrillville manufactory, equal in every respect to the best imported." Among the persons entitled to premiums were Cyrus Butler, of Hartford, for a handsome mahogany work-table, made during his leisure hours. He had worked at the trade only one year. Miss Bruce, of Hartford, for a mattress filled with husks. Elizabeth Burrett, of Berlin, for a quantity of sewing silk. O. B. Freeman, of Canton, for Palmetto hats.

Notice is also taken of a letter from ex-president Monroe, with a splendid ring sent by him to Miss Susan H. Hubbard, of Simsbury, in return for an excellent plaid cloak. A very ingenious patent self-sharpening plough, by Nelson Pitkin, of Manchester. A plough and cultivator, from Philadelphia, by Solomon Porter, Esq. An elegant sofa with spring seats, by Watrous & Dickinson. A superb coffee urn, from T. D. & S. Boardman. Three clusters of the white Madeira grape of large size and delicious flavor, pronounced by good judges, equal to those from any country, from James B. Shults, &c. &c.

The Committee of Inspection reported, in substance, that the collection of domestic animals exceeded in number, and surpassed in excellence those produced at any former exhibition of the Society. The bulls offered for premiums, have been all derived from foreign breeds, recently imported, and many of them very fine animals.—They express regret that more attention has not been paid to the native breed of cattle, for which the county has been justly celebrated. They speak highly of the milk cows, working oxen, steers, and heifers exhibited; and say "for many years past, the breeding of horses has been greatly neglected by the farmers of this county. The number and generally good appearance of the breeding mares and colts exhibited this year justifies the expectation that more attention will in future be paid to this object. The few sheep and swine that were exhibited were of the very best specimens." They speak in terms of commendation of the well known horse Highlander, his descendant, the Dey of Algiers, a fine horse exhibited by Mr. Sacket, of Sandisfield, Mass.—and a two year old colt owned by Mr. Wilcox, of Canton. The bulls, Wye-comet, Holderness, and Holkham, the last of the Devonshire breed of cattle, are spoken of in terms of approbation.

The report of the Committee for viewing farms appears to be very long, and its publication, commenced in the last Mirror, is not completed. We hope to give the substance if not the whole of this hereafter.

EXTRACTS

From an "ADDRESS" delivered before the Rhode Island Society for the Encouragement of Domestic Industry. By JOSEPH L. TILLINGHUST.

There is no truth more satisfactorily established than that every scheme of tillage, to be successful, must be calculated for a *course* of years, not for a single year. Every farm, therefore, which is not to be cultivated by the proprietor, should be let upon a long lease, with provisions as to rents and renewals at stated periods, coinciding with the increasing value. The adoption of such leases was the first step taken by the English and Scotch proprietors in their signal march of improvement. Every farm let yearly, to successive tenants, is abandoned to inevitable depreciation. No plan is followed out, and each new tenant, like the philosophers swarm of flies, comes more hungry than the last, to exhaust the heart of his victim.

It is also a truth that the first fruits of capital derived from culture should be re-absorbed in culture, and are more profitably invested in the *same* than in *additional* acres. The ambition of adding farm to farm, and owning all the adjoining lands, has made many a poor and embarrassed large land-holder who might have been the opulent light-hearted lord of his first small territory. While you have a new field unsubdued, an old one unbroken, a bush pasture uncleared, a wet meadow undrained, a water-course unappropriated, waste that should be plantation or arable, arable that should be orchard and fruit garden, sand unconverted into loam, gravel that requires clay, or a square foot of either on which you return less in manure than you take in crop; while your sheep look for the turnip patches and cannot find them; your cattle smell for the clover, rye grass, and sanfoin, and cannot find them—your workmen search for the improved presses, ploughs and harrows, the scarifiers, rollers and drills, and cannot find them. So long as your barn-yard is too wet or cold, or your barn wants size and ventilation—so long as your fences let in the unruly animal, and the more vexatious quarrel, be assured that you have claims upon your capital and scope for its most useful employment at home.

Good enclosures must precede tillage; perhaps the best for us is the stone wall. The beauty, the fragrance, and the perfect fence of the thorn hedge, are purchased by twelve years of care and expense upon the growth, and continual diligence in clearing and cutting. After enclosure, and shelter, the operations of tillage, seem to proceed upon three simple principles. The soil is to be made dry, and kept clean, and rich. Lands, by nature too wet and seemingly condemned by that circumstance to perpetual sterility, become the most fertile when properly dried by art; the operation of which must often be carried into the subsoil. If the superfluous moisture is but temporary, it must yet be removed before ploughing. So said Columella, Palladius, and Pliny, of old—and experience justifies the precept. By rendering the soil dry, it is made susceptible of all the benefits which water, descending in the shower or turned on in the flowing stream, can impart. Water *percolating* the porous soil in summer is its bread of life, spread over its nakedness in winter, is its protecting raiment; but encompassing it with a cold clinging embrace throughout the year, is *deadly suffocation*.

The importance of a control over water courses

for the purpose of tillage seems but lately to have become an object of much interest in this State. Its rising consequence was announced by that clamorous, but faithful chronicler of the feelings and pursuits of the times, a law suit.

Many of our most favorable situations for high culture might be improved by a provision to withhold or impart moisture. The remark suggests to my mind that delightful settlement in the vicinity of Greenwich, named from the French Protestants who fled from the face of Louis XIV. and here planted another city of refuge, another memorial of persecution. It is refreshing to the eye, and to the spirit, to look upon that valley in the verdure and loveliness of its summer countenance especially when in a dry season, it seems a green Oasis amidst a parched and burning region. But this dry season seems necessary for its greatest fertility. It suffers in the wet. Should each proprietor run a trench across that portion of his farm, which begins to ascend the highland, the too abundant moisture would thus be retained from the whole circumstanced basin below, and might yet be imparted to it at pleasure. The strata through which water, collected in the higher regions, passes down from the summits and sides of hills, have been exemplified by thrusting a blunt instrument upwards through several folds of paper, by which the undermost fold is made to appear above the surrounding edges of the other broken folds, and becomes the summit. Between each successive layer, thus formed, water will enter and descend, and if received in a trough running round the bottom, may be conducted whither you will.

When the proprietor has not the command of the sources of the water he must sink the drain in the low wet soil.

The subject of draining is a science by itself—volumes have been written on the modes of forming these subterranean conductors, as essential to some soils as arteries and veins to the animal frame. The stone drain is the most durable, but when once obstructed the earth consolidates about the stones, and their hardness and immobility are then a disadvantage. Wood and brush, with straw, make larger cavities and as the wood gradually perishes the ducts are enlarged or new ones formed for filtration. The cheap mode practised with the aid of the draining wheel, which will effectually trench twelve acres in a day, is worth attention. That simplest of all draining, the single deep furrow of the plough, with the sod pared upon the inner side and restored to its natural situation, is in the power of every husbandman.

From London's Gardener's Magazine, [London] for Aug. 1828, just received at the N. E. Farmer office.

On the Horticulture of the United States of America.

By JESSE BUEL, Esq. C. M. H. S.

Horticulture received but little attention in the United States, until quite a recent period; and, with occasional exceptions, was limited to the culture of common culinary vegetables and fruit. A young people must earn the means of procuring the luxuries and elegancies of horticultural refinement, before they can enjoy them. The wants and necessities of a new country are generally too imperious to leave much time, or to afford adequate means, for indulging extensively in the ornamental and scientific departments of gardening; and perhaps the republican principles of the gov-

ernment, and the habits of the people, have in a measure tended to retard improvement in these higher branches. Most men are ambitious of popular favor; and here, where all are upon a political equality, whatever savors of singular ostentation or extravagance rather begets bad than good feelings. The Tartar conquerors conciliated the Chinese, by conforming to the laws and customs of those whom they had conquered. But the greatest obstacle to improvement has been the want of prominent examples. There have been no royal gardens, no horticultural gardens, no botanical gardens (but in name), no public gardens, to stimulate and instruct those who might wish to cultivate taste, or acquire knowledge, in this branch of rural improvement. Respectable private gardens were occasionally found in the neighborhood of large towns; but their number was too small, and the access to them too limited, to produce much influence towards general improvement. Four or five public nurseries are all that are recollected of any note, which existed in the States in 1810, and these were by no means profitable establishments.

About the year 1815, a spirit of improvement in horticulture, as well as agriculture, began to pervade the country, and the sphere of its influence has been enlarging, and the force of example increasing, down to the present time. This spirit has been fostered and greatly increased, by valuable periodical publications devoted to these branches of industry, by the munificence of State governments, by numerous associations of practical and scientific individuals, and by the example and publications of Great Britain; and among the latter, Sir, your Encyclopedias and Magazine have been particularly beneficial. And we have an assurance, in the skill, perseverance, and vigor, with which our people are pushing improvements in navigation, in the facilities of internal commerce, in manufactures, and in other branches of labor, that ornamental gardening will neither retrograde nor remain stationary.

Our nursery establishments are increasing in number, respectability, and patronage. Selections of native fruits are made with better judgment and more care than they formerly were. Most of the esteemed European varieties have been added to our catalogues. The cultivation of indigenous forest trees and shrubs, esteemed for utility or as ornamental, has been extending; and the study of botany is becoming more general, as well for practical uses, as on account of the high intellectual gratification which it affords to the man of leisure or of opulence.

My personal acquaintance with American nurseries does not enable me to describe them particularly. I shall, therefore, barely enumerate the most distinguished, with the view of affording to your readers useful memoranda, in the event of their wishing to procure American trees, plants, or seeds.

The *Linnaean Garden*, at Flushing, is the oldest, and probably the most extensive, nursery establishment in America. This nursery has been already noticed in your Magazine, in the communications and advertisements of its proprietor, Mr. Prince.

Bloodgood's Nursery, at Flushing, is principally devoted to the propagation of fruit trees. The proprietors are practical men, and have acquired a reputation for great accuracy and the fine condition of their trees.

Mills & Lawrence have also a nursery at Flushing, in which I understand Mr. Prince has become a proprietor, and which is probably embraced in the account of the Linnean garden.

Floy's Nursery, on the island of New York, is appropriated to the culture of both hardy and tender trees and plants. The collection of greenhouse plants is respectable, and comprises many rare and beautiful varieties.

Wilson's Nursery is in the neighbourhood of Floy's and embraces a like culture and variety.

Hogg's Nursery is also upon the island of New York. It is principally devoted to greenhouse culture and hardy shrubs.

The proprietors of the three preceding establishments stand high as horticultural botanists, and as men of practical skill and industry. The high price of land has in a great measure circumscribed their labors, and somewhat limited their culture to those articles which promise the most prompt and certain return.

The *Albany Nursery* was established by myself, in connection with Mr. Wilson, a practical gardener. In addition to the fruit and greenhouse departments, we are rearing many varieties of hardy forest trees, for utility and ornament; and our situation peculiarly qualifies us for furnishing seeds of native kinds in the best condition. We have spared no trouble or expense to obtain all the choice varieties of fruits; and have in progress descriptive catalogues, which I propose sending you when completed.

Botanic Garden at Brooklyn. This has been recently established by M. Parmentier, a gentleman of taste from the Netherlands. As M. Parmentier has brothers in the Netherlands and in France, eminent for their pomological researches, his establishment will be eminently useful, by introducing among us the finer fruits of the European continent.

Landreth's Nursery, at Philadelphia, is an old and respectable establishment, and is devoted to the culture of native and foreign plants hardy and tender. It has profited much in rare American plants, from the labors of botanists who have explored the interior, under the orders of government. The varieties of the magnolia are numerous, and in fine condition. I saw in this nursery, in August last, the Osage apple (*Maclura*?) in fine bearing.

The *Burlington Nursery* is in New Jersey, 20 miles above Philadelphia. It sustained a high reputation under Mr. Cox, and I believe, is likely to maintain its character under Mr. Smith, the present proprietor.

Kenrick's Nursery is at Newton, in the vicinity of Boston, and is appropriated to the raising of fruit and ornamental trees, &c.

Sinclair & Moore have commenced a nursery at Baltimore, principally, I believe, for propagating fruit trees. Respectfully, J. BUEL.

Albany, N. Y. Feb. 6th, 1828.

IDIOSYNCRASIES.

That curious, sympathetic, wonder working person, Sir Kenelm Digby, is perhaps, the greatest detailer of singular fancies relating to antipathies and sympathies. He narrates the dire effects of flowers upon certain people, even to fainting and dying. So obnoxious was a rose to the lady Heneage, that she had her cheeks blistered, says Sir Kenelm, by laying a rose upon her when she was asleep. It is even stated that Cardinal

Caraffa, and a noble Venitian, one of the Barbarage, were confined to their palaces during the rose season, for fear of their lives. Johannes de Querceto, a Parisian and Secretary to Francis I. king of France, was forced to stop his nostrils with bread when there were any apples at table; and so offensive was the smell to him, that if an apple had been held near him he would fall a bleeding.—*Shenck. Obs. Med.*

"I saw a noble countess," says Horstine, "who tasted of some udder of beef, and had her lips suddenly swelled thereby; observing that I took notice of it, she told me she had no dislike to that kind of dish, but as often as she did eat of it she was troubled in this manner, the cause of which she was utterly ignorant of. Bruverius knew a girl, sixteen years of age, who, up to that time, had lived entirely on milk, and could not bear the smell of bread, the smallest particle of which she would discover by the smell. An antipathy to pork is very common. Shenckius tells us of one who would immediately swoon as often as a pig was set before him, even though it be enclosed in paste: he falls down as one that is dead, nor does he return to himself till the pig is taken away from the table. Marshal Albert fainted away when he saw the head of a boar.

Horticultural rarity.—One of the finest samples of the advantages derived from the increased attention to gardening and fruit trees in this country, was presented to us yesterday, in the form of a most delicious peach, by alderman Peters, raised by him in his garden at Greenwich. It is one of the *Heath* species, vulgarly called the *October* cling, white in complexion, of exquisite flavor, and of a large size, being no less than ten inches in circumference, and weighing ten ounces—and it grew on a tree but two years old. Such delightful fruit, at this late season, when most others of the kind have entirely disappeared, and their yellow leaves are scattered by the piercing winds of autumn, is a rarity indeed, well worth the cultivation of the scientific votary of Pomona or the ordinary practical gardener.—*N. Y. Statesman.*

Extraordinary Growth.—We yesterday saw, at the store of Mr. John M. Ives, a crooked neck Squash, which weighed between forty and forty-one pounds. It was raised in the Garden of Mr. E. Jocelyn, of this town.—*Salem Observer.*

Cotton raised in Salem.—Two cotton bolls raised this year in the garden of Capt. Joseph Edwards, of this town, have been left at our office. The seeds were planted in May. The bolls are of a fair size and nearly ripe. We believe, that some successful experiments, in raising a few ripe bolls were tried in Worcester last year.—*Ibid.*

Vegetable Curiosities.—We are informed, that in several instances, on this island, the *Lilac* has put forth new leaves, and bloomed a second time. The flowers were as full, as delicate in colour and tints, and as fine scented, as those which shed their fragrance in the spring. A second growth of peaches has been had in New Jersey; and in various parts of the country, where no second growth has occurred, the character of the peach has been singularly changed in colour, flavor, and time of maturity—the branch that bore late fall peaches last year, producing high flavored rare ripens this—a month earlier than their regular period.—*N. Y. Statesman.*

Butter.—At the Fair of the Massachusetts Agricultural Society at Brighton, on Wednesday, the premium of *one hundred dollars*, subscribed by a number of gentlemen and placed at the disposal of the Society, was awarded to Mr. John L. Boylston, of Princeton, for the best butter. There was a large quantity of Butter exhibited, and it is confidently expected that the object for which the premium was subscribed will be attained, viz. the production of the first quality butter in large quantities and a corresponding decrease of the inferior qualities with which our market has for many years past been filled. Mr. Boylston's butter, we are informed, was sold for 25 cents per pound, cash.—*Boston Patriot.*

The adjourned meeting of persons in Salem and vicinity, interested in protecting Gardens and Orchards from trespassers, was held in Salem, 12th inst. E. H. Derby, Esq. Chairman, and T. P. Bancroft, Esq. Secretary. Articles of association were agreed to and a committee appointed to obtain subscribers to the same. The object of the association is praiseworthy, and we wish it success. Many a culprit has begun with robbing a garden, and ended his career in a public prison. The progress in crime in most cases is gradual.—*Ibid.*

Princeton.—This flourishing town in Worcester County bids fair to be the *prince* of towns in gaining premiums for fine stock, &c. at Cattle Shows. At the Worcester Show, not less than twelve premiums were obtained by citizens of Princeton, and a very large number of premiums, together with the hundred dollars' premium for best butter, were also at Brighton awarded to Princeton farmers. It is a town but little known, but of itself is an object of considerable interest. Wachusset lies principally within its limits, which is the highest land in Massachusetts. Its inhabitants live principally by agriculture, and are remarkable for industry, sobriety and agricultural enterprise. It has for many years been distinguished for fine cattle.—*Ibid.*

The Cattle Shows and Fairs at Fredericksburg, (Va.) are to be revived. They have heretofore been occasions of great interest. With a little of our Yankee industry and manufacturing enterprise, the "Ancient Dominion" would soon resume its ancient glory. The "American System" will after all be its salvation.

Preparations for the erection of the Capitol of Maine have been commenced at Augusta. The new College in Charleston, S. C. is nearly completed. It will be lighted with *Boston* glass, any thing in the tariff law to the contrary, notwithstanding.—*Savannah paper.*

From the Reporter.

SHEEP.

Feeling a lively interest in the prosperity of the sheep business in this country, having a flock myself, I have thought proper to communicate the following facts and observations to the public, with a view to excite inquiry and elicit information in relation to that disease which has carried off so many of these useful animals during the present season.

Some time in February last, I looked at a flock of *•••••* lambs, (about 200 in number,) belong-

ing to J. R. which I had seen in the fall; at that time they were in a thriving condition. In February, when I examined them, several had died and the remainder were very poor, and a general cough prevailed among them, which increased with a shrill sound, a dull and heavy appearance, and extreme emaciation. Some time after, I dissected a sheep of this flock, which had fallen a victim to the disease. I commenced at the cardia, (pit of the stomach,) and cut obliquely backward, in the direction of the diaphragm on both sides, more than half way between the spine or backbone;—thence to the pelvis on both sides, so that I could have a complete view of the contents of the abdomen. I found no adipose matter. I continued my examination about the region of the colon;—but found no inflammation, nor any other morbid appearance, until I came to the duodenum; it contained nothing but a little yellow, greenish slime, the duodenum somewhat inflamed, but the liver quite sound. I then passed the knife between the ribs and earlages which connect the ribs with the sternum, which I removed. I dissected the pleura and exposed both lobes of the lungs. They were indurated and inflamed from the extremity, more than half way to the bifurcation of the trachea or windpipe. I opened the pericardium, but saw no morbid appearance. I then laid the lungs open, and in the cellular substance of the lungs and in the bronchial vessels there were a multitude of worms about as thick as a linen thread, and from one to six inches in length, exceedingly sharp pointed at one end, and that end of a chestnut brown color, the rest of it of a pale white color. In a day or two after, I dissected another sheep while it was yet warm, and found the appearance precisely the same, only that the worms were alive; in the other they were dead. I directed Scotch snuff to be given to the sheep which seemed to be diseased, on their food morning and evening, and tar and sulphur once a day. They appeared to improve in health immediately. The same application was used in a neighboring flock, and apparently with good effect. Whether it is a remedy for the disease I will not undertake to decide, as but one or two experiments have been made; but it may be deserving a further trial.

WOOL GROWER.

NOTES. *Diaphragm*—The muscles which separate the chest from the abdomen.

Adipose—Fatty matter.

Colon—One of the large intestines.

Duodenum—One of the small intestines.

Sternum—The breast bone.

Pleura—The lining membrane of the chest.

Bronchial vessels—Air vessels.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 24, 1828.

THE BRIGHTON SHOW.

In our last we noticed some interesting particulars of the Show on the 15th, referring our readers to the respective Reports of the Committees, for a more full account. Most of the official Reports will be found in this week's paper.

A meeting of the *Massachusetts Society for promoting Agriculture* was held at the Society's Hall; and at half past one, the members with invited guests proceeded to the Rev. Mr. Austin's Church, where the Premiums were announced by the Assistant Recording Secretary. A procession was then formed to the Mansion House Hotel, where a sumptuous dinner was provided, at which

His Honor the Lieut. Governor, as President of the Society, presided. Among the guests were His Excellency the Governor, Hon. T. PICKERING, SENOR MANUEL LORENZO VIDAURRE, &c. As on the same occasion in years past, some of our horticulturists contributed from their stock of fine fruits, to enrich the dessert; and the table was enlivened by a great number of spirited and appropriate toasts. We have selected the following from among them:

Agriculture, Commerce, and Manufactures—the three great arteries of our national prosperity, composed of the same blood, and united by the same ties—a wound inflicted on either is felt through the whole system.

The Agricultural Societies in the United States—may their labors be viewed as joint stock, and a trial be annually made which shall contribute most.

Native and Foreign, Long Horns, Short Horns, and No Horns—are all alike to the niggardly and negligent breeder.

To the industrious Farmer—Large crops and great prices—to the sluggard and the sloven, short commons and Canada thistles.

Those distinguished Foreigners, THOMAS ANDREW KNIGHT and FRANCIS ANDREW MICHAUX, who have done so much to increase and to bring to light the natural resources of our country,—splendid examples in support of the principle, that no national or political distinctions should be known in Agriculture.

By His Excellency the Governor—

The Sword, the Press, and the Ploughshare, the great implements of labor and effect. May an independent yeomanry bear in mind, that on their soil it is the latter only, which can now be employed to improve by subverting.

The Plough.—Its one share in a bank of earth, is worth ten in a bank of paper.

The Fathers of the Revolution—They defended the soil at the cost of their blood, let us show our gratitude by faithfully tilling it, and handing it down to posterity improved by our labors.

Our Farmers!—Let them remember that "the ox knoweth his owner," and take care that their cattle be not ashamed of their acquaintance.

Let every cultivator be employed both in agriculture and politics; he comes to nothing who sits upon the fence.

Our native soil—The farmer's capital which can never be turned without profit.

Republican Heroism—Which consists in inflexibly doing right, in despite of misconception, misapprehension, and misrepresentation.

[Sent by the Hon. JOHN LOWELL, who was detained at home, by a severe rheumatic affection.]

My friends at Brighton.—Though forbidden the pleasure of bidding them welcome in person—yet my heart is always present at the Festival of the Farmer and Manufacturer.

[By the Rev. Mr. COLMAN, introduced by some remarks.]

JOHN LOWELL, "*the Roxbury Farmer*"—The high minded and disinterested patron of every public improvement. May the autumn of a life of action and eminent usefulness and patriotism, reap an ample harvest of honor, satisfaction and comfort.

By the President of the Society.

The Farmer's Holiday.—May each return of this anniversary bring with it renewed proofs of the advancement made in the science of agriculture, and the arts with which it is connected.

By Hon. T. PICKERING—Agricultural Societies, efficient means of improving the most useful of arts, and of good fellowship among citizens.

By F. HOWES, Esq. President of the Essex Agricultural Society. *The Memory of Washington*.—With whom Agriculture was the first, the last, and the most beloved employment of his life.

By THO'S G. FESSENDEN, Esq. *American Statesmen and other First Ratesmen*.—May they have a practical sense of the importance of that occupation, which employs seven-eighths of the hands, and feeds the sum total of the mouths of the community.

By Mr J. L. BOYLSTON, of Princeton. *His Excellency Gov. LINCOLN*.—Chief Ploughman of the State; he turns his furrows handsomely, and never looks back.

AGRICULTURAL EXHIBITIONS.

The annual meeting of the Rockingham, N. H. Agricultural Society was held at Exeter on the 15th inst. The exhibition was attended by a goodly portion of intelligent yeomanry from different parts of the county. The show of neat cattle was the best sustained part of the exhibition; some of them were very fine.

Mr. Peabody's address was highly spoken of, and a general wish expressed of having it published.

Among the premiums, were one of ten dollars for the largest quantity of corn on an acre, being eighty-six bushels and a half, to John Moulton, of Exeter. For the largest quantity of potatoes on an acre, being three hundred and ninety-eight bushels, to Josiah Butler, of Deerfield, six dollars. Premiums were awarded for filled cloth, carpeting, flannel, linen, blankets, manufactured leather, and for a black lace veil, a white lace handkerchief, cap, worked handkerchief, palm leaf hats, &c.

The following are the officers for the ensuing year:—

JOHN FOLSOM, *President*,

JOHN HARVEY, *Vice President*,

ICHABOD BARTLETT, *Corresponding Secretary*.

SAMUEL T. GILMAN, *Recording Secretary*,

FRESE DEARBORN, *Treasurer*.

James Rundlett, Clement Storer, Joseph W. March, Nathaniel Gilman 3d., Peter Patterson, Benning W. Sanborn, Jacob Cilley, Wm. Plumer, Jr., and Levi Lane, *Directors*.

Joseph Fowle, *Marshal*.—Oliver W. Hilton, *Dep. Marshal*.—Charles W. Cutter, *Orator*, for the ensuing anniversary.

CAROLINA SWEET POTATOS.

MR. SAMUEL POND, of Cambridge, has left at the New England Farmer office four Sweet, or Carolina potatoes, weighing four pounds—raised from slips sold at this place. Mr. P. planted one quart of the slips, in eighteen hills, which yielded three and a half bushels of very fine sweet potatoes. The hills were raised up on the soil like large squash hills—the slips placed in the top of the hill without any manure, and were not even started in a hot bed. The only care required, is to keep them free from weeds. The soil should be somewhat sandy. A few planted in a rich loam—

were very indifferent both as to quantity and quality. The fact that this delicious vegetable can be so easily raised in New England cannot be too generally made known.

DOUBLE APPLES.

We have received from Mr NATHAN MILLS, of Brandon, Vt. a few apples, all of which are either double, or triple. Mr M. informs us they are from a tree about thirty years old, which bears full every year; the apples always possessing this peculiarity.

Cider is now selling at Warner, N. H. at *fifty cents* per barrel—apples, best engrafted kinds, *seventeen cents* per bushel; common sorts, *ten cents*. In Boston, good cider sells at \$2.67 per barrel—best winter apples \$1.00 per bushel.—A rail road to Albany, with branches to the principal towns would equalize prices.

THANKSGIVING.

His Excellency Governor Lincoln, has appointed Thursday, the 27th day of November next a day of public Thanksgiving and Praise.

The same day is appointed a day of Thanksgiving, by Governor Tomlinson, in Connecticut.

The Worcester county Agricultural Society has eight hundred members, and a permanent fund of \$5000.

In our attempts to improve on nature, we frequently defeat our own purposes. Farmers are extremely anxious to get rid of moles, whose hillocks, it must be confessed, destroy the smooth level of grass and corn fields, when they are very abundant; but it has been found, (in some farms) by experience, that when moles are extirpated, worms increase so prodigiously that the moles have been wished for again, as the least evil of the two.

Prolific pea.—In a garden at Appleby, a single pea produced this season the enormous number of 500 peas, measuring in their pods, nearly half a peck.

Great growth.—From a single squash seed of the crook neck species, there has been produced in a garden in this village (the present season) five squashes, weighing as follows: 31 pounds—26½, do.—25½, do.—24½, do.—24, do. Total weight, 131½. *Taunton Reporter.*

ITALIAN SPICE SEED.

MR RUSSELL.—I send you per the bearer a small quantity of the Italian spice seed. It was first introduced into this town about seven years since, from Italy, via New York. The seed partakes of the qualities of the Thyme, Sweet Marjoram, Summer Savory, and Lemon; and answers all the purposes of those herbs combined for the stuffing of meats. The plant is about the size of the pepper plant, and requires about the same culture. The blossom imitates very much the Bachelor's Button, and the pod which contains the seed, that of the Columbine.

The seed is submitted for your consideration. I confess I never have seen any before. I think it may prove an acquisition to the valuable assortment of seeds vended at your Establishment.

Your obed't serv't,

JOS. G. TORREY.

Bath, Me. Oct. 8, 1828.

Blackstone Canal.—During the favorable weather succeeding the cattle show, the work for the full completion of the canal has been prosecuted with activity, and we understand, it will soon again be re-opened for permanent navigation, and during the remainder of the season may be used for transportation until the waters shall be closed by the winter's frost. In this respect the railway has superiority over the canal, that communication is not liable to be interrupted by cold, and during the winter may be used with the same advantage as in the milder seasons of the year.—*Worcester Egis.*

Upwards of 4,000,000 dollars are invested in a manufacturing establishment in Lowell;—and a canal is making for water privileges for twelve more factories.

REMEDY FOR THE GAPES IN CHICKENS.

Take as much kitchen soap as will cover the thumb nail, and having mixed it up with some meal dough, give it to your chickens, at any stage of the disease. This has been found effectual on the first application, almost always; a second is rarely necessary, and when it is so, it is next to impossible that it should fail.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

The collection of LILIES is very splendid, comprising Scarlet Chalcedonian Lily 50 cents, Orange Pomponne Lily 37 cents, Chinese Leopard 25 cts, Orange Martagon 37 cts, Yellow Martagon 37 cts, Double Violet Flamed 37 cts, Purple and White Scinted 37 cts, Bright Scarlet Pomponne 50 cts, Double White 37 cts, Large White Garden Lily 12 cents, Dwarf Chinese Red Lily (*Lilium concolor*, new and very superb, one root only) \$1.50.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colors, and showy flowers, large roots, 33 cts. each.

JONQUILLES—sweet scented, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 38 cts. each.

DOUBLE NARCISSUS—fragrant, of all colors, 19 cts. each.

SPRING CROCUS—of all colours, 6 cts. each, 50 cts. per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 3-16ths in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the mere refuse of the most inferior collections, good roots being worth at some ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

Also pots for blooming the Crocus, in the shape of Hedge hogs, Porcelain Dice-work Flower Baskets, (very beautiful) Beehives, Flower Pots, Half melons, Cones, &c.—a new article.

Two roots only of Wilmot's Superb Strawberry.

Just received at the

New England Farmer Seed Store,

No. 52 North Market Street—Boston.

Orchard Grass Seed.—Flint Wheat, &c.

A further supply of Orchard Grass Seed—growth of 1828.

Two hundred pounds of Red Onion Seed.

A few bushels White Flint Fall Wheat, commonly called Canal Wheat.—Also, Gilman Spring Wheat.

Just received at the

New England Farmer Seed Store,

No. 52 North Market Street—Boston.

New England Printing Ink Manufactory.

The undersigned has on hand from the above Establishment, a constant supply of Printers' Ink, warranted in no respect inferior to the best made in this country. Book, Roller and News Ink in large or small quantities.—Also Composition Rollers and Tables, of the most approved construction.—Terms reasonable.

JOHN BAKER.

Corner of Congress and Water Streets,
Opposite the Post Office.

Oct. 24 6t

Sausage Machine.

Orders for the Sausage Filling Machine, (post-paid,) sent to the Agricultural Establishment, No. 52 North Market Street, Boston, or to the subscriber, will receive prompt attention.

Dorchester Oct. 23. JOHN MEARS.
[One of the machines is left at the Agricultural Warehouse for examination.]

Out Meal, Out Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Out Meal, fine bolted Out Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few canisters of fine Out Flour, neatly packed, at 50 cts. per canister.

Hemp Seed.

A consignment from Troy, N. Y. of 50 bushels of Hemp Seed growth of 1827; by the fierce or bushel.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Gunpowder, &c.

Du Pont's Gun Powder, at 23 to 29 cts. per pound.—Shot—Balls—Flints and Percussion Caps.

Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the *Du Pont Powder Store*, No. 65 Broad street—By E. COPELAND, Jr.

[The Du Pont sold as above, is warranted first quality—and is marked "E. Copeland, jr. Boston," on the head of the cask.]

MISCELLANIES.

The Season.—A tree in Perth Amboy, N. J. has produced the present season two crops of peaches: the first of three bushels, the second of about a hundred peaches. The blue bushes in and about New York and Philadelphia have also, in several instances, produced two sets of flowers this season—strawberries of a good flavor, raised in the open air, have been lately gathered in a garden in Brooklyn, N. Y.

The Pensacola Gazette trusts that Florida will no longer be called "the Paradise for Rogues," since the Marshal of the District has received orders to put the U. S. Jail in that city, in repair.

Large Production.—Mr Russell Wood, of this town, took from his garden a few days since a common crooked neck winter squash, which weighed 34 pounds.—*Taunton Advocate.*

The corps of Engineers engaged in selecting a line for the Columbia and Philadelphia rail road, arrived on the 13th inst. in the prosecution of their labors, to within five miles of Philadelphia.

A number of citizens of New Jersey have held a public meeting in Mount Holly, with the object of having a rail road constructed between Camden, Gloucester county, and the Raritan river, or bay, in the county of Middlesex.

It is found that the lead on the dome of St Paul's Cathedral, London, has been fused by the action of the sun.

Prince Leopold has succeeded in bringing to perfection that extraordinary exotic, the air plant. It is suspended from the ceiling, and derives its nourishment entirely from the atmosphere.

Musters.—On Wednesday the 8th inst. the allied forces assembled on Salem common, and the spirit-stirring drums set many a leg in motion, and fired the breast of many a man with ardor not its own. The light companies appeared with unusual splendor, while, on the other hand, the heavy, that is the companies of the line, were unusually gloomy. It is a fact no longer to be concealed, that the present organization of the militia is wretchedly defective. We need no other argument to convince us of this, than the thin and wandering ranks of our militia. Companies in which, in "auld lang syne," one hundred men were enrolled, on Wednesday marched on the tented field with only ten; "still beautiful in ruins." The Salem regiment was in fact but a handful, and the officers "were few and far between." If our present system is continued much longer, musters will only contribute to show the nakedness of the land. In case of invasion, we verily believe it would be more effectual to summon the firemen, and rally round the engines and send our enemies to a watery grave, than to turn out the militia.—*Salem Courier.*

Messrs Hildiard & Brown, booksellers to the University at Cambridge, Massachusetts, have put to press the complete works of *Dugald Stewart.*

The Boston gas light company have issued the terms and conditions on which they will supply gas and fixtures. They propose to commence operations at the close of the present month.

From the American Farmer.

PLUMS.

THE PREPARATION OF PRUNES.

As some of your readers are anxious to learn the process of making prunes, I send you the following description of it, extracted from the French books. It is, you will perceive, exceedingly simple, and may be practised to any extent in this country, skill and industry might make it as profitable a business here as in Europe.

The plums must be gathered with the hand, when perfectly ripe. They cannot be too sound; and such as fall or are punctured by insects should be rejected. Arrange them on plates or sheets of iron so as not to touch one another, and put them in an oven after the bread has been taken out. While there turn and move them occasionally. When become cool, pack them compactly in boxes and secure them from moisture. If they are not dry enough when withdrawn from the oven, place them in the sun; for it would render them too dry and hard, to subject them to the heat of an oven a second time. In choosing prunes, prefer those that are new, soft, and fleshy. They will keep upwards of two years.

Prunes may be made of almost every sort of plum that is eaten. But those that are considered the best for the purpose, are the Gros damas de Tours,* the Imperiale violette, and the Imperatrice violette.

There is another preparation of plums, in which they are called Brignoles. For them are used chiefly, and almost exclusively, the White perdigon, which is a very fine sweet fruit. At the village of Brignoles, in Provence, in France, where this preparation was first made, the Perdigon plum is steeped in hot water to loosen the skin, then peeled, and then split open to remove the stone. The rest of the process is the same as in the preparation of ordinary prunes; that is, the drying in an oven and in the sun, and the packing away in tight boxes. The only difference, is, that less heat must be applied to the Brignoles than to prunes.

Besides the various preserves and sweatmeats that are composed of plums, the French peasantry make a liquor of the wild plum, by crushing it in water and letting it ferment.

AMERICAN GRAPES.

MR. SKINNER.—I send you enclosed some grape seed; the vine grows in a small island of Roanoke, a few miles above the Great Falls. It is surely the only vine of the kind in the State, perhaps in the world. I have had all the islands carefully examined, and another cannot be found. Its colour is purple, about one third larger than the common grape of the wood, slightly elongated, a difference in shape that distinguishes it from all others; in its flavor it is unrivalled, and when eaten diffuses a most grateful perfume. I prefer it to the Scuppernong. How it may succeed as a

* The Gros damas de Tours (large damask of Tours,) is not mentioned, at least under its French name, in Mr. Prince's catalogue. What its English name is, therefore, I do not know. It is thus described in the books already referred to; the tree grows to a large size, and is apt, when a standard, to drop its flowers; the fruit is rather long, of a moderate size; has a deep violet skin, floured, sour, and adhering to the flesh; the flesh is yellowish, almost white, fine grain and firm; the juice is sugary, and has the peculiar flavor of the damask plums. It is added, that if the skin, which will not separate from the flesh, did not communicate to it a disagreeable smell, this plum would be excellent.

wine grape, no one can say; but for the table it equals the best French grapes.

The late Gen. Allen Jones found a vine of the same kind in an adjacent island, about thirty years since, which he removed to his garden, where it thrived well and bore luxuriantly, but at his death, which happened a few years after, it was lost.—That from which I send you the seed has been known for some years to the Trappers on the river; who described it to me as being of the same kind with the one found by Gen. Jones. For three years I failed to get some of the fruit; this season I got a few bunches, when its fine flavor and rarity determined me to propagate it both by seed and cuttings, and through you to offer them to those who wish to cultivate the finest vine of this, and I believe of any country.

Yours, respectfully,

A. J. DAVIE.

P. S. General Jones called it the Perfume Grape. At the proper season I will send you cuttings; it is but a single small vine. These seeds should be directly placed in rich alluvial soil—they will come up next spring. I should be glad to have some directions how to put up the cuttings, and how to direct them.

My grandfather, the late Gen. Jones, who was the first botanist of the southern states, and curious both in shrubs and vines, considered this as the finest grape in his collection, and he had a great variety. D.

Wilson's Nursery, Derry, N. H.

The proprietors inform the public that their nursery offers peculiar facility for the acquirement of useful fruit; more than fifty thousand trees now cultivated by them, consisting of a great variety of Apples, Peaches, Plums, Cherries, Quinces, &c. embracing most of the celebrated and esteemed kinds in this country. The utmost care has been observed, by the original proprietor for more than thirty years, in making the selection and the whole is now offered as containing none but the most worthy of cultivation. Persons not acquainted with the different kinds by name, who wish to procure choice kinds, by stating the time they wish them to ripen, may confidently trust to the proprietors without fear of disappointment. All orders will be promptly attended to, and trees furnished at their nursery, this fall or next spring, at the following prices.

Apples, per hundred,	\$16
Peaches do	16
Plums do	25
Cherries do	25
Quinces do	\$16 and 25
Horse Chestnuts	25

FRESH SEEDS AND ROOTS.

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the *Rheum Undulatum*, or Tart Rhubarb, or Pie-Plant, an excellent article for summer use.—(See N. E. Farmer, vol. vi. page 290, and page 11 of this volume, and Fessenden's New American Gardener, article *Rhubarb*, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts. per root.

Potato and Tree Onions.

Also, a supply of Potato and Tree Onions. The Potato Onion has proved a fine acquisition to the list of vegetables raised in this country, and is getting into general use in the Middle States. They have produced 12 and even 20 fold in this vicinity the past season; come much earlier than the common, are milder, and more sure of producing a crop. Price 6 cents each, 50 cts. per dozen.

Indian Corn.

Several varieties of Field Corn, selected with great care, for its earliness and productive quality—also Early Sweet and the Early Jefferson Corn, for the table.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. will be published in the course of a fortnight, and forwarded gratis to any one who will send for it.

FOR THE NEW ENGLAND FARMER.

HORTICULTURE.

MR EDITOR—Having recently received complete series of the *Transactions of the London Horticultural Society*, of the *Annals of the Hort. Society* at Paris, and of *Louison's Gardener's Magazine*, I shall (according to your request) from time to time furnish such extracts, from them, as may seem to me to be useful to our country, and occasionally extend them to subjects, which are curious and amusing, though not directly applicable to our gardens. I would here observe, that nearly seven-eighths of all the articles in these works, are of no use whatever to our horticulturists generally.—It is plain from these publications, that the horticulture of England is at least 50 years in advance of that of France, and indeed the French writers all *virtually*, and some of them explicitly admit it. But the distance between us, and France, or Holland, or Germany, or Russia, in horticulture, is immense. I beg Messrs PRINCE, PARMENTIER and others to pardon this remark, for I except their excellent establishments. I speak only of the general state of horticulture.—of the general neglect of this art, compared with its high state of refinement in Europe, of which these works afford unquestionable evidence. I shall cite some proofs of this general diffusion of horticultural taste and knowledge, with the hope that it may excite in us a spirit of emulation. The taste for horticulture furnishes as correct a standard of the refinement of a nation, as the taste for the fine arts—if it is not as intellectual, it is much more comprehensive, and is capable of affording gratification to greater numbers. It is also intimately connected with health, and I am not disposed to admit that a taste for botany and floriculture, is not as well adapted to purify and elevate the mind, as even the fine arts themselves.

A ROXBURY FARMER.

Roxbury, Oct. 26, 1828.

REPORT OF M. DU PETIT THOUARS ON THREE PEARS SUBMITTED TO HIS EXAMINATION. (*Annales d'Horticulture a Paris, Feb. 1828, p. 86.*)

The object, which I have in view in calling the attention of our cultivators to this report, is to show them the attention which is now bestowed in Europe, on the names of their fruits, and the caution with which they admit new ones.

Of the three pears submitted to M. Du Petit Thouars as new varieties, he decided without hesitation, that two of them were old and well known ones. As to the third offered by M. Alfroy, some doubts arose, but on the whole he thought it bore a strong resemblance to an old well known pear, the Tarquin. M. Alfroy, the owner of extensive nurseries, which had been in his family for many generations, attempted to follow the career of M. Van Mons, of Luxembourg, in producing new varieties from seed. Out of 300 plants, which he selected as promising the best, judging from their foliage, only one produced a pear, which he tho't worthy of presentation: and this was the one on which M. Du Petit Thouars made the above re-

port, to wit, that it strongly resembled a pear of but moderate reputation.

The report concludes with these remarks.—“This able nurseryman, or cultivator, merits the more encouragement, since we find that he has not been lucky in this sort of lottery, since the sum total of his zeal and pains has only procured one single fruit worthy of notice, and to complete his ill luck, even this fruit is likely to be confounded with an old well known one, which is indeed a phenomenon more extraordinary, than the production even of a new fruit. It is well known that our neighbors, the Belgians, have been more successful in these attempts; but this is nothing, as they say, in comparison with the inhabitants of North America, who obtain numerous species from seed.”

It was for the sake of the parts *italicized* referring to our success, that I made the above extract, and it was done for the purpose of undeceiving the European cultivators on this subject. It is true, that we hear on every side of new varieties, but when examined, nine out of ten prove to have been imported. It is 33 years this season, since I turned my attention to horticulture, and I am not able to recollect any valuable table pear, the evidence of whose origin in this country is to be deemed unquestionable, except the Seckle, and a pear raised by Mr Johannot at Salem, not to be elevated to the first rank, though very desirable. A small winter pear, probably native, and said to be good, on the estate of Mr Lewis, at Roxbury. A very pleasant summer pear, said to be the produce of a Juneating, sent to me by Dr Alfred Baylies, of Taunton. And, a fine pear, raised on the estate of the late Hon. Mr Gore, which is probably a new fruit, and which seems to be between the Doyenne Blanc and the Doyenne Gris (in English, the white and brown St Michaels). These are all which have come to my knowledge. I am aware that Wm. Prince, Esq. of Flushing, claims to be the producer of some others, but not having seen the fruit, I am unable to speak of their merits.—My object in calling the attention of our cultivators to this topic, is to elicit information, and I most earnestly solicit it from all parts of New England, of any esteemed varieties of pears, together with the evidence that they are native productions. Our cultivators have adopted what I consider an erroneous rule, as to fruits which appear to them to be new. They assume, that every pear, the origin of which they cannot trace, must be a native; but the reverse of that rule is the most rational. Every fine pear should be presumed to have been imported, unless its origin can be distinctly traced; and I know no better proof of the reasonableness of this rule, than the experiments of Mr Alfroy, who obtained, in the favorite country of the pear, only one tolerable one out of 300. Even Dr Van Mons could obtain only 30 or 40 out of 800; and Mr Knight's success has also been limited, though both these gentlemen adopted the artificial mode of impregnation.

As to apples, there is no doubt, that we have produced many new varieties of great merit, which is not at all a matter of surprise, since for 200 years, it was our practice, to raise our orchards for cider, without grafting. Yet the list

of good table apples, compared to the many millions raised, will be found to be small. Even some of these may prove to have been imported. The Baldwin so long and so confidently claimed as a native fruit produced at Wilmington, it is now affirmed, was imported.

The peach more readily produces good varieties from the stone, and yet I doubt whether any nursery can produce any peaches, which to a jury of connoisseurs will be pronounced equal to the Van guard, Noblesse, Royal Kensington, Red and White Magdalen, or the Swaalsch. We have produced a nectarine larger and more beautiful than any European one, but I cannot think its flavor quite equal to the white fleshed varieties of Europe. I hope this may lead to discussion, inquiry, and improvement, which is the great end of all investigation.

Though we have not as yet produced many fine fruits, yet there is no country in Europe in which European fruits have as fine flavor, or are as abundant as in ours.

FOR THE NEW ENGLAND FARMER.

SMUT IN CORN.

MR EDITOR—Your correspondent E. on the subject of smut in corn, (see No 6 of your current vol.) has, in his outset, in my apprehension, pointed out the true cause for the unusual quantity of “smut ears,” namely, that “the fields of corn never looked me promising.” The season, and the soil which produce the greatest quantity of corn, will, according to my observation, occasion a correspondent average of smut. In my view, the cause is to be found in the exuberance of the fluid which forms the kernel. The vessels are surcharged and burst before the aliment can be duly concocted and disposed of. As far as human agency can avail, it is in the power of every farmer to lessen the evil. But in doing this most effectually, he would find the remedy much worse than the disease. This remedy is already too conspicuous on our farms. This evil, however, may be essentially lessened consistently with raising a great crop. Having had recent experience on this subject, I consider it my duty to respond to your call, although, of late, I have occupied an undue portion of your interesting and useful paper.

Eight years ago I cultivated a field of corn, for which I obtained a premium. To a liberal supply of strong manure ploughed in, I added the usual quantity of the same to the hill. The season was uncommonly favorable to vegetation. The growth was rapid and vigorous. The stalk was large and prolific in suckers. As the ear formed, the smut became conspicuous. I neglected to dislodge it until the fungus had burst through the husk in an unsightly mass. When consigned to my hog yard, it amounted to fifty wheelbarrow loads per acre. Notwithstanding this enormous drawback, my field produced the largest crop I have ever raised. I have cultivated the same field in corn the present season, with no variation except in the dressing. My coarse stable manure was spread and ploughed in as before. The hills were supplied from the compost made last year in

my yard, and carted in autumn, and thrown into large heaps, and covered from the weather. This season has been alike favorable to the crop; and I judge, when measured, the produce will be found to be nearly as great, without the fiftieth part of the loss by smut. The quantity has not been ascertained, as it was of so rare an occurrence as not to be worth the trouble, though severed, of bringing from the field. The suckers also were so free as to cause no injury. It appears obvious that the diminution of smut was occasioned by the quality of the manure applied to the hill.

The modern practice of ploughing in all the manure preparatory to the cultivation of corn, has, no doubt, a tendency to lessen the quantity of smut; but I doubt whether it affords as great a crop of corn. The old system of putting all the manure in the hill, is justly exploded by good farmers; yet the modern practice of spreading it all, is, in my opinion, erroneous. I am aware that the best farmers defend it. I took occasion to enquire of one who had received a premium for the best crop of corn, his process of cultivation. He informed me that he spread the manure and ploughed it in. I asked him whether he did not reserve some for the hill. On his answering in the negative, I further inquired, whether, if after he had spread what he should judge a sufficient quantity and had some left, he would not put that in the hill. His reply was, no—I would spread that also. My practice, as before observed, is otherwise. My reasons for it are that at the time of planting, the ground, if not wet, is usually heavy, and necessarily of a low temperature. The furrow for planting, if it does not remove the best part of the mould, leaves little or none at bottom. Instead of being supported on matter, warm and quickening, hastening vegetation and affording a free exit and expansion of the roots, the seed is consigned to a hard and cold surface, is more exposed to perish, more feeble if it vegetates, and more tardy in its early progress. To obtain a prolific crop, with early maturity, it is essential not only that the seed should be good, but that it should have some extra stimulus to induce a healthy and vigorous outset. Under a favorable commencement it is better enabled to overcome all the impediments in its course. To those who have spread all their manure, I can recommend no better substitute than equal parts of moderately leached ashes and plaster, well mixed, and as much as can be thrown in at once by the hand.

With respect to smut, my rule is to have it removed wherever it appears, as soon as discovered. By this practice a sound ear may often be saved which otherwise would have been blighted. It prevents the filth and dust from contaminating the ears and those who harvest it, and an annoyance, if not an injury to the stock that consumes it.

Yours with respect,

Worcester, Oct. 29, 1828. O. FISKE.

OFFICIAL REPORTS.

OF THE

MASSACHUSETTS AGRICULTURAL SOCIETY.

The Committee of the "Massachusetts Society for the Promotion of Agriculture" consisting of Messrs. LUKE FISKE, ELIJAH PERRY, and AMOS LIVERMORE, who were appointed to consider the several claims for premiums on Working Oxen, have attended that service, and Report—

That for the five premiums offered by the So-

cietly there were thirty competitors regularly entered, each deserving much credit: although it was out of the power of the Committee to award each a premium.

The Committee proceeded to compare them in reference to age, size, docility, equality of match, activity and form; and after a careful examination, and trial of their power and training, they award as follows, viz.—

To Henry Mellen, of Milford, his cattle four years old, first premium \$25

To Hiram Copeland, of Easton, his cattle four years old, second premium 20

To Asa Cummings, of Sutton, his cattle four years old, third premium 15

To Silas Dudley, of Sutton, his cattle five years old, fourth premium 12

To William B. Harrington, of Grafton, his cattle five years old, fifth premium 8

All which is respectfully submitted.

For the Committee,

LUKE FISKE, Chairman.

Brighton, Oct. 15, 1828.

The Committee appointed to award premiums on Sheep and Swine Report—

That they do not find any merino buck entitled to the first premium.

They award to George M. Barrett, the second premium, for a merino buck \$10

To Joseph Barrett, the first premium for the best merino ewes 20

To George M. Barrett, the second premium for the next best ewes 10

To John Mackay, the first premium for the best boar 12

To Silas Dudley, the second premium for the next best boar 8

To John Mackay, the first premium for the best sow 12

To George M. Barrett, the second premium for the next best sow 8

To John Mackay, the third premium for the next best sow 5

To John Mackay the first premium for the best pigs 10

To Joseph Barrett, the second premium for the next best pigs 5

The Committee were highly gratified to observe an improvement, this year in the number, form, and fineness of fleece in the sheep, and in the number and quality of the swine. And they are principally indebted for the improvement in the sheep, to the perseverance, and intelligence of Messrs. Joseph Barrett and George M. Barrett, of Concord, Mass.

The characteristic marks of a good hog, and a good proportion of them, well adapted to the respective breeds and varieties were observable in all the swine, that were exhibited. Those produced by Mr John Mackay were distinguished for great production for several successive years, for small bone, fine flesh, lively activity and excellent condition, as well as for their kindly disposition to fatten early and easily. There were some peculiarities in those brought by Mr Dudley and Mr Barrett, that deserved particular attention, for they evidently show sound judgement in the selection, and good management in keeping.

The Committee had great pleasure in noticing the several pens that were filled with sheep by the friends and benefactors of the Society, and which were offered for exhibition only. There

were four merino ewes and one Saxony buck offered by Gorham Parsons, Esq. that were justly distinguished for their superior form, quantity and fineness of fleece; and four excellent ewes from the Netherlands, that were presented to the Society by the Hon. THOMAS H. PERKINS, and also a buck and ewe of the Dartmoor or Devonshire Natts breed,* that were presented to the Society by Gen. JOHN COFFIN; all of them attracted great attention, and were deservedly held in high estimation.

JOHN HEARD, Jr.

SAM. JAKUES, Jr.

THO'S WILLIAMS.

FOR THE NEW ENGLAND FARMER.

POTATOS.

MR EDITOR—There has been a potato raised in Windham County, (Con.) for about twelve years, which was imported from England; I believe they are likewise raised in Rhode Island.—They are called Irish Whites, are white inside; the shape is generally longer than the English Whites. They yield well on good land—are of a middling size, and should be planted as early as possible in April to have time to ripen. They are esteemed, I believe, by all who have raised them, as superior for the table to any they have ever seen. They much resemble those potatoes described in N. E. Farmer, vol. vi. p. 337, called *Rogers Potatos*, except that I never saw any *red spots* on them. It may be, that the same kind or others equally good are raised in the vicinity of Boston, but I have never seen any Potato there that I considered fit for the table. Please to try a few of these I send you, for your own satisfaction.

Connecticut, Oct. 26, 1828.

C. T.

Remarks.—We have eaten of the above Potato, and according to our taste, (and *de gustibus non est disputandum*, anglice, there's no disputing our taste,) the Irish Whites are the very *ne plus ultra* of all possible potatoes.—EDITOR.

(Prepared by the Editor.)

BEES.

An able and very useful review of "*The Farmer's Manual, including a Treatise on the Management of Bees*," by FREDERICK BUTLER,* was published in the last number of the North American Review. We would republish at length this valuable essay, were we not pressed for room, and sensible that it is already in the hands of many of our readers. We will, however, extract some of the most practical observations, which may prove beneficial to some, who are not in the habit of perusing the work from which they are taken.

"A hive ought not to be considered as the house or habitation of the bee, for even in the forests, where there may be supposed to be abundance of hollow trees suited to their purposes, bees have built their cells on the under side of a stout branch; and they have neglected the convenient form of a well constructed hive, to attach themselves to the eaves of a house, or to the inner sides of a chimney. The nature of this part of their instinct goes no further than to secure a firm roof, to which they can attach the cells, and a firm position that shall protect the cells from the sun and rain.

* A specific character of the Dartmoor or Devonshire Natts sheep. Faces and legs white, necks thick, bones large, backs narrow, but back bones high and sides good.

The race is principally confined to the moor in the County of Devon, whence the sheep derive their name. The wool is long, weighing nine pounds on an average, at about two years and a half old.

"This faculty or instinct, is sometimes at fault; for we often hear of their adopting the strangest and most unsuitable tenements for the construction of cells. A hussar's cap, so suspended from a moderate sized branch of a tree, as to be agitated by slight winds, was filled with comb and bees. Any thing, in short, either near the habitations of man, or in the forests, will serve the bees for a shelter to their combs. * * *

"We have, for seven years, had a little colony under our immediate inspection, and we began our personal observation with the knowledge of all that ancient and modern theorists have advanced, in relation to the habits, customs, and manners of this wonderful insect. We came to their superintendence with a mind tinctured with all that was marvellous and fanciful, and with an ardour that seven years have not subdued; altho' theory after theory has now melted away, and most of the wonders and enigmas have been solved, and reduced to the clearest and most simple particulars. Our wonder and admiration, altho' deprived of the charms of the fanciful legends in which the history of the bee was embodied, are still undiminished, nay, increased; for an elevation of thought and feeling has been produced by the study. * * *

"After rejecting all the fanciful and marvellous speculations of the theorists, there are still several material points unsettled, on three of which we propose to make a few remarks at the present time.

"1st. The most modern and the most rational theorists differ in their opinion respecting the accuracy of the facts, that are stated in relation to the queen bee's leaving the hive at any other time, than when she goes forth with a new swarm.

"2d. They dispute, likewise, on the possibility of the bee's making a queen bee from a neuter, when circumstances require it.

"3d. They are still ignorant, whether the drone perform the office of nurse to the larvæ when deposited in the different cells.

"On the first point we venture to state unhesitatingly, that *the queen bee never leaves the hive, but when she accompanies a swarm.*" The writer then states the facts and observations, which enabled him to arrive at that conclusion, which occurred during six successive years. With regard to making a queen bee from a neuter, he observes that

"When a queen bee ceases to animate the hive, the bees are conscious of her loss; after searching for her through the hive, for a day or more, they examine the royal cells, which are of a peculiar construction and reversed in position, hanging vertically, with the mouth underneath. If no eggs nor larvæ are to be found in these cells, they then enlarge several of these cells, which are appropriated to the eggs of neuters, and in which queen bees have been deposited. They soon attach a royal cell to the enlarged surface, and the queen bee enabled now to grow, protrudes itself by degrees into the royal cell, and comes out perfectly formed to the great pleasure of the bees.

"The third point unsettled, and which is likely to remain forever a secret, is, whether the eggs of the queen are hatched after the manner of the eggs of fishes, whether they simply are animated by incubation, or by the care and nourishment bestowed on them by the working or neuter bees. On this point experiment has proved nothing.—

The greatest diversity of opinion exists. There are upwards of a thousand writers on the history and policy of the bee, yet no two have either observed or reasoned alike. * * *

"The little work, the title of which we have prefixed to this article, called 'The Farmer's Manual,' contains in a small compass, as much of the minutiae of the *management* of bees as is necessary to the common cultivator. Mr. Butler is a sensible, practical writer, as well on other branches of rural economy, as on bees, and we would recommend his book to all who are engaged in these pursuits; for, with some slight variation from his rules, such as a different climate would indicate, his experience may be beneficial to all."

The following practical remarks of this author are more particularly worthy of the attention of all who own or have the care of bees.

"We esteem it a very desirable object to make the care of the bee more common than it has hitherto been, in this part of the country. With the exception of a small one under the superintendence of the Society of Shakers, established at New Lebanon, we neither saw nor could we hear of more than a single apiary, on a journey last summer to Lebanon springs, although we made many inquiries. Never was there a country more suited to the cultivation of bees. Even in August there is an abundance of white clover, and small springs and shallow rivulets appear at every turn. There is no doubt that bees were formerly more frequently kept in America than at present. In many places in New Jersey, where there is now scarcely a bee to be seen, there once existed millions of these insects, to the great profit of their owners. It was common for one dealer in a country town, to sell from fifteen to twenty barrels of strained honey alone—to say nothing of wax and comb honey, as well as a kind of wine, made of the washings of combs, called *methaglin*. These articles of commerce have almost disappeared, and we find that it is mostly attributable to the millers, or night moths, which have of late years spread destruction through the hives.

"The attention of naturalists has been directed to the history of this fatal enemy of the bee, and many attempts have been made to construct hives that would prevent the miller from depositing its eggs in them; but the plans were defective, because there was no contrivance for inspecting the hives. Before we close this article, we will endeavor to give a description of a hive, that is so constructed as to enable any one to see the interior and to free it from all extraneous matter, as well as to protect it from the inroads of the night miller.

"On the general subject of the care of bees, the following remarks, the result of personal experience, may be acceptable to the reader.

"The situation of the apiary is of little importance. We have seen bees thrive as well with an eastern as with a northern aspect. If the entrance of the hive face the north, the bees may possibly be detained within, a minute or two later in summer; but this is more than counterbalanced by the same cause operating in winter, when it is desirable that the bees should remain in the hive. But for ourselves, we have seen no difference in the time of quitting the cells between those that faced the north, and those that had the southern exposure. Nor have we observed that there is any difference in the welfare of hives as

placed in valleys or elevated on hills, meaning of course of thirty or forty feet in height.

"We have seen hives prosper, adjoining a stercorary, and oftentimes near a piggery. We have known colonies of bees to exist for a term of 20 years, with no other protection from the heat and the cold, than the top of the hives. They have multiplied equally well under an open shed; but as a free circulation of air is necessary to their health and comfort, we have never known them to thrive when quite enclosed. A house, therefore, strictly so called, which is shut on all sides, may serve to amuse the observer for a year or two, but there must be an extraordinary combination of fortunate circumstances, if the bees increase, while confined in it."

(To be continued.)

NORTH CAROLINA GOLD.

A correspondent of the N. Y. Statesman supposes that the gold region in this country forms a belt on the east side of the Blue Ridge, extending from Georgia through South Carolina, North Carolina, Virginia and Maryland, to the Susquehanna in Pennsylvania. In North Carolina it is about 70 miles wide. The gold is found in three positions—in alluvial beds washed in former times from elevated regions; in ranges of white quartz, (flint stone); and in white quartz now forming veins in argillaceous rock. The mines should be called iron mines; gold is associated with the iron, but the iron is fifty times as abundant as the gold. It is estimated that there are 50,000 places in North Carolina where gold may be found. The miners and gold diggers get from 60 cents up to two or three dollars per day, each. They are generally a worthless, drunken people, without character, science, skill or capital. When they have worked a week, they resort to some whiskey shop in the neighborhood, and squander their golden treasures in rioting and drunkenness. Each operation about the mines is conducted in the most wretched manner.—*Hamp. Gazette.*

AMERICAN INSTITUTE.

The sale of articles, exhibited by this association, took place on Saturday, and attracted an immense crowd of spectators and purchasers. Many of the articles were sold, some of them at high prices. Among them we were informed that the broadcloths of which we made mention in our paper of Saturday, sold at from 6 to 8 dollars per yard; and three pianos, the manufacture of Du Bois & Stoddard, at the high prices of \$475, \$230 and \$295. The blankets, many of which were fine specimens, sold for from 5 to 9 dollars the pair—and two of the Long Island Leghorns bro't 55 and 29 dollars.

Thus it will be perceived, that splendid encouragement is given to the native manufacturer, by our wealthy citizens, to go on and improve his products. The excess of price given on such an occasion, is a patriotic sacrifice to the cause of domestic industry. That the time will come when most of the manufactures, which we now obtain from abroad, will be supplied cheaper at home, we have never doubted.—*N. Y. Statesman.*

Plausible Theory.—The Williamstown Advocate accounts for the forbidding aspect which our good New England people wear towards strangers, by supposing that it is produced by drinking vile sour cider.

PENNSYLVANIA HORTICULTURAL SOCIETY.

At the meeting of the Horticultural Society of Pennsylvania, on Tuesday evening last, the members were highly gratified with a fine display of autumnal flowers. Among the most striking of those from the gardens of the Messrs. Landreth's, were Dahlias, from Mexico, of almost every shade, from a pure white, with yellow centre, to a brilliant purple; a beautiful species of *Eupatorium*; several varieties of golden rod, [*Solidago*]; a rich species of American strawberry tree [*Esonymous*]; scarlet sage [*salvia splendens*]. &c.

From the same establishment were produced several new and beautiful varieties of seedling roses, tea roses, amaryllis from Mexico; golden trumpet, honey suckle [*Caprifolium Fraseri*], with other flowers, which attracted attention. Among those not already mentioned, was a flowering branch of the Franklinia [*Gordonia pubescens*]. This elegant tree was brought from Florida by the late Mr. John Bartram, and may well be ranked among the most agreeable ornaments of our gardens and lawns; it is at present flowering in the Messrs. Landreth's garden, on Federal street, and has been constantly in bloom for more than three months past. A variety of other flowers were reported to be now in bloom, among which were splendid Dahlias, *Campanula pyramidalis*, &c. at the gardens of A. Parker Prime street, and D. Maupay, on the Germantown road.—*U. S. Gaz.*

TOMATAS.

The following recipes were taken from an eminent French cook:

Tomata sauce for cold meat.—Boil tomatas when ripe, rub them through a tannin cloth; to every quart of pulp add $\frac{1}{2}$ ounce of garlic and 1 ounce of shallots; boil half an hour; strain out the garlic; add to every quart half a pint of common vinegar, and a wine-glass full of Chili vinegar; let it stand a day or two before corking.

Potted Tomatas.—Reduce your tomatas over the fire till they are quite thick, stirring all the time to keep them from burning; rub them through a tannin cloth, put them again in your stewpan, with an equal quantity of glaze, and reduce again over a sharp fire till you think the whole will be quite firm when cold, (or like glaze;) put them in a white earthen pot; when cold cover them with a writing paper dipped in brandy; over some warm hog's lard, and cover all over with a bladder tied quite tight. A small piece added to a little gravy, or melted butter, will make an excellent sauce for cutlets or chops.

Tomatas quite plain.—Reduce as before, only be more careful in evaporating the water from them; rub them through a tannin cloth, put them when cold into fruit bottles; they must be corked very tight and tied down; put the bottles nearly up to the cork in cold water, over a gentle fire, till they boil; then set them on one side till cold;—take them out and dip the cork in good cement, of bees' wax, rosin, &c. This may be used in making sauce for cold meat, or as above, by adding strong gravy. It is intended of course, to save the glaze.

Tomatas with gravy.—This is simply stewing your tomatas in a little good gravy till quite tender, keeping them whole; drain them on a sieve, dish them up, and pour a little half-glaze, and a teaspoon full of vinegar mixed with it, quite hot, over them.

Tomatas may likewise be put into vinegar as a pickle.

Towit of Tomatas.—Take a pint of the tomatas, add a pound of fine sugar, reduce it in the same way as a jam: add the juice of a lemon: this makes a very good towit.

Tomatas as a dried fruit.—The pulp may be reduced, say a pint, with a pound of fine sugar, till quite stiff; pour it on your tin: it must be dried in a stove; when nearly dry, cut it what shape you please; it does for ornament in the dessert.

THE BASTILLE.

A pamphlet has lately appeared at Paris, containing divers interesting particulars respecting the Bastille. Its foundation-stone had been laid on the 12th April, 1369, and, on the 14th July, 1789, the last stone of this building disappeared. Amongst other things, this pamphlet contains a list of distinguished individuals that had been confined in the Bastille, with copies of the warrants which M. de Sartine, Lieutenant of Police, had transmitted to the Governor. One of these runs as follows:—"I send you M. F—; he is a good-for-nothing fellow. Take care of him for one week, and then get rid of him." At the bottom of this paper is the following note, in the Governor's handwriting:—"On the — June M. F— arrived; and after the expiration of the appointed time I sent to M. de Sartine to enquire under what name I should have him buried."

MAPLE SUGAR.

The New York Daily Advertiser of Saturday, observes, "a new article of commerce is noticed in our Review of the Market. Upwards of 300 barrels of Maple Sugar have been received by the Canal, which has been sold at five cents a pound. Last season we understand, a parcel of about 70 barrels was received. It is supposed the manufacture of this article will increase and that it will soon be one of considerable importance. The supplies of Sugars from New Orleans have already increased to such an amount that they are rapidly taking the place of foreign sugars, and it is supposed by many intelligent persons, that in a very few years the supplies from New Orleans and elsewhere, will be sufficient for the consumption and that no foreign sugar will be required."

U. S. Gazette.

MILITARY MUSTERS.

A brigade review of the 5th division of the Massachusetts militia, was ordered at Berkley on the 7th inst. Nearly every company, the residence of whose members was more than fifteen miles from the place of parade, refused to obey the orders to muster.

Massachusetts Industry. It is ascertained, that the value of codfish, salmon, shad, mackerel, herring, oil matter, &c. annually taken from the ocean by the fishermen of Massachusetts, exceeds four millions of dollars.

MARYLAND CATTLE SHOW.

The annual fair of the Maryland Agricultural Society was held at Carroll's Point, near Baltimore, on the 16th inst. The collection of cattle was numerous, and comprised a variety of the finest breeds. The exhibition of domestic manufactured articles was more limited than on previous similar occasions.

Shoe Blacking.—Large sums are annually paid by our fellow citizens for the article of shoe blacking, a considerable portion of which goes to encourage foreigners. In confirmation of this assertion, it is stated on good authority, that there is annually imported into this country from England, shoe blacking to the amount of \$2,000,000, the chief part of which is made by Day & Martin, of London. This large sum might easily be kept in this country, and even in the pockets of those who have heretofore been in the habit of paying their portion of it, by each family's making their own; which can be done with very little trouble, and at small expense. Day & Martin's blacking is preferable to any other, as it gives a high polish, and does not injure the leather. It is made in the following manner:

To one pound of ivory black, in which has been mixed half an ounce of oil of vitriol and an ounce of sweet oil, add one pound of pulverized loaf sugar; mix the whole with a gallon of vinegar, and let it stand three days, when it is fit for use. It should be stirred often, and kept from the air to prevent evaporation. The cost of a gallon of this blacking is 75 cents; and it is retailed at the stores for 4 dollars.—*Williamstown Advocate.*

RAIL ROADS.

We have, on our first page, called the attention of our readers to an interesting letter from a gentleman in England on the subject of Rail Roads.* No man can read this and similar accounts of the successful operation of Rail Roads wherever they have been constructed, without wishing to see them adopted more generally in our own country and particularly in our own State. The public mind has been gradually preparing for such an enterprise in Massachusetts, and the experience of their utility will, we trust, soon dissipate any doubts of the expediency of the measure. The Report of the Directors of the Baltimore and Ohio Rail Road Company has recently been published, and flattering and encouraging accounts are given of the progress of that great work. So great is the confidence entertained of its ultimate success, that a capital of four millions has been subscribed; and, of this, two millions have been taken up since the last annual Report—the State of Maryland having become a subscriber for five hundred thousand dollars of the stock.

The preliminary measures, in regard to our Rail Road, are nearly completed, and the people of the Commonwealth will soon have an opportunity of judging, more accurately than at present, of the necessity and expediency of doing something to advance her prosperity. We look forward with much interest to the Report of the Board of Directors of Internal Improvement, which will be early made to the Legislature, as we doubt not the facts and arguments which they will be able to offer will remove the doubts of the most sceptical. We long to see Massachusetts awake to her interests. Her wealth and population and resources are adequate to any enterprise that her interest suggests. It is not the richness of her soil that constitutes her greatest wealth; but it is her industry, her mineral resources, her manufacturing and mechanical capacity and power; and these can be fully developed only by means of internal improvements—by roads, canals, and Rail

* The article advertised to by the Editor of the Yeoman, we shall soon present our readers.

ways. If she would even keep her own trade, and command the resources already developed, Massachusetts must do something, and that shortly, to prevent the tendency to diversion which her natural situation presents.

A RAIL ROAD through the State would be a small work for the State to accomplish. Look at it, a moment. Compare it with the works of improvement which the people of villages, and which individuals, are constantly undertaking and easily accomplishing. Go into one of our thriving manufacturing villages, where a handsome Meeting house has sprung up, as if by enchantment. This work, easily as it has been accomplished, was a greater undertaking for its projectors than would be a Rail Road for the State. Look at the improvements in the principal street in this village. The mere paving of a side walk is a greater work for the owners of the House lots by whom it has been done, than a State Rail Road from Boston to Berkshire. A direct tax upon the people, for the whole expense of such a road, would not fall heavier on individuals than the tax which has been readily incurred in improving half a mile of the highway through the centre of this town. But then there would be no need of such a tax. The credit of the State would accomplish it; and all the effect which the people would feel, would be in the benefits derived from the expenditure of the money necessary for its construction, and from the use of the road when completed.—*Worcester Freeman.*

PEACHES.

A few days since Mr. Josiah Allen, Jr. of Attleboro', exhibited in our market among the variety of other fruit, a quantity of the Heath Peach, which he has cultivated in his orchard. Of this delicious fruit the following description is given in Thacher's Orchardist:—"Of all peaches—of all fruits, it is said there is none equal in flavor to the American Heath Peach, a clingstone. It is large, weighing near a pound, in common. It is generally the last sort that ripens."

Mr. Allen, we are informed, has taken great pains to procure the most choice kinds of fruit, for which he now realizes ample remuneration.

Pontucket Chronicle.

SQUIRRELS.

These animals are making great havoc among the crops in Illinois, Indiana, &c. One man killed 400 in his field in one day, and the next morning they were as numerous as ever. They are constantly swimming across the Wabash, Ohio, & Mississippi rivers, and are killed by the boys in great numbers at their landings. They swim across rivers from a mile to a mile and a half in width.—*Hamp. Gazette.*

SILK WORMS.

Mr. Abbott, of Leominster, Mass. after successful experiments in the raising of silk worms, and obtaining their silk, has this year set out several hundred white mulberry trees, in further pursuit of this enterprising and amusing employment.

BUFFALOES.

The only beasts used for draught by the European Turks are buffaloes, and cream colored oxen. The buffaloes are huge, clumsy animals, and the Turks never eat their flesh except on one occasion. Strings of blue beads are hung about their horns and neck to preserve them from the effects of the evil eye.

CONTRIBUTIONS TO ENTOMOLOGY.

BY THADDEUS WILLIAM HARRIS, M. D.

No. II.

Family Carabide.

This extensive family contains numerous species which are arranged under various genera. The perfect insects usually conceal themselves during day under stones, and fly abroad at night. Like the Cicindelæ they live by rapine, and devour such insects as they can conquer, not always sparing those of their own family. Some species are to be found in the day-time searching for their prey in highways, or on plants. Some inhabit beneath the bark of trees, and a few appear to feed on the pollen of flowers. Most of them exhale an offensive odour, which remains on the fingers a long time after handling them. Others emit from the mouth or tail a caustic acid liquor, highly volatile, and irritating to the skin. Having incautiously taken up *CARABUS sylvosus* it assailed me with a sudden jet of this fluid, several drops of which reached my face, produced an acute scalding sensation, and left spots which remained inflamed for some hours. The species of the genus *BRACHINUS* have been long celebrated for their crepitating powers. Mr. Kirby calls them "the true counterparts of the skunk, exploding a most fetid vapor from the ordinary passage." This is the insect's mode of defence against its assailants, which it bombards with repeated discharges of smoke and noise, gun-boat like, from behind. The American bombardiers are fully equal, in this respect, to foreign species. The Carabide were employed by ancient physicians as internal remedies in various diseases; their acrid qualities might render them useful as external irritants, or as substitutes for blistering flies.

But few of the larvæ are known. Their habits are prodaceous; they are serviceable in destroying smaller insects and caterpillars, and do not attack or injure vegetation. They dwell in the ground, but some of the larger kinds have been found on trees, inhabiting the nests of caterpillars, and committing great havoc among them. The redoubtable enemy of the cut-worm appears to be one of the family.

The general shape of the larva is long, linear, flattened above, with strong curved jaws, six legs near the head, a distinct thoracic shield, and an anal proleg. They are blackish in color, and active in motion.

GENUS BRACHINUS.

*B. *medius.* Testaceous, elytra, dull reddish purple, obsoletely and broadly striated, antennæ fuscous.

Length five twentieths of an inch.

Body pale ferruginous or testaceous, with very short, decumbent, pale, ochreous hairs. Head with rugose impressions near the antennæ. Two first joints and base of the third joint of the antennæ testaceous, remaining ones fuscous. Anterior angles of the thorax obtusely rounded, disc very convex, with deep medial and submarginal impressed lines. Elytra somewhat polished, reddish purple, with six or seven obsolete and shallow striae. Feet ferruginous, body beneath darker. It is found beneath stones, and is sufficiently distinct from others by the regularly curved anterior angles of the thorax.

*B. *minutus.* Thorax dark ferruginous, oblong-cordate, elytra blackish purple, antennæ and ventral segments fuscous.

Length one fifth of an inch.

Head, thorax, and feet dark ferruginous, almost castaneous. Antennæ fuscous, except the two basal joints which are ferruginous. Head with two longitudinal indentations between the eyes. Thorax oblong-cordate, anterior angles subacute, disc very convex, middle longitudinally impressed. Elytra blackish purple, with a greenish tinge, obsoletely striate the alternate interstitial lines more elevated than the intermediate ones. Body beneath castaneous-brown, ventral segments fuscous.

Inhabits beneath stones, but is rare. The shape of the thorax approaches to that of the *crepitans*. Our most common species is the *funans*, F., which somewhat resembles the above in colors, but is over half an inch long.

GENUS ZUPHIUM.

*Z. *bicolor.* Pubescent, reddish-bay; coleoptera and abdomen castaneous, thorax canaliculate, elytra sulcate, antennæ compressed.

Length over eleven twentieths of an inch;—breadth of coleoptera between three and four twentieths of an inch.

Body reddish bay, with short decumbent, ferruginous pubescence. Head punctured; a lateral longitudinal impression each side near the antennæ; neck distinct, impunctured; second and third joints of the antennæ nearly equal in length, and with the first obconic; terminal joint flattened, oblong, rounded at tip; intermediate joints transverse, gradually broader to the penultimate one, and laterally compressed. Palpi with obconic joints, the terminal ones largest and truncate at tip. Thorax cordate, truncate before and behind, rather wider than long, anterior angles rounded, posterior ones slightly excurved, subacute; disc deeply and distinctly punctured, and longitudinally canaliculate. Coleoptera parallelogramical, basal and external apical angles rounded, disc chestnut colored, paler at base, widely grooved, the grooves punctured, obsolete at tip; external submargin with a few, remote, larger, ocellate punctures. Body beneath punctured, pectus postpectus and feet reddish bay, ventral segments castaneous. Tarsi with entire joints.

This insect must be very rare. The specimen from which this description is taken was presented me by Charles Pickering, M. D. who found it in the vicinity of Salem. Some doubts existing respecting the propriety of placing it in the genus *Zuphium*, the characters of the species are detailed particularly with reference to elucidating the genus, no other species of which I have seen.

GENUS HARPALUS.

*H. *sericeus.* Black, punctured, pubescent above; antennæ annulated with reddish-brown and fuscous; thoracic angles rounded; tibiae and tarsi reddish brown.

Length of the male two-fifths of an inch, of the female rather more.

Body depressed, brownish black, opaque, with distinct large punctures, and short, decumbent ferruginous pubescence above. Mandibles castaneous, palpi and three basal joints of the antennæ reddish bay, each of the remaining ones of the same color at the tip, and fuscous at base. Thorax distinctly margined, angles rounded, the posterior ones very obtusely; disc not much elevated, dorsal and basal lines obsolete, and in the place of the latter a broad, shallow, confluent punctured depression, uniting with the dilated lateral

margin. Elytral strike impunctured, submarginal series of punctures indistinct; apex of the elytra sinuate. Body beneath and thighs black, polished; tibiae and tarsi, reddish brown or bay.

This insect is very common on grass during the warm days of summer. It somewhat resembles *u. herbivagus*, and probably also *n. faunus*, Say; but is easily recognized by being entirely punctured, and sericeous above, by its more rounded thorax, its dark thighs, and annulated antennae.

Errata in the First Number.—Page 90, column 2, line 32, for *reproval* read *reproach*—line 34 for *description*, read *descriptions*—column 3, line 46, for *pupa*, read *pupa*—line 43, for *bunch*, read *lunule*—line 63, after *behind*, insert *with*—page 91, column 1, line 20, for *subsatoral*, read *subsatural*—line 41, for *lips*, read *lip*—line 62, for *punctubata*, read *punctulata*.

REMARKS.—It may happen that some may object to the technical language of descriptions. For brevity, as well as to answer other purposes of science, this is unavoidable, and to those, (and we trust they are many) who make Entomology a study it can be no disadvantage. The terms are explained in Samouelle's "Compendium" before mentioned, in Kirby & Spence's "Outlines to Entomology," and in the "Glossary to Say's Entomology."

No popular names of species are given because none are known, and because a scientific name is more appropriate and as easily remembered.—The advantage of a *name* is obvious, and has the authority of Linnæus, who says that, without one, a knowledge of facts is lost. "*Si nomina nescis perit et cognitio rerum.*" The supposed new insects have an asterisk prefixed.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 31, 1828.

GATHERING and PRESERVING POTATOS.

With regard to the time in which potatoes should be gathered, we find some difference of opinion among practical farmers. It is, however, acknowledged by all, that when intended for consumption and not for seed, they should not be gathered till they are ripe. The ripeness of the potato may be perceived by the appearance of the tops, which will begin to decay as soon as the roots have attained to maturity. After that period, we are told by some cultivators it is important that the potatoes should be gathered and housed as soon as convenient, or immediately after the tops are decayed, either by ripeness or frost. Others say they will keep best in their native beds till the ground is frozen. But, at any rate, it is best not to defer digging till very late lest cold weather should destroy or lock them in the ground till spring. The old fashioned mode of harvesting potatoes, was to dry them in the sun as you would grass for hay. Rees' Cyclopaedia says, "as soon as potatoes are gathered they should be *allowed to remain some days to dry before they are stored.*" This we believe to be wrong, for in our climate, an exposure of two or three days to a cloudless sun, in September or October, would cause potatoes to turn green, to taste strong and bitter and become in some degree poisonous. It is now said by practical farmers that the less the roots are exposed to sun or air, after being taken from the ground the better, and that it is advisable to permit some part of the soil in which they have grown to adhere to and mix with them, when they are deposited in their winter quarters. It

may be best, however, not to dig and house potatoes *immediately* after a "*soaking*" rain, but to let them remain a few days in the hills, to get rid of their superfluous moisture, which will in due time say some philosophers, be expelled by the vital energies of the roots, unless the ground is very wet, which might cause them to rot.

Mr. Buel, of Albany, who is a practical as well as a scientific cultivator, says, "it were better that the sun never should shine upon potatoes—that they should be housed with all the dirt that adheres to them—that it is beneficial to add more dirt in the bin or cask, to exclude external air as much as possible; and that their surface should be kept moist, and the atmosphere, which surrounds them as little above the freezing point as possible.

The Hon. O. Fiske, in an address to the Worcester Agricultural Society, in speaking of the potato, observes that "nature has not accomplished its maturation at the period in which the vines decay, and the farmer believes it to be ripe. It seems probable that the earth by some unknown process, perfects its qualities after it has attained its growth. That potatoes, which have remained the whole season in the earth, are more farinaceous and pleasant has been ascertained. A farmer in this town, who was in the practice of planting a large quantity, took his family supply from a spacious field, early in autumn. As the residue was intended for his stock, he deferred harvesting them till a late and more convenient period. During their consumption, his table, by mistake was furnished with some which had been destined for the barn. The quality was so obviously superior as to lead to an investigation of the cause. From that time the two parcels received an exchange of destination. Another fact illustrative of this position was stated to me by an eminent farmer in the vicinity of Boston. A distinguished agriculturist, from Scotland, who had dined at the best tables in the city and its neighborhood remarked, at the hospitable board of my informant, that he had not seen in this country, what, in Scotland would be considered a good potato. He imputed their difference to the different mode of cultivation. There they plant early and dig late."

The most expeditious way of gathering a potato crop, is, first to run furrows on each side of the rows, and then a deep one in the middle, which turns up most of the roots to the surface. In this way, however, we should apprehend some waste, and should not recommend it, except where potatoes are plenty and labor scarce. A hoe with prongs, such as is sold at J. R. Newell's establishment, 52 North Market-street, Boston, we believe to be the best implement for digging potatoes.

SWEET POTATOS.

Since our notice of Mr Pond's success in raising the Carolina Potato, we have received several specimens from different cultivators in this vicinity, among others, some very superior ones from Mr J. TIDD, of Roxbury, and Mr A. Houghton, Jr. of Lynn. One of our marketmen informs us they were never known to be so abundant in this part of the country. Mr Houghton accompanied his with the following remarks. "The Carolina Potato slips purchased at the New England Farmer Seed Store have done finely. The largest of those now sent you, when first dug, weighed 2½ pounds. I purchased four quarts of slips with which I planted 60 hills—began to use them in my family the last of September. I dug the re-

mainder a few days since. Those last dug yielded one bushel to five hills, size like those I send you. *The Common Potato, planted side by side, took thirty hills to the bushel.*"

CATTLE SHOW AT MANSFIELD.

The annual Show of the Bristol County Agricultural Society, took place yesterday at Mansfield. The unfavorable state of the weather in the morning probably prevented the attendance of some, and lessened to some extent the Exhibition. It was nevertheless, numerously attended, and altogether was a respectable exhibition. At the Ploughing Match in the morning 9 teams were entered, which executed their work in a manner creditable to the competitors. The show of neat cattle was equal probably to those of past years. The pens, which were the same which have heretofore been used for this purpose, were all filled, several of them with fine animals of foreign and mixed as well as domestic breeds. There was a variety of manufactured articles exhibited, although not a very large quantity. The show of cloths was small. Among the rare productions exhibited were specimens of sweet potatoes raised by Rufus Bacon, Esq. and by Dr. Green. At twelve o'clock the Society moved in procession escorted by a band of music, from Maj. Bates' to the Meeting-house. A prayer was offered by Rev. Mr. Briggs; after which the Society were entertained for upwards of half an hour by an address eloquently delivered by A. A. Locke, Esq.—The Society returned to Maj. Bates' where an excellent dinner was provided. Toasts were drank with very good wine manufactured and presented for the occasion, by Noah Claffin Esq. of Attleborough and Dr. Roland Green of Mansfield. The reports of the Committees &c. will be published in a future paper.—*Taunton Register.*

MANURES

Assist plants, by destroying predatory vermin and weeds. This, however, is not a property of animal and vegetable manures; they foster both those enemies of our crops. Salt and lime are very efficient destroyers of slugs, snails, grubs, &c. It is astonishing how ignorantly neglectful are the cultivators of the soil, when their crops are devastated by the slug, not to dress them so as to render the surface of the soil quite white, during a promise of a few days dry weather, with caustic lime. It is instant destruction to every slug it falls upon, and those whom it misses are destroyed by their coming in contact with it, when moving in search of food. It is a common practice to burn couch-grass, docks, gorse, and other vegetables which are very retentive of life, or slow in decay; a more uneconomical, unscientific method of reducing them to a state more beneficial to the land of which they were the refuse, cannot be devised. In breaking up heaths, such exuviae are very abundant; but, in all cases, if the weeds, leaves, &c. were conveyed to a hole or pit, and with every single horse-load, and with barrow-loads in proportion, a bushel of salt and half a bushel of lime were incorporated, it would in a few months, form a mass of decayed compost of the most fertilizing quality; the lime retaining many of the gases evolved during the putrefaction of the vegetable matter, and the salt and it combining to destroy noxious animals, which might form a nidus in the mass. By this plan, nearly all the carbonaceous matters of the refuse vegetables are retained; by burning nearly all of them

are dissipated. The forming of a compost such as that recommended, is justified and approved by the experience of many.

Stable manure, and all decomposing animal and vegetable substances have a tendency to promote the decay of stubborn organic remains in the soil, on the principle that putrescent substances hasten the process of putrefaction in other organic bodies with which they come in contact. Salt, in a small proportion, has been demonstrated, by Sir J. ringle to be gifted with a similar septic property; and that lime rapidly breaks down the texture of organised matters is well known.

There is no doubt that rich soils, or those abounding in animal and vegetable remains are less liable to change in temperature with that of the incumbent atmosphere, than those of a poorer constitution. This partly arises from the influence of the color of soils on vegetation. Some manures, as salt, protect plants from suffering by sudden reductions of temperature, by entering into their system, stimulating, and rendering them more vigorous, impregnating their sap, and consequently rendering it less liable to be congealed. *Gardener's Magazine.*

On the Cause of Curl in Potatoes.—It is stated by a writer in the *Gardener's Magazine*, that the curl in potatoes is occasioned by the depredations of a small worm. He says, that they lodge at the bottom of the stem, which, for an inch or more, is changed from its natural to a pale unhealthy colour; the ascent of the sap is obstructed, and the leaves not having a due supply, are deformed and diminutive. That in examining the end of the potato he discovered a small hole, which probably was the place where the egg had been laid, and where the worm was bred. For avoiding the evil he advises to prefer unripe sets to fully ripe ones, as a preventive where the curl is dreaded, which remedy has been proved by his own experience to be efficient. The use of unripe potatoes for seed has likewise the advantage, according to this writer, of giving a crop a month or six weeks earlier, than when sets are used which were fully ripe at the time they were gathered.

Vessels for cider.—The cheapest and best vessels for containing cider, are said by some to be white oak iron-bound hogsheds, made of heart stuff well painted and of a size to hold about three barrels and an half. These vessels should be smeared over with a little spanish brown and lamp black, once in about three years. Others recommend vessels for keeping cider in which the barrel boards are straight, but the vessels broader at one end than the other, to be set on the smaller end, with the bung-hole at the top. The advantage of this form is, that in drawing off the cider, though but slowly, the skin or cream, contracted by its fermentation, descends and covers the liquor and thus preserves the fixed air in the cider till the whole is drawn off.

Scaring small Birds from destroying Garden Crops.—A writer in the *Gardener's Magazine* says "Having repeatedly lost my whole crop of peas by the birds nipping off the tops immediately on their appearing above ground, I, to prevent this, fix pegs in the ground about 4 inches high, and at the distance of four feet from each other. To these, I attach a worsted thread from peg to peg, crossing them at intervals, something like what children call "scratch cradles." This effectually

scares the birds, as I have not lost a pea since I first adopted the plan. Seeds may be protected in the same way.

"When the birds attempt to perch on the strings they are overthrown, and so frightened that they never attempt it again; the worsted too, being of a clinging nature, their claws are sometimes entangled therewith, so that with difficulty they disengage themselves."

TREE PRESERVER.

Breed's newly invented tree preserver, which guards and protects the tree against the Grub and Canker worm, has received among other respectable Certificates the following:

TO THE PUBLIC.

We, the undersigned, witnessed several times the last season, in the garden of the inventor, the utility and advantage of Nathan Breed's new invented Tree Preserver; and we are fully of the opinion it will answer every purpose intended, and serve as a complete guard against the depredations of the grub or canker worm; which has for years past, and still continues to make great havoc in our gardens and orchards. We cheerfully recommend it to the public as being one among the simple, yet not less useful inventions.

John Pratt—James Breed—Daniel Breed—John F. Hillon—James Pratt—Samuel Carleton—James Breed, Jr.

Lynn, Oct. 23, 1828.

The above Tree Preserver is for sale at the Agricultural Warehouse, No. 52 North Market street, Boston.

Errata.—In the Report of the Committee on Agricultural Experiments, last issue, for *Bristol* read *Brighton*. The valuable Stock mentioned on page 102, belonged to J. Easterbrook Esq of Royalston, not the Rev. Mr Easterbrook of Athol.

Gardener wanted.

A young Gardener (an unmarried man) who has a complete knowledge of his business, and can give unquestionable references as to his habits and qualifications, is wanted to take charge of a place about one hundred miles from this city. To such a person a fine opportunity now offers, as regards a pleasant situation and fair compensation. No others need apply. Call on J. B. Russell, New England Farmer Seed Store.

Situation wanted.

A Scotch Gardener, (with a family) who has a complete knowledge of his profession, and can produce recommendations from many gentlemen in England (among others, one from J. C. Loudon, Esq. Editor of the *English Gardener's Magazine*) wishes to procure a situation in New England or the Middle States. Apply to Mr Russell, Publisher of the *New England Farmer*, Boston or G. Thorburn & Son, New York.

Fruit, Ornamental, Shrubbery Trees, and Plants, by Auction.

A large assortment of Peach, Apricot, Pear, Plum, and Apple, and Ornamental Trees, Shrubbery, Creepers, and Plants, will be sold at G. Channing's office, on Monday next, at 11 o'clock, A. M. Catalogues on the morning of the sale. Oct. 21.

Irish White Potatoes.

One basket only of the very superior *Irish White Potatoes* alluded to on page 113 of this day's paper.

Several varieties of Field Corn, selected with great care, for its earliness and productive quality—also Early Sweet and the Early Jefferson Corn, for the table.

Just received at the

New England Farmer Seed Store,

No. 52 North Market Street—Boston.

New England Printing Ink Manufactory.

The undersigned has on hand from the above Establishment, a constant supply of Printers' Ink, warranted in no respect inferior to the best made in this country. Book, Roller, and News Ink in large or small quantities.—Also, Composition Rollers and Tables, of the most approved construction.—Terms reasonable.

JOHN BAKER,

Corner of Congress and Water Streets,

Oct. 24

6t

Opposite the Post Office.

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be published to-morrow, the *New England Farmer's Almanack* for 1829. By Thomas G. Fessenden, Editor of the *New England Farmer*.—For sale, wholesale and retail, at the N. E. Farmer office, No. 52 North Market street, by Fowles & Dearborn, 50 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office.

Fruit Trees.

WM PRINCE, the Proprietor of the Linnean Botanic Garden and Nurseries at Flushing, Long Island, has the pleasure of informing the public, that his Nursery now contains 172 varieties of the Apple, 292 do. of the pear, 76 do. of Cherries, 139 do. of Plums, 52 do. of Apricots, 31 do. of Peaches, 29 do. of Nectarines, 10 do. of Almonds, 11 do. of Mulberries, 6 do. of Quinces, 16 do. of Figs, 16 do. of Currants, 15 do. of Raspberries, 47 do. of Gooseberries, 20 do. of Strawberries, 257 do. of Grapes, 600 do. of Ornamental Trees, &c. Above five hundred of the above kinds of Fruits are not to be found in any other collection in America. The different varieties cannot be otherwise than genuine, as the greatest attention is paid, and nearly all the kinds are inoculated from bearing trees. The Cherry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of J. R. Newell, at the Agricultural Warehouse, No. 52 North Market street, gratis; and orders left there, or sent by mail, will meet prompt attention. Oct. 32

Wilson's Nursery, Derry, N. H.

The proprietors inform the public that their nursery offers peculiar facility for the acquirement of useful fruit; more than fifty thousand trees now cultivated by them consisting of a great variety of Apples, Peaches, Plums, Cherries, Quinces, &c. embracing most of the celebrated and esteemed kinds in this country. The utmost care has been observed by the original proprietor for more than thirty years, in making the selection and the whole is now offered as containing none but the most worthy of cultivation. Persons not acquainted with the different kinds by name, who wish to procure choice kinds, by stating the time they wish them to ripen, may confidently trust to the proprietors without fear of disappointment. All orders will be promptly attended to, and trees furnished at their nursery, this fall or next spring, at the following prices.

Apples, per hundred,	\$16
Peaches do	16
Plums do	25
Cherries do	25
Quinces do	\$16 and 25
Horse Chestnuts	25
Oct 3	6t

JOHN A. & SAMUEL WILSON.

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

M. Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries in the districts of Bordeaux, Clerac, and Buzet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1828.

Mr. A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designating the quantity and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1/2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1/2 cents for less than one 100; and 15 cents for less than 50 roots.—Payment to be made on delivery of the roots.—Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 35 Wall street—Boston, E. Copeland, 72—Albany, R. M. Michael—Philadelphia, Van Amringe, 2nd moor, William Rhoad—Washington City, Wm Paro, Richmond, Havensport, Allen & Co—Savannah, Hall, Shapter & Tupper—New Orleans, Foster & Hutton, Charleston, (S. C.) J. & J. Street & Co. Mr. A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal book-sellers of the United States; and his agents will furnish them gratis to subscribers.

Sausage Machine.

Orders for the Sausage Filling Machine, (post-paid,) sent to the Agricultural Establishment, No. 52 North Market Street Boston, or to the subscriber, will receive prompt attention. JOHN MEARS
Dorchester, Oct. 23.
One of the machines is left at the Agricultural Warehouse for examination.

MISCELLANIES.

The following lines to a ROBIN, that flew in at the window of Mr GRAHAM, will be read with no regretted loss of time.

"From snowy Plains, and icy Springs,
From moonless Nights, and sunless days,
Welcome, poor Bird! I'll cherish thee;
I love thee, for thou *travest* me.
Thou need'st not dread a *Captain's* doom;
No! freely flutter round my room;
Perch on my late's remaining string,
And sweetly of the SUMMER sing.
That note, that SUMMER note, I know;
It wakes at once and soothes my woe,
I see the woods, I see the stream,
I see—ah still prolong the dream;
Still with thy song, those scenes renew,
Tho' through my tears, they reach my view.
Thou heedless of the raging blast,
Thou'lt dwell with me till WINTER's past;
And when the *Primrose* tells, 'tis SPRING,
And when the *Thrush* begins to sing,
Sorn as I hear the woodland song,
I'll set thee free, to join the throng!"

We copy the following from the last number of the English Gardener's Magazine. Mr LORRAN, the Editor, remarks, "a little care would have made this story of the progress of Mr Thorburn's taste for plants, as good in its way as the *Pilgrim's Progress*, but we have printed it word for word as we received it."

Messrs. Thorburn, New York.—MR EDITOR, In your Magazine (Vol. ii. p. 345.) I observe a notice of the seed establishment of Messrs Thorburn of this city. I have often heard Mr Thorburn relate the following interesting anecdotes of his life, and as you may rely on them as facts, I doubt not but they will amuse many of your readers:—Mr Thorburn is a native of Dalkeith, near Edinburgh, and was by trade a nail-maker. In 1793 he belonged to the societies of parliamentary reform, known by the name of Friends of the People, and was a prisoner on that account at the time Muir, Palmer, and others were tried and banished. He got out of jail by the influence of friends, and landed in New York in 1794, being then in his 20th year. He followed nail-making six years in New York, when the introduction of cut-nails, [nails cut out of sheet iron by machinery] deprived him of employment. He then took to keeping a small retail grocery store; but as this did not fully occupy his time (for even now he works among his seeds and plants almost night and day,) he got a quantity of common flower-pots, and painted them with green varnish color, the sale of which exceeded his expectation. In the spring of 1801 he observed a man selling plants, the first he had ever seen for sale in the market.—Carelessly passing the stand, he broke a small leaf, and it smelling agreeably, he enquired the name of the plant from which he broke it, and was told that it was the Rose geranium. Mr Thorburn says until that moment he never knew there was such a plant in the world as a geranium. Taking another observation he thought the plant would look well in one of his green flower-pots, to stand on the counter, to draw attention (not for the purpose of sale.) However, next day some one fancied the plant and pot, which were sold at a shilling advance. He next purchased two plants, and disposed of them also; soon after he had twenty or thirty, and, erecting a small stage in his shop, opposite the door, he carried on a regular trade of plant-selling. This being something novel in New York, it drew attention. Strangers, when going the rounds of curiosity, stepped in to see the plants: some wished to buy, but could not

convey the plants 200 or 500 miles into the interior, and would buy the seed if it could be had; others, again, would ask for cabbage or radish seeds; but as no one made a business of selling seeds in New York in those days, he could not find any to commence with. He related his plans and difficulties to the gardener from whom he bought all his plants, who informed him that he was now saving seeds with the intention of selling in the market the following spring; but if Mr Thorburn would take his seeds and plants, he would keep at home and raise plants and seeds for Mr Thorburn to sell. A bargain was struck, and he thus commenced with a stock of fifteen dollars' worth of seeds. Just as this stock was sold off, a passenger in a ship from London called, and offered to sell Mr Thorburn a small invoice of seeds which he had brought out. On opening the cask, he found a catalogue having the time of sowing on the margin. This, Mr Thorburn observes, was a prize to him, as it gave him the time of sowing, and also a model from which to print one for himself. After surmounting many difficulties, the seed store is now located in a building 60 ft. by 40 ft., late a meeting-house of the Society of Friends, in the very centre of business. Perhaps there is no where to be found a building so well adapted, and a seed-shop so well filled up with every thing necessary for the garden and farm, as in this establishment. Seeds, tools, pots, glasses, roots, and a library of the latest English, French and American works on botany, gardening, &c. are kept for sale, and also for the inspection of the public (gratis). The seed drawers behind the counters run the whole length of the shop. Suspended above the drawers, in handsome glazed gilt frames, is a complete set of Curtis's *Atlas*, folio-sized, splendid and beautifully coloured plates of camellias, prize carnations, pinks, auriculas, ranunculuses, dahlias, &c.

The large high windows are shaded with landscape cloth blinds, and the walls above the shelves and drawers are ornamented with elegant scenery from the Alps of Switzerland, done on French hanging paper. As you enter into the front doors, it has the most imposing appearance of any thing of the kind I ever saw, either in America or Europe. In front of the shop, to the height of the bottom of the second story windows, is a green-house, 85 ft. long, and 18 ft. wide.—Through this you pass into the shop. This green-house is built on the most approved plan, and contains now about 3000 plants. Between the green-house and the street is a bed about 80 ft. by 25 ft. which, in the season, is filled with the handsome Dutch hyacinths, tulips, &c. The whole is enclosed with a neat iron railing and two gates, where passengers are invited to walk in and look around, and only required to shut the gate behind them. It is a fact, which I have heard the Messrs. Thorburn often mention, and which says much for the good conduct of the inhabitants, and the taste they begin to have for these beautiful works of nature, that neither by night nor day have they known any of the flowers or fruits on their premises to be taken away or in any way injured, although the oranges and lemons hang within 4 ft. of the railing fronting the streets, and may be easily reached with a hook or scape-net. The railing is only 4½ ft. high, and they keep neither man nor dog to watch by night. Their whole establishment occupies 83 ft. by 90 ft. (Observe, it is in the heart of the city.) The ground behind the

shop is appropriated to hot-beds and plant-pits and was formerly the burying ground of the Meeting, but has been very little used for that purpose for twenty years past. The Friends wishing it to be occupied as it is, sold it for a moderate price to Messrs. Thorburns, 20,000 dollars I have heard. Before giving possession, the whole ground was trenched to the depth of 7 ft., and all the bones removed to a neat cemetery prepared for the purpose out of town. As the spot I have been describing, and the owners, are known to some of your readers, I have no doubt but they will be glad to hear of them. Messrs. Thorburn & Son have done more to place gardening on a respectable footing, than any other two men in America.

HORTULANUS.

New York, July 16, 1828.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

The collection of LILIES is very splendid, comprising Scarlet Chalcedonian Lily 50 cents, Orange Pomponne Lily 37 cents, Chinese Leopard 25 cts., Orange Martagon 37 cts., Yellow Martagon 37 cts., Double Violet Flamed 37 cts., Purple and White Spotted 37 cts., Bright Scarlet Pomponne 50 cts., Double White 57 cts., Large White Garden Lily 12 cents, Dwarf Chinese Red Lily (*Lilium concolor*, new and very superb, one root only) \$1.50.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots, 38 cts. each.

JONQUILLES—sweet scented, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 38 cts. each.

DOUBLE NARCISSUS—fragrant, of all colors, 19 cts. each. SPRING CROCUS—of all colours, 6 cts. each, 50 cts. per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 3-10ths in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the mere refuse of the most inferior collections, good roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

Also pots for blooming the Crocus, in the shape of Hedgehogs, Porcelain Dice-work Flower Baskets, (very beautiful) Beehives, Flower Pots, Half melons, Cones, &c.—a new article.

Two roots only of Wilmot's Superb Strawberry.

Just received at the

New England Farmer Seed Store,
No. 52 North Market Street—Boston.

Orchard Grass Seed.—Flint Wheat, &c.

A further supply of Orchard Grass Seed—growth of 1828. Two hundred pounds of Red Onion Seed.

A few bushels White Flint Fall Wheat, commonly called Canal Wheat.—Also, German Spring Wheat.

Just received at the

New England Farmer Seed Store,
No. 52 North Market Street—Boston.

Grape Vines.

The subscriber offers for sale Grape Vines of several varieties, the produce of his garden in Dorchester; among them are the following

Isabella	White Muscat
Sweetwater	Black Hamburg
Black Cape	Elba
Queen	Muscatel [Muscatel
Early Oval	Alexander's or Schuykill

They are principally of one year's growth, planted under his direction and superintendence, are warranted genuine, and are in a healthy and vigorous state.

The subscriber proposes to continue the cultivation of such varieties of the foreign and native vines as are suited to this climate and that will thrive in the open ground in town or country.

Application may be made to the subscriber, at his office, No. 7 1-2 Congress Street, or at the Garden, to Patrick Kennedy.
Boston, Oct. 3, 1828. ZEBEDEE COOK, Jr.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOVEMBER 7, 1828.

No. 16.

HORTICULTURE.

FOR THE NEW ENGLAND FARMER.

CURIOUS FACTS AS TO THE PARIS AND LONDON FRUIT MARKETS.

The facts as to the markets of Paris, are taken from an article on the fruit and vegetable markets of Paris, by M. Masson, Commissary General; published in the *Annales d'Hort. de Paris*, April, 1828.

"In order to form an idea of the production, with which horticulture enriches the Paris market, says M. Masson, it is necessary to begin with this market at the end of March, and the first fifteen days of April. At this period and whilst you still see a *parade* in the fruiterer's shops, of fruits of great beauty, preserved at great expense, the *market is almost naked*. A few baskets of apples little esteemed, are scattered thinly about, and seem to wear the sad livery of winter."

Prices in March 1828.

APPLES. Calville blanc per hundred, 40 francs or nearly eight cents each (much dearer than oranges).

PEARS. St. Germain, 80 francs per hundred, or 16 cents a piece.

GRAPES. Chasselas de Fontainebleau, per lb. 3 francs, or 57 cents.

April, 1828.

APPLES. Calville blanc, per one hundred, 110 francs, or 22 cents each.

PEARS. St. Germain, per hundred, 140 francs, or 26 cents each.

Prices at Covent Garden, London, March 13, 1828.

APPLES. Nonpareil, 15 to 36 shillings a bushel. Average, \$5.50 a bushel. Golden Pippin, average price \$10 a bushel.

Hot house GRAPES (new crop) \$10 a pound.

[On Feb. 9, 1828, grapes (last year's crop) were sold from 33 cents to 66 per pound.]

The January price of Onions in Covent Garden is 44 cents a bushel!! best quality of potatoes for table average \$15 a ton, which estimating the bushel at 75 lbs. (a great allowance) would give for the ton 26 bushels, and make the price per single bushel 57 cents.—Asparagus, in January, plentiful and cheap at from 22 cents, to 160 cents per hundred.—Savoy cabbages at from 1s 6d to 3s per dozen, or from 3 to 5 cents per head!

Apples, in February, from 3s 6d to 10s 6d per 10 quarts, and pears from 2s 6d to 10 per ditto, or about, on an average, 133 cents per 10 quarts, or \$4 a bushel. These English prices are lower than the French; and, than ours, by retail.

Though asparagus may be had in London in January, at a price as low as it brings here in the first ten days of May, yet it does not appear in the Paris market till the middle of April, and then the price is about one dollar fifty cents per hundred, or much dearer than the average Covent Garden price for the same article in January. London is $2\frac{1}{2}$ degrees to the north of Paris.

But the most remarkable fact relates to the grape. In Paris the grape begins to appear towards the end of September, and becomes abundant in October. "It is (says M. Masson) the superb Chasselas of Thomery that the preemin-

ence is due, acquired by the care with which it is cultivated, and the intelligence by which that care is directed. [In this tribute he agrees with the authors of the *Bon Jardinier*.]

"The culture of the Chasselas is very productive. It gives us pleasure to see, that it is extending, particularly at Montreuil, where there will be a rivalry with Thomery, favorable to the consumers. The cultivator ought to be well rewarded, but 57 cents for two pounds and an half of grapes, is exorbitant, and ought to produce competition."

This price, it will be perceived, is given for the Chasselas in September, and October in Paris.

In London, new grapes are sold at \$10 per pound, in January. By the first of May, they fall to \$1.33 to \$3 per pound. And from July to Sept. 4, they are quoted at from 4 to 7 shillings the dozen pounds, or from 8 to 13 cents a pound. Thus the London forced grapes appear 2 months before those of Paris, and are sold at half the price!!

[I have no doubt that in 10 years from this day Boston will be supplied with forced grapes, in July, at 20 cents a pound, every year, and to the full demand.]

FRUITS IN FRANCE.

There is, however, a part of Mr. Masson's communication as to the Paris market, which is more interesting to us—

"The peach has disappeared, and also the beautiful plum (says Masson) towards the end of September. These are soon replaced by the Beurre (pear) the Doyenne, (*St. Michael*). The Mouille bouche, (*mouth water*) the Roupetet, the Peire d'Angleterre—and some other pears of the season. One is astonished to see no longer but few melting pears—we no longer find the Sucre vert, the Sucre musique, the Besi de la Motte—very few Chaumontelles—very few Culotte de la Suisse—no Royale d'Hyver—no Virgouleuse, and it is to be deplored, no Colmars. These three last species would fetch (in September observe) from ten sous to two francs (thirty-eight cents) a piece—and yet these fruits are neglected!!"

This is an entirely new view of the state of pears in France. It should be remembered that this is written by a commissary of the markets of Paris, and inserted in the official work of the new Horticultural Society of Paris. Its facts must be authentic. Is it then to be wondered at, that these delicate pears fail with us, and that the French gardeners are seeking with avidity after the new varieties of Belgium and of England?

Do not these facts give great color to Mr. Knight's opinions, that the old varieties are wearing out? Do they not enhance our obligation to that gentleman for his presents of the new varieties? and can we be too vigilant and too assiduous in spreading them?

The pear is, after all, far the most valuable fruit for the table. Its almost infinite varieties—the great length of time which its several varieties endure (from August 10th, to May)—its wholesomeness—the longevity of the trees, all conspire to render it the most valuable table fruit. I do not compare its usefulness with the apple which unquestionably is more useful on the whole.

The pears, which we now have, were introduced by the Hugonots, who on the revocation of the Edict of Nantz fled to this country. The original trees are in some instances to be found in the gardens laid out by the FANUELS, the JONONOTS, and others, and nearly all which we now have, may be traced to them. Within the last thirty years extensive importations have been made from France; but a large proportion grafted on quince stocks are dead or decaying. Of fifty pear trees imported from Vilmorin, eighteen years since, I have only eight or nine miserable sickly plants alive. The loss at Mr. PREBLE's garden has been still more severe. Our true policy is to raise healthy pear stocks, and speedily engraft them with all the new varieties. J. L.

Roxbury, Nov. 3, 1828.

FOR THE NEW ENGLAND FARMER.

FOOT ROT IN SHEEP.

The following mode of treatment is recommended for this most troublesome disease in sheep, by a very intelligent and highly distinguished gentleman residing in Vermont, in a letter to his friend in this city. This gentleman was among the first who introduced the fine woolled sheep into this country, and is now the owner of a very large flock of the finest woolled sheep, many of which were imported direct from Saxony, and are of the purest blood. The opportunities this gentleman has had, both in Europe and in this country, for investigating the causes and effects of this disease, renders his advice invaluable: and every wool grower should preserve these directions as a rich legacy from one of his country's benefactors.

"By great attention with dry, hilly, sound pastures, the constitution may be so improved that we may ultimately eradicate this vexatious and injurious disease. My remedy has been as follows: When the sheep were only slightly affected, to put on one, two or three dressings of blue vitriol, powdered fine, either dry, or mixed with olive oil to the consistence of soft salve, and when the fetid smell has subsided, dress with white lead, thinly mixed with olive oil. When olive oil is not at hand, hogslard will answer or even dry white lead. If the disease is bad and has taken deep hold between the horn and sensible part of the hough, there is no remedy short of paring away the horn as far as it appears unsound, and cutting away the livid flesh, when apply the blue vitriol as above, until the fetid smell has subsided, when finish the cure with white lead. The sound flesh may readily be distinguished from the diseased, by the former's bleeding freely, and the blood and flesh having a bright and lively appearance, like a fresh cut in a healthy part of the body, whereas the diseased part will be of a greenish brown, or liver colour. At this season of the year, when the horny part of the hough is pared off, it will be necessary to put on a band made of sheep skin, and moderately tied with a woollen string, round the fetlock joint, to defend the hough from cold and dirt. The boot ought to be daily washed in strong soap suds, and every four or five days replaced with a new one. The sheep ought to be dressed every morning, and before each dressing, the diseased part ought to be

well washed with warm, strong, soft soap suds.—Prior to driving the sheep into the pen to be dressed, it will be well to sprinkle the pen over with slacked lime, to prevent the disorder being increased by contact with the infectious matter.—Much attention ought to be paid to the separating the lame sheep from the flock, and when cured, to their being taken from the lame flock. Attention ought also to be given to the cleanliness of their sheds, and that they do not run on wet ground. Sometimes lameness proceeds from cracks between the houghs, i. e. the skin which connects the two houghs together; but the milder type of the foot rot also often commences between the houghs. They are, however, easily distinguished from each other, for in simple cracks the hough retains its natural coolness, whereas foot rot is invariably attended with heat in the hough, particularly about the crown, i. e. the part between the horn and the hair. For simple cracks, soap suds and white lead are sufficient. One part oil of vitriol and three parts water mixed, is used by many instead of blue vitriol. Attention ought to be paid to cleaning the issues. Pure water and as much salt as they will consume are at all times necessary to the health of sheep."

OFFICIAL REPORT

OF THE

MASSACHUSETTS AGRICULTURAL SOCIETY.

Report on Cows and Heifers—Brighton Show, 1828.

The Committee on Cows and Heifers were much gratified with the show of those animals offered for premium the present year. They believe it has not been so good for several years past,—perhaps on no former occasion. This is much to say, when it is considered that since the first Annual Fair at Brighton, almost every county in the state has formed a Society of its own, where much stock is of course carried, which does not appear here.

The number sent for exhibition merely was probably less than usual, yet it was the less regretted, now, as the display of those offered by competitors was so imposing and respectable. It is hoped and expected, however, that gentlemen having animals of improved races will continue to send them hereafter for exhibition. It produces emulation, evinces a growing and commendable attention to a very important part of the duty of farmers, and serves greatly to set off this yearly test of improvement in things relating to agriculture. The Committee regretted that, among so many specimens of fine stock, of almost equal merit, nine premiums only could be distributed. There were thirty-seven animals, to which the particular attention of the Committee was called,—seventeen cows and twenty heifers,—and it may be truly said that nearly the whole of them were highly deserving of notice.

Mr John Lane Boylston, of Princeton, sent one cow, half Denton, and six of native stock. These with his fat oxen and his cattle for exhibition, together with his excellent butter, a large quantity, served very considerably to aid the Fair, and justly entitled him to the prizes he received. Other cows of native stock, beside those on which premiums were paid, were animals of uncommon merit.—Such were those owned by Messrs

Richard Richardson of Ashby,

Ephraim Randall of Stow,

J. W. Goodrich of Boston, whose cow was a descendant of the famous Oakes cow, tho' not her equal.

E. Crehore of Waltham

John Rube of Charlestown

Samuel Hastings of Princeton

Barney Atwood of Barre

Asa Wynan of Roxbury—owner of a fine young cow, going dry but four weeks

A. D. Williams of Roxbury.

Many cows and heifers descended partly from imported stock—such as Denton, Holderness, Cælebs, Admiral, and Fill Pail—were fine animals, and could not fail of attracting the public notice. They were owned by Messrs

Boylston of Princeton

Harrington of Princeton

David Stone of Watertown

Edmund Munroe of Boston

Jacob W. Watson of Princeton—owner of a heifer, one half Holderness, of uncommon promise.

John Whitney of Princeton

Henry Craft of Newton—his a beautiful heifer, 14 months old, one-eighth Cælebs.

Daniel Chandler of Lexington

Native heifers well deserving mention, were offered by Messrs

Horace Weston, of Lincoln

Sam. Hastings of Princeton

Edw. Sparhawk of Brighton

Daniel Leland of Sherburne

The Committee have thus given the names of the owners of this valuable collection of stock, because they deserve notice, and with the hope that should any of them wish to sell, it may be the means of finding purchasers.

As an encouragement to cattle shows it ought to be stated, as the Committee think it may be with great truth, that among the obvious advantages to our country from exhibiting imported stock, is the increased attention to our native breeds, as regards the selection of kinds, and the keeping. In this State and in others, it must be confessed that there was formerly great negligence in these particulars. But of late years the uncommon attention to imported stock, has elicited a spirit which extends itself to our native animals, and convinces us of what we before seemed ignorant, that discrimination in kinds, and care in rearing and feeding, rarely fail of being amply rewarded. This feeling it is to be hoped will be cherished in all suitable ways, throughout our highly favored country. Not only as regards neat cattle, but all those animals which contribute to the use and service of men. It is among the pleasing and obvious proofs of the growing wealth, refinement and happiness of a nation, that its inhabitants exceed, not only in the arts and sciences, but in everything relating to agriculture, that occupation which necessarily gives employment to far the greatest portion of every great independent commonwealth.

In awarding premiums the Committee were all agreed in giving the first of \$30, for the best milch cow, not less than three years old.

To William Osborn, Jr. of Salem. Mr Osborn's cow, of native stock, of middle size, about 7 years old, having no remarkable points, and of homely appearance, was proved to be an uncommon animal for the quantity and quality of her milk, and for the shortness of the time of going dry. The present and the former owners, having both kept particular accounts of her milk, were full in her praises. The milk was generally estimated by weight, and supposed to amount to

sixteen quarts a day for many months together, and the former owner stated in writing that the average quantity a day, was ten quarts from Jan. 9 to Dec. 1, of the year 1827.

To Benj. Harrington, of Princeton, the 2d premium of \$20. His cow was stated to be one-fourth Holderness, 5 years old, and to have given from 21 to 24 quarts a day for two months together. Mr Harrington exhibited another cow, not as a noted one for milk, but for her most uncommon size. She was 6 years old and weighed 1663 lbs.

To J. L. Boylston, of Princeton, the 3d premium of \$15, for a light red cow 4 years old, native stock, stated by Mr Boylston in writing "to have calved Jan. 7, to have given 14 quarts a day, of a rich quality, during the month of September, and to have been milked the year before, till within a month of calving."

For the best heifer having had a calf, the premium of \$15 was given,

To Isaac Robbins of Watertown. His was a heifer of native stock, two years old in April last, remarkable for one of that age, in having given from 17 to 11½ quarts of milk a day.

To John Goulding of Sherburne, the next premium being \$10. This heifer was 26 months old, one-fourth Cælebs, one-eighth Fill Pail, a very fine animal.

For the best heifer not having had a calf, the first premium of \$12.

To J. L. Boylston for a heifer, one-fourth Holderness, one year old.

To Henry Craft of Newton, the next of \$10, for a heifer 14 months old, one-eighth Cælebs.

To Daniel Chandler of Lexington \$8, for a fine heifer 2 years old, one-fourth Cælebs, one-eighth Denton.

To Zebedee Cook, Jr. of Dorchester, the last premium \$6, for his heifer 18 months old, one-half Admiral.

By order of the Committee, in the absence of the Hon. John Welles, the able Chairman,

P. C. BROOKS.

FOR THE NEW ENGLAND FARMER.

CONTRIBUTIONS TO ENTOMOLOGY.

BY THADDEUS WILLIAM HARRIS, M. D.

No. III.

GENUS FERONIA.

Subgenus *Omascus*.

The characters of this section of the the FERONIAE have not yet reached us; but comparisons with several European types enable us to indicate the following species. The first, only, appears to be apterous; the remaining ones are winged; in this respect agreeing with the European specimens. All of them (both native and foreign species) have the thorax somewhat heart-shaped, truncate at apex and base, and not quite so wide as the coleoptra; the dorsal stria is distinct, and dilated near the base; disc, near the basal angles, indented, punctured, and with two abbreviated impressed lines. The third interstitial line of each elytron has, generally, three large punctures; one, near the base, contiguous to the third stria, the others contiguous to the second stria, one on the middle and the third near the apex. In a few the basal puncture is wanting. The submarginal interstitial line is serrato-punctate within, the punctures approximated near the tip, and somewhat ocellated.

These species do not agree entirely with any of the descriptions by Mr. Say, though they approach to some of his *FERONIE* in the Philadelphia Philosophical Transactions. These insects are found under stones.

*O. *bisigillatus*. Black; posterior thoracic angles rounded, each with an annulated depression. Length eleven twentieths of an inch.

Body glabrous, black. Antennæ piceous toward the tip; palpi pale reddish brown. Thorax broadest just before the middle, lateral margin forming a regular curve, posterior narrower than the anterior margin; posterior angles not excurved, but obtusely rounded; lateral basal lines very much abbreviated, the external one obsolete, and between them is a deep, circular, punctured depression, with elevated centre. Striae of the elytra impunctured, basal dilated interstitial puncture wanting. Tarsi pale reddish brown.

*O. *subpunctatus*. Black, glabrous; thorax broadest before the middle, and gradually narrowed to the base; striae obsoletely punctured.

Length over half an inch.

Body glabrous, black. Antennæ entirely black except the tip of the terminal joint which is ferruginous. Palpi black. Thorax broadest considerably before the middle, behind which the lateral margin is nearly straight to the posterior angles, which are very slightly excurved and acute; posterior margin narrower than the anterior; base with the double lateral striae distinct but short, and vanishing in a rugose punctured depression. Elytral striae obsoletely punctured. Pectus and postpectus punctured at the sides. Feet black, tarsi tinged with piceous beneath.

*O. *politus*. Black, polished; anterior and posterior thoracic margins nearly equal, posterior angles excurved, basal indentations elongated, sparsely punctured.

Length over nine twentieths of an inch.

Body deep black, highly polished. Three basal joints of the antennæ black, polished, remaining ones fawn-colored and downy terminal joint pale ferruginous at tip. Palpi fawn-colored. Thorax broadest nearly in the middle; anterior and posterior margins almost equal, lateral margins regularly curved, at the base slightly excurved; posterior angles not prominent; basal lateral impression deep, with a few remote punctures, internal longitudinal striae elongated, dilated at base, external one obsolete. Elytra with minutely punctured striae. Pectus and postpectus punctured, the former inconspicuously. Tibiæ and tarsi pale piceous above, fawn-colored beneath.

*O. *hamatus*. Black, polished; basal thoracic lateral lines uniting into a hook; tibiæ and tarsi fawn-colored.

Length nearly two fifths of an inch.

Body highly polished, black with violaceous reflections. Three basal joints of the antennæ castaneous, polished, remaining ones fawn-colored, terminal joint at tip ferruginous. Palpi reddish brown. Thorax of similar proportions and shape as in *O. politus*; lateral indentations of the base rough with confluent punctures, each with two impressed lines, the internal one longest, curving outward near the posterior margin, and uniting with the very short external line so as to form a hook. Elytral striae minutely punctured. Pectus and postpectus punctured. Legs pale piceous, tibiæ and tarsi pale reddish brown or fawn-colored.

Subgenus Calathus.

In addition to the characters of the genus as

given by Latreille and Leach, it may further be distinguished from the other *FERONIE* by its pectinated nails, and from *LEBIA* and *CYMINDIS*, with which it agrees in this respect, by its broader subquadrate thorax. The feet are remarkably elongated, and the posterior pair are universally remote from the intermediate ones.

*C. *piceous*. Piceous; thorax, at the sides, and body beneath paler; antennæ and feet pale testaceous.

Length two fifths of an inch.

Body glabrous, polished, impunctured, above dark chestnut or piceous, beneath castaneous. Palpi and antennæ pale testaceous or ochraceous. Thorax subquadrate, narrower than the coleoptera at base, the angles rounded; broad external margin reddish brown; dorsal striae minute, basal indentations obsolete. Elytral striae impunctured, interstitial lines flat, the submarginal serrato-punctate within, punctures ocellated; lip of the elytra entire, rounded. Sides of the body, beneath, somewhat darker than in the middle. Feet pale testaceous.

It must closely resemble the *FERONIA gregaria*, Say, but differs in having a narrower thorax not pale at base, and with differently colored feet and antennæ. It has not the pale elytral margin of *F. terminata*, Say, nor the broad thorax of that species; and varies from *F. autumnalis*, Say, in many respects, besides being much larger, and having the tips of the elytra not sinuated. Sent by Rev. L. W. Leonard, from Dublin, N. H.

CIDER.

The subjoined specification of the manner in which Mr. Rice prepared his excellent bottled Cider, which was exhibited at the late Cattle Show in this town deserves particular attention. The process is cheap, and is very little more trouble than the ordinary mode of cider making.—*Concord Gazette*.

Among the various productions of our farms, none, perhaps, is susceptible of greater improvement, than that of cider. Although great quantities of it are annually offered in our markets, yet a large proportion of it is a comparatively indifferent quality. While it might afford a more agreeable and healthful beverage, if properly prepared, much of it now can be considered as scarcely palatable: And were it not for custom and use, much of it which is now drank, would be deemed useless, except for vinegar. Whereas, with a due degree of care and attention, it can be made equal if not superior, to the refined and costly drinks of a too common and pernicious use. Convinced that the above view of the subject is correct, I have endeavored for several years past to ascertain, by experiment, the best method of preparing cider to render it pleasant and agreeable; and at the same time a substitute, in a great degree, for spirituous liquors of a different description. From repeated trials, and various experiments, I have found that, to obtain the best cider, apples ought to be thoroughly mellow and wilted, and partly rotten, before they are ground. From rotten apples, I apprehend no evil consequences to my cider, but consider them a benefit, if they are not of a sour and musty kind; while from hard, unripe apples no good cider can be produced. To prevent as much as possible having many of unnaturally sour and musty rot, the apples should be seasonably gathered from the ground, and kept upon flat forms; and, after the first of November, they should be invariably housed. When they

are thoroughly mellow and fit for the mill, they ought to be ground in cool weather, and afterwards suffered to remain in the trough or unpressed for a week or ten days, if the weather be sufficiently cool to prevent its fermenting so much as to become acid; stirring the mass daily till it is put into the press. When the liquor is expressed, it should be strained through a tow cloth strainer, into a perfectly clean cask into which has been put two gallons of new Rum for a barrel. I say new Rum, because it is far the cheapest, and even preferable to six quarts of the best Cognac Brandy; and because it is best adapted for more immediate use, and communicates much less of its peculiar flavor to the cider, than any other spirituous liquor. After the cider is put up into casks, it should be kept as cool as possible, and without vent. Care, however, is to be taken, lest it burst the casks; to prevent this evil, a common gimblet hole should be made in the top of the cask, through which only vent is to be given as circumstances may require. In this situation the cider may remain till March; when it should be racked off, in a cool, clear weather, into clean casks; into which two quarts more of new Rum per barrel, had been previously put. Let it then remain ten or fourteen days, and it will be fit for bottling. For this operation also, cool and clear weather is indispensable. And when bottled it ought to be deposited upon the bottom of a cool cellar; the bottles placed about an inch or two apart, and covered with sand. By adopting this method, I have invariably had good cider; equal to any exhibited this day; and which has been universally approved by many taverns, retailers and consumers. Besides the course which I have stated above, I do nothing in preparing my cider for use, having found from repeated experiments, that the different processes recommended for refining are of no benefit, but generally injurious. I endeavor to gather and preserve my apples clean; to cleanse my straw and mill; to suffer no foreign matter of an offensive nature to affect my cider. And I am confident that, by pursuing the same course, the best of cider may be obtained. JONATHAN RICE.

Marlboro, Oct. 8th. 1828.

Gardens of the Town.—Sir, In my frequent visits to the metropolis, my attention, as a gardener, is often called to the little courts before the houses in the neighbourhood of town. They are generally clothed with grass, which is seldom well kept; and, indeed, as it is too small to be rolled, never looks neat and well. A better thing than this, in my mind, would be, to sow the whole with mignonette, and scatter a few larkspur seed among it; and, if plenty of crocuses, snowdrops, winter aconites, and Chrysanthemum indicum of different colours, were planted in them, the streets would look very gay, and yield a grateful perfume the whole year through. They would certainly be less expense to the owners, and, with barely weeding now and then, would look lively and gay ten months in the year.—*Gard. Mag.*

Adaptation of Fruit Trees to particular Soils.—It would be a very useful thing, if you were to direct the observation of your readers to the different soils which may be planted with advantage with some particular kinds of fruit, some of which, perhaps, are hardly supposed to be capable of producing any, as stiff clay, chalk, pure sand, wet bog, and morass. On the last, I beg to say, medlars, quinces, mulberries, raspberries, black currants and strawberries, will thrive to admiration.—*Id.*

AGRICULTURAL EXHIBITIONS.

The Committee of the Hampshire, Hampden & Franklin Agricultural Society on Animals, observed, that without exaggeration, it may be said that at no former meeting of the Society have so fine specimens of animals been presented. The number of animals having been, it is believed, twice as large as at any former period, and their appearance gave satisfactory proof that a great improvement is going on in these stocks within the limits of the Society. With regard to sheep, they remarked that some lots were exhibited which were very superfine, but that as good an exhibition of fine woolled sheep has been made on former occasions. Swine were uniformly good, and some extraordinary—far superior to former exhibitions. With regard to working cattle they say that many more of these animals were deserving of premiums than could be given within their power, and the same remark may be extended with great propriety to cattle fitted for the stall. Much cows were much superior to those presented on former occasions, and the Committee express their gratification that “our farmers are taking great pains in the selection of this part of the stock with reference to the *quality* of the milk produced, altho’ good keeping is found to be an important item in this particular, as well as in the quantity furnished. It is believed that those known among us by the name of the *Denton* and *Cor* breeds are to be preferred for the dairy.” They likewise commend the young stock, and say, “It is a well known fact that the best breeds in England have been produced entirely by selections of the best animals from their native breeds.” The *improved short horned* breeds have been in great demand in England; this is nothing but an improvement upon the Durham or Tees-water breed, formerly found in great numbers in the County of Durham.” The *Bukevell* and the *Collings* breeds are nothing but an improvement upon the native stocks of England, by the great care and attention of the distinguished growers of stock who have given names to these breeds, and it is ascertained beyond all controversy that “color, shape and quality can be given to stock by selections and crosses with almost as much certainty as the manufacturer can give them to the products of the loom.—We have in Massachusetts—we have in Old Hampshire, as pure blood, as sound bone, and as efficient muscle in our animals, as can be produced on either continent, and may we not believe that the period is not far distant, when, by the careful culture of our stocks, a race of animals will be here produced which will rival the best stocks in England? We trust we may yet hear of stock named from our river or our county, or some distinguished breeder within our limits, which will be sought after with all the eager and persevering enterprise by the farmers of Durham and the cultivators of land upon the waters of the Tees, that theirs have been sought for by the American farmer.” This report is signed by MARK DOOLITTLE, per order.

The Committee on Domestic Manufactures observed that “the collection of articles offered for premiums, exhibited, perhaps, less variety than on some former occasions. But in all the most important and substantial fabrics, and also in a certain class of costly articles, designed rather for ornament than utility, all of which have been too long sought from foreign sources it was rich and extensive. The exhibition, on the whole, shows

that domestic industry is regarded by this community as the best source of personal independence and general comfort.” Woollen cloths were superior to those of last year, but capable of improvement. It is recommended to die them in the wool. Two fine specimens of Scotch Plaids received premiums, and others of less worth drew small gratuities. Fewer dressed and undressed flannels were offered than at former exhibitions. Specimens of *Floor Carpeting* were spoken of in terms of decided approbation. “In conferring the premiums the preference was given for such as were well made, from the coarser material. If made with cheap wool, it is the more durable, and leaves the better quality of wool for its more appropriate uses. The piece of carpeting made by Mrs Cynthia Thayer of Greenfield, was made from wool of that description, costing only 12½ cts. per pound, and received the first premium. “This lady is deserving of great credit for the superior fabrics she has often presented at the annual fairs of this Society, and at the shows at Brighton. It cannot be doubted, that by the premiums she obtains, and by the sales of her goods, she is amply remunerated for all her labors. But more than this she deserves the gratitude of the community for having contributed greatly to raise the style of household manufactures. The like credit is due to Mrs Ann Meech of Worthington, whose fabrics have often graced the hall of the Society’s exhibitions.” The Committee speak of Cotton Counterpanes of a superior quality, Woollen Counterpanes, Rose Blankets, Hosiery, Stockings, Half Hose, Linen Sheetings and Shirtings, Linen Diapers, &c. Likewise two specimens of *Sewing Silk*. “The one the most perfect offered by Mason Shaw, Esq. of Belchertown, the other by Mrs Starkweather of Northampton. They were both superior in thread and colouring to the imported article; and procured gratuitous premiums.”—Corn Brooms and Brushes, Toast Irons, Waffle Irons and Bucket Ears, are also mentioned. The Committee conclude their report with advice to every family within the limits of the Society, to “Lay every hand to the work of Domestic Manufacture. Pursue it with steady and untiring perseverance. Let the sentiment and the word that govern in this good cause be *onward*.”

This report is signed by GEORGE GRENNELL, Jr. per order.

VEGETABLE DIET.

There cannot be a doubt that the diet of the Irish is highly favorable to vivacity and talent. It is stated in the Code of Health, that “vegetable food” has a happy influence on the powers of the mind, and tends to preserve a delicacy of feeling, a liveliness of imagination, and an acuteness of judgment, seldom enjoyed by those who live principally upon animal food. The latter is better calculated for those *who labor with the body*; but the celebrated Franklin ascertained that a vegetable diet, promoting clearness of ideas and quickness of perception was to be preferred by those *who labored with the mind*.

In proof of the assertion that a vegetable diet promotes clearness of ideas and quickness of thought, and that a transition from vegetable to animal food produces injurious effects, a friend states that he has more than once selected from his tenant’s children a boy remarkable for that smartness of intelligence so common in the Irish youth, while in the capacity of errand boys on the

farm, or helpers in the stables, and before they became pampered with better food than their parents’ cabin afforded. The lads at first were lively and intelligent, and displayed a degree of shrewdness exceeding what is generally met with from youths of a more exalted walk of life in England. But he invariably found that in proportion as these boys were better fed, they relaxed in activity, became dull and stupid; and he is confident that the change in disposition sprung from the effect of change of diet, and was not owing to corruption of mind from their intercourse with the other servants. In fact they lost all that vivacity of manner so inherent in the Irish boys, whether born in the vast bog of Allen, or in the dry and rocky counties of Mayo and Galway. He is therefore inclined to think that the character of the people does not depend so much upon climate or soil as upon food, for no part of the globe can differ more than these parts of that kingdom.

A potato diet is found greatly to improve the quality of the blood. Hence “roasted potatoes” have been successfully employed as a specific against the sea scurvy, when other remedies have failed. This discovery was made in France. It is singular that boiled potatoes do not seem to have the same good effects.—*Sir John Sinclair*.

IMPORTANT INVENTION.

We this morning examined and saw in operation a most ingenious and valuable machine for spinning flax and hemp, invented by Dr. Bell and Mr. Dyer, two intelligent and highly respectable gentlemen from New-England. They entered upon the prosecution of their plans last winter, and have now brought them to a successful termination.—As the patent has not been secured, we are not permitted to give a full description of the invention; but the following particulars will be interesting to our readers, especially to those who wish well to the cause of American manufactures.

The machine is constructed on an entirely new principle, having no analogy to the process for the cotton, woolen, worsted, or other manufacture. The quality of the yarns produced is pronounced by competent judges, to surpass other linen yarns in as great proportion as cotton or woolen yarns spun by the present improved machinery, are superior to those wrought by hand. The size of the thread can be varied to any extent, from that of cambrie to that of the rope yarns used in the manufacture of cordage. In the degree of velocity, its operation is limited only by the quickness which the spindles and fliers are capable of supporting. The instrument now in operation produces about the same quantity of thread per spindle, fineness being equal, as the *throstle spindles* in the cotton manufacture. The whole formation of the thread from dressed flax is completed at one operation.—The material laid on the machine is wound upon the spools ready for the loom, without the intervention of any assistance; the whole effected by the rotary motion communicated from *drums*.—Indeed, all the motions of the instrument are of a circular kind.

So far as our observations or knowledge extends, this invention is entirely original, and nothing of the kind exists in the work-shops of the United States or Europe, where the fabrics from flax are entirely wrought by hand. The manufactures of linens will now be placed upon the same ground and enjoy the same facilities as cottons. It has been estimated, that upon moder-

ate calculations *two millions of dollars* may be saved annually to this country by the reduced expenses of linen fabrics effected by this invention. If it be not introduced abroad, and foreign prices thus diminished, the products of our own looms will supply our markets and prevent importations from maintaining competition. Such is our impression of the importance of this machine. Those who are incredulous on the subject, may have their doubts removed by an examination of specimens of the thread at this office, or by inspection the machine at the corner of Pine and Water streets.—*New York American*.

From the Belkows Falls Intelligencer.

HEMP.

Below will be found a letter from Amos Parker, of Springfield, Vermont, to a gentleman of Charlestown N. H. upon the culture of Hemp, which is becoming highly interesting to our farmers. The experience which Mr. Parker has had in the business, who is a practical farmer of high reputation for integrity and sound judgment, will justify the public in placing a high degree of confidence in his statements, and at the same time correct a very erroneous impression, too prevalent among us, that hemp is what may be termed an exhausting crop.

Springfield Vt. Oct. 10. 1828.

SIR.—In answer to the questions you have been pleased to ask in relation to the culture of hemp, &c. I can briefly remark, that during the years 1813, 14 and 15, I sowed upon my farm about one acre of hemp: it was sowed upon what is termed meadow land, upon the Connecticut River, and was continued upon the same piece of land three years successively. There appeared to be no very essential difference in the several crops, either as to quantity or quality. It may be proper to remark, that during this time no manure was put upon the land. The great labor then required to water rot it in the stem, rendered the growing of hemp both expensive and burthensome and finally induced me to relinquish it altogether. From my own experience on the subject, I am fully satisfied that a hemp crop is *not what would be called an exhausting crop*, but may be successfully and profitably cultivated upon good land, with the same attention that we usually bestow upon our grain and other crops.

Under this conviction, and the additional inducements of obtaining a market for hemp without the process of water rotting, which is superseded by a newly invented machine for cleaning, I have engaged to plant a part of my land the ensuing season for the purpose of raising a crop of seed; in order to be in preparation to raise the lint the following season.

I am, Sir, &c.

AMOS PARKER.

Wire worm.—My dear Sir; According to the idea suggested to me in your letter, I have tried slices of potato, turnip, parsnip, and carrot, as bait for the wire-worm; and a thought having struck me that beet-root, from its saccharine nature, might attract them, I cut some up, as well as slices of the stalks of broccoli and other cabbage, to which, and the beet, they certainly give a preference. The destruction of the worm by this simple process, is astonishing. I find frequently two, three, and four attached to the bait, which I place on each side of the plant I wish to protect, about

two or three inches under the surface, with a small stick thrust into it, so that, in an instant, I can examine the spot. I feel most grateful to you for the hint, as, no doubt, by a little attention, I shall save my plants this season from certain destruction; as well as in the end, most probably, exterminate the worm altogether. I am, my dear Sir, &c.—*Gardener's Magazine*.

From a work entitled, "Seventy-five Receipts."

SWEET POTATO PUDDING.

A quarter of a pound of sweet potato; three eggs; a quarter of a pound of white sugar, powdered; a quarter of a pound of fresh butter; a glass of mixed wine and brandy; a half glass of rose water, and a tea-spoonful of mixed spice, (nutmeg, mace, and cinnamon.)

Pound the spice, allowing a smaller proportion of mace than of nutmeg and cinnamon. Boil and peel some sweet potatoes, and when they are cold, weigh a quarter of a pound. Mash them fine, and rub it through a sieve. Stir the butter and sugar to a cream. Beat the eggs very light, and stir them into the butter and sugar, alternately with the sweet potato. Add by degrees the liquor, rose-water, and spice. Stir all very hard together. Spread puff-paste on a soup plate—put in the mixture, and bake it about half an hour in a moderate oven. Grate sugar over it.

American Grapes.—About two years ago a gentleman of the name of Deininger, (then of this county) discovered on an island in the Susquehanna river, near the mouth of Conestogo, some bunches of what he considered a very fine grapes. Some of these bunches he brought to this city, and after examination, they were pronounced by all the gentlemen who had a knowledge of this kind of fruit, to be grapes of a very superior quality to any heretofore discovered in our country.—This season Mr. Deininger brought several bunches of these grapes to this city, some of which weighed about two pounds. They are of a purple color, grow very close together, the stone or kernel is very small, the skin thin, and the juice of a most delicious taste, and are pronounced by judges to be equal, if not superior to any foreign kind introduced into our country, and being indigenous, have nothing to fear from our climate.

York, (Pa.) paper.

The season.—"The summer has been generally wet here, and has continued so till Oct. Crops in general have been good, except wheat, which has been much hurt with rust and will be scarce." *Ryegate, Oct. 31, 1828.*

Robert Whitlaw, Esq. of Ryegate, Vt. raised *nine hundred good ripe beans, from one bean*, the past season; and one cabbage that weighed *forty three pounds*.

Presence of mind.—When Lee (the poet) was confined in *Bedlam*, a friend went to visit him, and finding that he could converse reasonably, imagined he was cured of his madness. The poet offered to show him *Bedlam*. They went over this melancholy medical prison, Lee moralising philosophically enough all the time to keep his companion perfectly at ease. At length they ascended the top of the building, and as they were both looking down from the perilous height, Lee seized his friend by the arm. "Let us take this leap;—

we'll jump down together this instant."—"Any man could jump down," said his friend, coolly, "we should not immortalize ourselves by that leap; but let us go down and try if we can jump up!" The madman, struck with the idea of a more astonishing leap, than that which he had himself proposed, yielded to this new impulse, and his friend rejoiced to see him run down stairs, full of a new project for securing immortality.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOV. 7, 1828.

METHOD OF DESTROYING THE MEALY BUG.

A writer for the *Gardener's Magazine*, Mr. JAMES ROLLINS, Liverpool, gives the following as an "effectual remedy for freeing the *Amaryllis* (lily) family of plants from the mealy bug which sometimes so much infests them. Dissolve one drachm of mercurial ointment in one ounce of neat's foot oil; with this mixture anoint the infested plants with a small painter's brush, allowing some of it to pass to the bottom of the leaves, and in among the scales of the bulb; and this, when thoroughly done, will kill or banish the insects forever, without at all injuring the plant."

DESCRIPTION OF A PORTABLE VINERY.

The writer above quoted states that "In order to have a crop of well ripened grapes in the open garden, without the expense of building a house for the purpose, I would recommend a glazed frame constructed of the cheapest materials, which I would call a portable vinery. It may be made circular, or a polygon of any number of sides;—about 3 ft. 6 in. in diameter, sides 4 ft. 6 in. high, and a roof finished off like that of a common hand glass. Any vine which happens to be growing on a south wall, or even a suitable branch of such a tree, may be taken from the wall, and trained spirally round a conical trellis fixed to the ground, and of no greater diameter or height than the glass case will conveniently contain. If a space of one foot be allowed between the trellis and the glass, it will be sufficient, and if the case were constructed in two parts it would be more convenient in putting up and taking down, and would also give more room and freedom in the management of the tree and fruit.

"Strong young vines, or other desirable fruit, planted on purpose for this mode of culture, would answer well; and, as I have calculated the expense of one at about 2s. 10s., a dozen of such cases, for grapes or other fruit, would cost much less than a house, which would perhaps not yield more than these portable frames. Strawberries on a conical stage would, no doubt, succeed well in this way; and, indeed, I am so thoroughly convinced of the utility of such erections, that I would even advise a row of them to be heated by hot water."

A Mr. Main, of Bath, observes that near sixty years since it was discovered that a waxy set of a partly ripe potato is less liable to curl than a mealy one. That a knowledge of this fact induced farmers to obtain their sets or seed potatoes from black or moorland districts, where it is necessary to take up potatoes intended for the next year's sets before they were ripe, and to harden them by exposure to the sun and air to fit them to be stored safely.

RHODE ISLAND CATTLE SHOW.

The Rhode Island Society for the Encouragement of Domestic Industry held their Show and Fair, at Pawtuxet, on the 21st and 22d inst. The Society was marshalled by Allen O. Peck, Esq. and an Address delivered by Hon. John Pinman. This production says the *Microscopist* "was strikingly characteristic of its author; plain, forcible, practical and pungent, and yet the "garbure" of poetry was not wanting to its embellishment, nor the refinement of a chaste and happy style in communicating sound thoughts. The discourse was listened to with great satisfaction for an hour. A copy was requested by the Society for publication. The services at the meetinghouse were impressively introduced by the Rev. Mr Farley of Providence.

There was a fine show of animals in the pens, and the collection of neat stock was "superior to any seen there for a number of years. Several noble bulls of high blood, showed the great pains that have been taken by our farmers to introduce the best imported breeds into this State. Forty-eight neat cattle, forty-six swine, twenty-nine sheep, eighteen yoke of superior working cattle, and ten colts were entered for premiums. Twelve bulls and six bull calves were exhibited, among the former the Durham, Holderness, Devonshire and Alderney breeds, the latter a bull formerly belonging to the Mass. Agr. Society, purchased by Mr J. C. Brown, and entered for exhibition. The cows presented nothing beyond the stock of any good farm, though fourteen were entered. A falling off of household manufactures is complained of "though there were some pretty things to admire, and some few substantial articles. Of the former a specimen of lace, with the manner of working its foundation and figure, a copy of a Flemish picture, a country house, and buildings, &c. manufactured of paper, with great labor.—Several filagree baskets and some other articles attracted the principal notice. But five articles of mill manufacture were presented. They were excellent in their several qualities.

In the dairy and agricultural products, the shop manufactures, &c. there was a better exhibition than usual; the butter exceeded any ever exhibited in the state. A specimen of screws manufactured at Olneyville, is recommended. Mr Hamlin's Solar Microscope was greatly admired. On Tuesday there were nearly four thousand people assembled to witness the ploughing match. Except the delay in commencing the work, the whole was conducted in the best possible manner. The competitors have learned that the race is not to the swift, and they went to work as steadily as if they had the day before them. The ground, though unfavorable was ploughed in a manner superior to any former match. Eighteen yokes competed for prizes, but one of which was without a driver.

Among the premiums was one to Samuel Low, of Warwick, for a lot of sewing silk, of various colours, manufactured in Warwick.

"The Committee would remark that the raising of silk is becoming a subject of great importance, and promises soon to form an important and extensive branch of Domestic Industry. They take pleasure in saying that among the able and useful works on this subject within a short period, is one by Mr William H. Vernon of this State, a copy of which has been presented to the Society. They would take the liberty of suggest-

ing the propriety of hereafter offering standing premiums for silk produced in this State."

The Committee on sheep and swine "noticed with pleasure the evident improvement in the exhibition of swine, of which there was an unusually large number entered, many of them good specimens of choice breeds. A gratifying evidence is thus afforded that through the influence of this Society in a great degree, the lank-sided, long-nosed, clamorous and ravenous race, that formerly exacted from the crib more than they yielded to the pork barrel, are fast disappearing, and giving place to breeds which, comparatively, have the faculty of almost fattening themselves, besides furnishing a delicacy in their flavor as much superior to the flesh of the long legged vagabond hog, as the butter of New England is to the substitute used by the New Hollander. The pork barrel, is one of the most important items in the provision of a small or large family; and the economy of supplying it with the best material and at the cheapest rate, probably involves the direct interest of a larger number of persons than the raising of any other description of domestic animals. It is surprising, therefore, that when a good breed of swine will consume so much less and yield so much more than an indifferent one, that the latter should have been suffered so long as it has been, to disturb the domestic quiet of the farm yard, by an incessant clamor for food which satisfieth not, and after all seems to be totally absorbed in elongating the ears, legs and nose of the ungrateful animal. Your Committee, therefore, recommend to every person, who owns a sty, to take especial care what occupants he suffers to take possession of it."

The following certificate was produced relating to the Geese imported from Friesland.

This may certify that in the fall of 1827, I imported from East Friesland to this country, a pair of geese, for James Sisson, Esq. being, I believe, a different kind from any heretofore imported from Germany, and a much superior and improved breed. Another important thing (in my opinion) that adds to their value besides their size, is the great quantity of feathers they produce, which are an article of exportation from that country. These feathers in Germany, Holland and England, are considered the best of any that come to those markets, and command a better price.

CHRISTOPHER CHILDS.

Warren, June 28, 1828.

Among the Agricultural Experiments were a premium awarded to Abner Sprague, of Cranston, for the best specimen of cider, \$8. "Good judges might have mistaken this for cider of the best Jersey manufacture." A premium of \$3 was awarded to N. Bartlett, for a beautiful specimen of celery, from the garden of Philip W. Martin, Esq. of Providence.

To Eshon Sherman, for several bushels of Sweet Potatoes, raised in Warwick, some of them weighing more than two pounds, a premium of \$8.

GATHERING AND PRESERVING ROOTS.

A proper place to deposit roots in is among the pre-requisites for their preservation. Loudon says "the root-house is used for storing up or depositing potatoes, turnips, carrots, cabbages, or other roots or tops for the winter food of cattle. It should always join the cattle sheds, and communication with them by an inner door that opens into the feeder's walk along by the heads of the cat-

tle. The entrance door ought to be so large as to admit a loaded cart. These houses are essentially necessary, wherever there is a number of cows or other sorts of cattle, to be supported on roots of the carrot, parsnip, turnip, and potato, kinds, as well as for cabbages, as without them it would not only be inconvenient, but in many cases, in severe weather impossible to provide them for the daily supply of such stock. Cabbages should not, however, ever be kept long in houses, as they are very apt to take on the putrid fermentation and become useless. The master should be careful that the yard-man constantly keeps such places perfectly clean and sweet, in order that the roots may contract no bad smell, as cattle are in many cases extremely nice in their feeding, and when once disgusted with any sort of food, seldom take to it again in a proper manner." Mr. McMahon's mode of preserving roots is as follows: "Previous to the commencement of severe frost, you should take up, with as little injury as possible, the roots of your turnips, carrots, parsnips, beets, salsafy, scorzonera, Hamburgh or large rooted parsley, skirrets, Jerusalem artichokes, turnip-rooted celery, and a sufficiency of horse radish for the winter consumption; cut off their tops, and expose the roots for a few hours, till sufficiently dry. On the surface of a very dry spot of ground, in a well sheltered situation lay a stratum of sand two inches thick, and on this a layer of roots of either sort, covering them with another layer of sand, (the dryer the better) and so continue layer about of sand and roots till all are laid in, giving the whole on every side a roof-like slope; then cover this heap or ridge all over with about two inches of sand, over which lay a good coat of drawn straw, up and down as if thatching a house, in order to carry off wet, and prevent its entering to the roots; then dig a wide trench round the heap, and cover the straw with the earth so dug up, to a depth sufficient to preserve the roots effectually from frost. An opening may be made on the south side of this heap and completely covered with bundles of straw, so as to have access to the roots at all times when wanted for sale or use.

"Some people lay straw, or hay between the layers of roots, and immediately on the top of them; this I do not approve of, as the straw or hay will become damp and mouldy, and very often occasion the roots to rot, while the sand would preserve them sweet and sound.

"All these roots may be preserved in like manner in a cellar, but in such a place they are subject to vegetate, and become stringy earlier in spring. The only advantage is, that in the cellar they may be had when wanted, more conveniently during winter, than out of the field or garden heaps.

"*Note.* All the above roots will preserve better in sand than in common earth, but when the former cannot be had, the sandiest earth you can procure must be dispensed with."

In gathering roots, of the mangel wurtzel, or other beet, it is recommended to cut off the leaves about half an inch above the crown, as they will not keep so well, if cut more closely. Messrs. Teistran, and Henry Little, of Newbury, Mass. in an account of their premium crop, state that "as the best mode of preserving them we have tried divers ways;—by pitting them—by putting them into a barn, and covering them with hay, and by putting them into the cellar; the last

mode we think the best." Col. Powel observes, that "one of his crops was piled in a cellar, in rows, as wood, and covered with sand." A writer in the *English Farmer's Journal*, observes that he has practised with success the following mode of preserving this root: "I pack it in long heaps, about seven feet wide at the bottom. I begin by forming the outside with the roots, not stripped of their tops; tops outwards; the internal parts to be filled with roots without leaves; continue one layer over another, until the heap is about six feet high, and about two feet broad at top, which may be covered in the same way; the leaves form an efficient covering against rain and frost."

Arthur Young says that the best way of storing potatoes (and no doubt the method would answer for other roots,) is in what are called potato pies. "A trench one foot deep and six wide is dug, and the earth clean shovelled out, and laid on one side; this has a bedding of straw, and the one-horse carts shoot down the potatoes into the trench; women pile them up about three feet high, in the shape of a house roof; straw is then carefully laid on six or eight inches thick, and covered with earth a foot thick, neatly smoothed by flat strokes of the spade. In this method he never lost any by the severest frosts, but in cases of freezing with uncommon severity, another coat over all gives absolute security."

In Rutlandshire, Marshall says, the method of laying up potatoes was universally that of camping them; a method somewhat similar to the above, but which requires to be described. Camps are shallow pits, filled and ridged up as a roof with potatoes, which are covered up with the excavated mould of the pit. This is a happy mean, he thinks, between burying them in deep pits and laying them on the surface.—Camps are of various sizes, being too frequently in a long square form, and of a size proportioned to the quantity to be laid up. It has, however, been found by experience that when the quantity is large, they are liable to heat and spoil; much damage having been sometimes sustained by this imprudence. Experienced campers hold that a camp should not be more than three feet wide; four feet is perhaps as wide as it can be made with propriety, proportioning the length to the quantity, or if this be very large, forming a range of short ones by the side of each other. The usual depth is a foot. The bottom of the trench being bedded with dry straw, the potatoes are deposited, ridging them up as in measuring them with a bushel. On each side of the roof long white straw is laid neatly and evenly as thatch; and over this the mould raised out of the trench, is evenly spread; making the surface firm and smooth with the back of the spade."

Many roots have been lost by mismanagement with regard to two particulars—1st. They are too frequently deposited in such large masses as to become heated and spoiled by fermentation. And, 2dly, They are sometimes so placed for winter keeping, that water penetrates into the pit, camp, or hole, in which they are deposited, and their deterioration if not decomposition is the consequence. Attention to the foregoing remarks may be the means of preventing the experienced cultivator from falling into either of those errors.

Corn husks for beds.—As soon as they are ripe the husks should be gathered when they are dry and in a clear air. The outer hard husks are to be rejected, and the softer inner ones to be fully dried in the shade. Cut off the hard end, former-

ly attached to the cob, and draw the husk through a betel, or suitably divide it with a coarse comb. The article is now fit for use—to be put into an entire sack, as straw is, or to be formed into a mattress as prepared hair is. Any upholsterer can do the work. This material is sweet, pleasant, and durable. They are used in the southern and middle States, and in Spain and Portugal.

ASPARAGUS IMPROVED BY IRRIGATION.

W. J. Foster, a correspondent for the *Gardener's Magazine* asserts that although writers on the cultivation of asparagus generally recommend a dry sloping situation he has succeeded in circumstances directly the reverse. That some beds of his, which were completely flooded from the 1st. of October to the middle of February to the depth of from 6 to 12 inches proved unusually productive. He is of opinion that the cultivation of this vegetable may be improved by intentional flooding. Mr. Main observes on this that "We are all aware of the effect of irrigation on meadow land; the liquid covering which excludes the air and not the light stimulates the vegetation surprisingly, it being only a denser medium, in which perhaps, the principal food of plants exists, and where no other quality necessary for them is wanting.—When motion to the water, also, can be given it is an additional advantage; and now, since the discovery of forming fountain wells, by which small, never failing streams of water can be procured [we should be glad to hear something more of this discovery] and carried in any direction, we really think it within the bounds of practicability to force asparagus, and perhaps several other plants by means of water only. It has also struck us that Mr. Foster's experience accounts most satisfactorily for the superiority of the Gravesend, Deptford and Battersea crops of asparagus, the alluvial banks of the Thames being so near an approach to the circumstances mentioned by our correspondents.

Wanted.

On a farm in Roxbury a young man who has a knowledge of farming and can bring recommendations for industry &c. Apply at this office. 31. Nov. 7.

Bor.

For sale a quantity of superior Box. Any person wishing for a small quantity, or sufficient to edge extensive walks or avenues, may at the present time, procure it on the most reasonable terms, by applying to Messrs. Winstons' Nursery, Brighton Nov. 7, 1823. 31.

FRESH SEEDS AND ROOTS.

Field Peas.

A consignment of 50 bushels of Field Peas, from Vancouver, of the growth of 1827, in good order. They will be sold by the tierce at \$1.75 per bushel.

Grape Vines.

On hand, well packed in moss for transportation, a good collection of Grape Vines, at the nursery prices, 50 cts. to \$1.60 per root.

Thorn Quicks for Hedges.

A few thousand Buckthorns and Hawthorns. The latter were imported from Glasgow last spring, and are in fine order for transplanting, \$5.00 per thousand, 75 cents per hundred. We are now filling up an order for Georgetown (D. C.) for several thousands of the American Thorn, which will be delivered here at \$5 per thousand for seedlings; \$6 for plants two years old. Persons in want of this valuable thorn for live hedges are desired to transmit their orders soon.

Tangier Cauliflower.

We have just received through Mr. Malony, the American Consul at Tangier, a few lbs of this celebrated Cauliflower seed. A small parcel was sent to the Hon. Jonathan Humphreys of this city, a few years since, who pronounces it altogether superior to any seed from England, and a high produced cauliflower much finer than any he had seen cultivated in this country.

Pressed Herbs.

Sweet Marjoram and other culinary and medicinal herbs, pressed, and packed by the Canterbury Shakers, at their prices.

Seed Potatoes.

A few bushels La Plata or Long Red Potatoes, raised by Mr. Gourgass of Weston; selected for seed, of a uniform size, and much improved as to their earliness, by the careful attention of Mr. G. Also a few of the very superior Irish Whites Potatoes.

Orchard Grass Seed.—Flint Wheat, &c.

A further supply of Orchard Grass Seed—growth of 1823. Two hundred pounds of Red Onion Seed. A few bushels White Flint Fall Wheat, commonly called Chual Wheat.—Also, Gilman Spring Wheat.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladioli, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

The collection of LILIES is very splendid, comprising Scarlet Chalcedonian Lily 50 cts. Orange Pomponne Lily 37 cts. Chinese Leopard 25 cts. Orange Martagon 37 cts. Yellow Martagon 37 cts. Double Violet Flamed 37 cts. Purple and White Spotted 37 cts. Bright Scarlet Pomponne 50 cts. Double White 37 cts. Large White Garden Lily 12 cts. Dwarf Chinese Red Lily (*Lilium comode*, new and very superb one root only) \$1.50. HYACINTHUS—(double and single)—dark blue, porcelain blue, red and rose coloured, pure white, white with yellow eye white with rosy eye, and yellow with various eyes; from 25 cts to \$1.00 each.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots, 3 cts. each.

JONQUILLES—very selected, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 38 cts. each.

DOUBLE NARCISSUS—fragrant, of all colours, 19 cts. each. SPRING CROCUS—of all colours, 6 cts. each, 50 cts. per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bulbs 1 inch and 2-1/2 inches in diameter.

Purchasers are requested to notice that the above roots are *not purchased at auction*, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the more refuse of the most inferior collections, and roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

Also pots for blooming the Crocus, in the shape of Bed tubs, Porcelain Drier-work Flower Baskets, (very beautiful) Beehive Flower Pots, Half moulds, Cones, &c.—a new article. A few roots of Wilmot's Superb Strawberry.

Just received at the

New England Farmer Seed Store.

No. 52 North Market Street—Boston.

All orders faithfully executed.

Standing Presses, &c.

The collection has for sale, Standing Presses for Printers, Bookbinders, &c., and furnishes at short notice those of greater or less power. He also has for sale Composition Rollers, Tables, &c. at very reasonable prices. Printers' Ink as usual.

ROBIN PAKER, corner of Corner and Water streets.

Grape Vines.

The subscriber offers for sale Grape Vines of several varieties, the produce of his garden in Dorchester; among them are the following:

Isabella	White Muscat
Black Hambro	Black Hamburg
Black Cape	Elba
Queen	Muscate
Early Oval	Alexander's or Schuyler

They are principally of one year's growth, planted under his direction, and superintendence, are warranted genuine, and are in a healthy and vigorous state.

The subscriber proposes to continue the cultivation of such varieties of the foreign and native vines as are suited to this climate, and that will thrive in the open ground in town or country.

Application may be made to the subscriber, at his office, No. 7 1-2 Cornhill Street, or at the Garden, to Patrick Kennedy Boston Oct. 3, 1823.

ZEPHED COOK, Jr

MISCELLANIES.

On the duty and value of punctuality.

One of the inconveniences I experience here is the want of punctuality. Among merchants it is a cardinal virtue—but does not appear to be much known in the country, where farmers “most do congregate.”—“Why do you dun me? is not your money safe?—I will pay you when convenient.” Such, too often, are the answers the needy trader or mechanic receives from the man of lauded estate—proud of his possessions, and abounding in every thing but ready money, of which he seldom feels the want, and therefore, cannot realize the want in others differently situated. He has his beef and pork, and mutton, and poultry—his hay and corn, and wheat and rye—every thing but coin. He lives like a prince, and too often feels like one towards those who want such advantages. A man of this kidney will live in decent credit, as a kind neighbor and honest man, altho’ his creditors go without their money for years together. A man of this kind, a sort of feudal lord, appears to be a privileged person. His neighbors are shocked at the idea of suing him for a debt, although it is the only way of getting payment. It appears to me unjust to withhold from the man who has bestowed his labor on my farm, or spread his groceries on my table, or clothed my domestics and children, his just dues. It is a positive act of *injustice*—and yet we find men not only of quiet conscience under such circumstances, but offended if asked to pay a debt—consider themselves ill used, and in a passion declare they will not pay until compelled. I have seen, and wondered at such conduct—for I was reared among commercial men, before the mania of speculation broke out, when a failure in an engagement to a day—nay, an hour, was *dishonor*.

One of my rich neighbors, who keeps his coach, his horses, and hounds, and entertains company all the year round, never pays a debt except through the medium of the sheriff. I am happy to know two of his creditors—it will be sufficient to single out two. One his overseer—the other a female weaver. These poor people have worked for him for years without compensation, and with but little chance of any. And yet no one ventures to say he is *dishonest*!

I lately attended a vendue, where goods and chattels were going off under execution. Every one was pitying the debtor, whose property was thus under sacrifice, but not a man sympathized with the creditors, (some of whom had been almost starving for years) for the want of their dues, withheld by this unjust and unfeeling man. I felt indignant, and only regretted that the law’s delay had been so great. Why pity him? He had put it off as long as possible. The law, though slow, had at length overtaken him, and was wrenching from his firm grasp property unjustly in his possession, to give it to the right owners—and I felt glad of it, although it broke up a man of some figure.

I have no kind of objection to coaches, hounds, and horses, where they are supported by proper means; but I have no patience with a man who indulges in such luxuries while his creditor has to walk (perhaps barefoot) and go supperless to bed, merely because he, or his wife, has a *taste* for them, or that their neighbor, who can afford it, keeps such things. It is not *honest*.

But “let us return to our mutton.”—“The punctual man is lord of his neighbor’s purse.” I know

a man who established a character for punctuality by borrowing small sums, and without using them, returning them punctually at the time appointed. The character thus acquired, enabled him afterwards to gain a fortune. But a man of experience has only to cast his eyes around to see how important it is—how universally the *punctual, fair dealer*, has succeeded in life; and how the *tricky, cunning man*, has failed. There are some exceptions, as we sometimes hear of robberies never detected.

If a man borrow money he should pay it on the day fixed—using no excuse—as, “that it rained and he could not come out; that he had been disappointed in his collections, or that wheat was too low, and he could not sell at a sacrifice; or, that he did not suppose a *few days* would make *much odds*.” He who makes such excuses knows nothing of the nature or importance of my subject. I often think of the conduct of a worthy man, whom I once knew to walk four miles to pay his more opulent neighbor as many pence due, in change, on a late settlement. “Such an act may appear to some of your young readers as one of great simplicity and folly—mean spirited—and that such a trifle should have been *forgotten*.” It certainly evinced simplicity—the simplicity of virtue—and I doubt not it was the best day’s work he ever did—for it went far towards establishing a character for honesty and punctuality.

I have known several young lawyers succeed in practice with little else to recommend them, while their cotemporaries, of ten times their talents, failed of success for the want of this virtue. They were not only punctual in paying over the sums collected; but in their attendance at their offices—at the courts, and wherever business and duty required them to be.

I once took great pleasure in dining at a particular tavern—my host was entirely to my taste. The first dish was invariably placed on the table by his own hand while the clock was striking the hour of two. He would not have waited for Gen. Washington himself, who, by the bye, would not have expected him to do so: for, he himself, was of this family—punctiliously punctual. But, while I recommend punctuality, I am far from advising running in debt in any way—it is a rock on which many young men are wrecked. “Borrowing dulls the edge of husbandry,” and any one addicted to it, is a troublesome neighbor. *Candor and fair dealing* are virtues of the same stamp. “*Honesty is the best policy*,” whatever the speculators and horse jockies may think to the contrary.—*Am. Far.*

Shopping.—An American in England went to hear the celebrated Rowland Hill preach, and heard him tell the following story in the pulpit: Speaking of *patience*, he said he would tell us a story. “I once went into a shop where there was a clerk, a very pious, godly young man; and while I was there, he was obliged to haul down goods in piles from the shelves, and spread them out, and then lay them away again, and pull down more; and all for nothing in the world, but to gratify the curiosity and caprice, of a parcel of idle, gossiping customers, who didn’t want to buy any thing. But I must tell you, by the way, that this practice is very rude and uncivil. Some people don’t care how much trouble they give. They’ll go into a shop, and have piece after piece taken down and unrolled; when they don’t want

to buy a farthing’s worth. I’ll tell you what, it’s very rude and vexatious—I’d have you learn *good manners*. Well, seeing how much unnecessary trouble the young man was put to, I said to him, these people make you a great deal of labor—you must find it very vexatious to wait on such unreasonable folks. ‘O no,’ he said;—‘it does me good—it teaches me the grace of *patience*.’”

Ladies who are fond of going *a-shopping*, may as well read over the good preacher’s chapter on *patience*, a second time.

Fly Water.—Prussic acid has been obtained from the leaves of *green tea* in so concentrated a state, that one drop killed a dog almost instantaneously. A strong infusion of Sonchong tea, sweetened with sugar, is as effectual in poisoning flies as the solution of arsenic generally sold for that purpose.

*Fruit Trees.*

WM PRINCE, the Proprietor of the Linnaean Botanic Garden and Nurseries at Flushing, Long Island, has the pleasure of informing the public, that his Nursery now contains 172 varieties of the Apple, 202 do. of the pear, 76 do. of Cherries, 139 do. of Plums, 52 do. of Apricots, 84 do. of Peaches, 29 do. of Nectarines, 10 do. of Almonds, 14 do. of Mulberries, 6 do. of Quinces, 16 do. of Figs, 16 do. of Currants, 15 do. of Raspberries, 47 do. of Gooseberries, 20 do. of Strawberries, 257 do. of Grapes, 600 do. of Ornamental Trees, &c. Above five hundred of the above kinds of Fruits are not to be found in any other collection in America. The different varieties cannot otherwise than genuine, as the greatest attention is paid, and nearly all the kinds are inoculated from bearing trees. The Cherry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of J.R. Newell, at the Agricultural Warehouse, No. 52 North Market-street, gratis; and orders left there, or sent by mail, will meet prompt attention. Oct. 32.

Wilson’s Nursery, Derry, N. H.

The proprietors inform the public that their nursery offers peculiar facility for the acquirement of useful fruit; more than fifty thousand trees now cultivated by them consisting of a great variety of Apples, Peaches, Plums, Cherries, Quinces, &c. embracing most of the celebrated and esteemed kinds in this country. The utmost care has been observed by the original proprietor for more than thirty years, in making the selection and the whole is now offered as containing none but the most worth of cultivation. Persons not acquainted with the different kinds by name, who wish to procure choice kinds, by stating the time they wish them to ripen, may confidently trust to the proprietors without fear of disappointment. All orders will be promptly attended to, and trees furnished at their nursery, this fall or next spring, at the following prices.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Sausage Machine.

Orders for the Sausage Filling Machine, (post-paid,) sent to the Agricultural Establishment, No. 52 North Market Street, Boston, or to the subscriber, will receive prompt attention. Dorchester, Oct. 23. JOHN MEARS.

One of the machines is left at the Agricultural Warehouse for examination.

Gunpowder, &c.

Du Pont’s Gun Powder, at 25 to 50 cts. per pound—Shot—Balls—Flints and Percussion Caps. Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the *Du Pont Powder Store*, No. 65 Broad street—By E. COPELAND, Jr.

The Du Pont sold as above, is warranted first quality—and is marked “E. Copeland, jr. Boston,” on the head of the cask. March 14.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

ON THE IMPROVED BREEDS OF CATTLE.

MR FESSENDEN—Many of us have been disappointed, and some of us, who have sent cows from a distance, greatly to our inconvenience and loss, by the decided impotence of the imported bull *Bolivar*, owned by Col. POWELL, and kept by Mr JAMES of Charlestown. I have no skill in judging of stock of this kind; and it would require none to see that this noble animal in his appearance and external properties has never been surpassed nor equalled among us. Several competent judges have pronounced him the finest animal ever brought into the country.

It is matter of great regret, therefore, that he is incapable, at least in his present condition, of propagating his species. That the proprietor of this superior animal could have been aware or even suspicious of this deficiency, no person, who is acquainted with this intelligent, public-spirited and most liberal patron of every agricultural improvement, can for a moment believe. It is impossible: and my present object is to show that the result in this instance is not extraordinary in regard to such high bred animals; and to leave it to others to account for, or discuss this fact, which seems to be well known among distinguished breeders.

I will quote from some letters of the Rev. HENRY BERRY, one of the most eminent agriculturists in Great Britain, on the subject of the Improved Breeds of Cattle, published in the British Farmer's Magazine.

In the No. for May 1827, quoting from MARSHALL, he says, "It is observable that the bulls of this improved breed are not unfrequently, even while youthful, deficient in vigour, the hired bulls being sometimes returned prematurely on this account." &c. &c. &c.

Then again in the same letter he observes—I must in this place quote Sir JOHN SEBRIGHT; he observes, I have tried many experiments by breeding *in and in* upon dogs, fowls and pigeons; the dogs became from strong spaniels weak and diminutive lap dogs; the fowls became long in the legs, small in the body, and bad breeders." The want of vigour in BAKEWELL's bulls, and in many high bred ones of the present day, I ascribe to the cause, which produced the same effects in the objects of Sir JOHN SEBRIGHT's experiments. In the unimproved stocks of the country we hear of no bulls refusing to serve cows; and seldom a heifer that will not breed; but in the improved races these facts are of every day's occurrence; not only, be it remembered, among animals highly kept, but in such as have experienced no indulgence whatever; and but too many of them are indeed what Sir JOHN SEBRIGHT describes his fowls to have become, long in the legs, small in the body, and bad breeders.

In the No. for August, 1827, he says, "But how shall we account for impotence in the male, and barrenness in the female, which so commonly arise out of this system [breeding in and in] when such failures were totally unknown in the ancestors?"

Surely such affection must be strictly constitutional; and if so, it offers us a warning not to be disregarded. On this point as respects swine, I am enabled to speak positively. I have long possessed a valuable breed, producing frequently, and sufficient numbers in a litter, and also attaining a desirable size. By breeding in and in, I gradually lost size and number, till some sows produced only one, while others never evinced a desire for the male, and the few young ones I could obtain were seldom, or with difficulty, reared. Valuing highly the fattening properties and form of this breed I retained and still possess some of the sows, which I have crossed. The result is striking and strongly to the point. They continue to produce few at a litter; but this produce, which is from the cross, I rear without difficulty, and they bring as many pigs as ever I obtained when my breed was unaffected by the practice which has almost ruined it."

These observations and facts, Mr Editor, appear to me of great importance. I pretend to no practical skill or knowledge in the case; but I have always felt a particular interest in fine animals of every description, from even a glow worm or a butterfly to that most attractive of all the Creator's works, a beautiful woman, flushed with the bloom of youth and health, buoyant in innocence and cheerfulness, and with a countenance radiant with genius and intelligence.

Everything relating to the improvement of our domestic animals, is so connected with our agricultural improvement and prosperity, that I make no apology for this communication; persuaded that if it should contribute to exact and intelligent experiments and observation; or call forth a discussion of the general subject, among those who are experienced and competent, it cannot fail to be of public utility. Yours respectfully,

Nov. 7, 1828.

A. Z.

ON PREMIUMS FOR STOCK.

MR FESSENDEN—In looking over the report of the Committee at the late Brighton Show on Cows and Heifers, some doubts have occurred to me as to the propriety of the course, which they have adopted in bestowing their premiums. I have entire respect for the impartiality and good judgment of the gentlemen, who composed the Committee; and according to the rules which have always been followed, do not think they could have decided differently; but my difficulty is with the rules themselves.

The object of the premiums in this case, I understand, to be the improvement of our Live Stock. How this is to be effected by rewarding the man, who is by accident the owner of a fine animal, who has taken no pains in rearing her, and is under no obligations to raise her progeny, I do not well see. The owner of the cow, who obtained the first premium, came by an accidental purchase into possession of her less than a year ago. She was then of full age, and the previous owner selected her by chance from a drove of cattle, without any knowledge of her good qualities. There was nothing in her appearance to recommend her, as the Committee allow that she had no remarkable points whatever, and was a home-

ly animal. She it seems has given an extraordinary quantity of milk, averaging ten quarts a day for more than ten months; and of a superior quality, though I could not learn from the report, by what evidence this latter fact was established.—The Committee give no statement of any measurement of her cream or any amount of butter produced by her. The quantity of her milk was certainly extraordinary among us;—yet still I am at a loss to know why the accidental owner of such an animal, let her be ever so distinguished, should be rewarded with a premium for the Improvement of Live Stock. How is that end to be promoted, if nothing more is requisite than that he should present the animal at the Show.

My opinion is, that such a premium should not be bestowed, excepting where the owner has shown either particular skill in the selection, or particular care in the raising of the animal;—and will give security to the Trustees that he will (extraordinary accidents excepted) raise one or more of her progeny. Suppose for example, in case of obtaining the first premium of thirty dollars, fifteen or twenty dollars should be paid at the time; a bond should be taken that the owner rear the next calf; and the balance of the premium should be paid to him, on his exhibiting such calf at least a year old, at the Brighton show. This, which I by no means suggest as the best mode, would certainly conduce much more to the objects of the premium than the course now pursued.

In the present instance, the last calf, which this cow produced was sold, I understand, to the butcher; and she has been sent the present season to an ordinary bull; as the owner has no object but to make the most from the sale of her milk.

I beg leave through your useful paper to suggest these considerations to the Trustees of the Society, to whose enlightened, disinterested, and patriotic services, no one bears a more grateful testimony than

Your obedient servant,

Nov. 12, 1828.

A. Z.

REMEDY FOR CANKER WORMS.

MR FESSENDEN—In reading some weeks since in the New England Farmer, a description of "an apparatus for protecting trees from the ravages of the canker worm," I was reminded of a plan that I once formed, which is somewhat similar to the one invented by Mr Houghton.

If in your opinion it promises to be of utility, you will please to publish it in your valuable paper.

My plan is to place around the trunk of the tree a small quantity of earth, or what would be preferable, compost manure, upon which and around the tree is to be placed a square, wooden frame in which is cut a trough or channel, an inch in width to be filled with lime-water. The spaces between the frame and tree are to be filled with clay mortar. Nothing further is necessary than to keep the trough full, or perhaps to remove the grubs that might fall therein. In my opinion the final expense would be less than that of tarring, as the frame can remain, if necessary, several

years, provided a sufficient allowance is made in their dimensions, for the growth of the tree. The joints of the frames can be filled with tar to render them water tight. II.

Westboro' Nov. 6, 1828.

Mr FESSENDEN—Having broken the spear of my pump, about 4 feet from the brake, the upper box fell so that it rested on the bow of the lower; consequently the top of the spear which is of $\frac{5}{8}$ square iron, was 4 feet under water. *Query*.—How could the box and rod be extracted by any process short of hoisting out the pump?

A SUBSCRIBER.

SOLUTION.

The mode adopted was as follows—I took a dry Spruce pole, secured the end by a ferrule, bored a hole of sufficient size to admit the end of the spear, put it down on the end of the spear, held fast the pole in my hand, driving it as in the act of inserting an axe or hammer handle to prevent the box from being injured by the bow of the lower box—let it remain in the water a few minutes to swell, then draw the whole gently forth. M.

MERRIMACK AGRICULTURAL SOCIETY.

On the 15th and 16th of October, the 5th Annual Cattle Show and Exhibition of Household and Domestic Manufactures, for Merrimack county, N. H. was held at Loudon village. The exhibition was well attended, notwithstanding the roughness of the weather. The exhibition of domestic manufactures, though not so large as on some former occasions, was highly respectable;—and indicated an evident improvement in many branches of household industry. The specimens of carpeting were numerous and handsome. Some of the pieces would not suffer in comparison with the best imported Kidderminster. The specimens of various other articles of manufacture were of good fabric, and worthy of commendation. Elegant samples of needle work, handsome counterpanes, one in particular very superb; two finely wrought bonnets, fabricated of the common spear grass, excelling in beauty many of the finest Log-horns. Specimens of native silk, excellent garden vegetables, a Carolina or sweet potato, which with several others were raised by Gen. Isaac Eastman, of Concord, a cotton plant by Mr. William Francis, of the same place, and fine samples of butter and cheese were among the products exhibited.

The neat stock was very much commended. Among the animals presented for inspection but not for premium, was a large ox, owned by Colonel Story and Mr. Stinson, of Dunbarton, of the same breed with the great Greenland ox lately exhibited at the south, and now in Boston for exhibition. This ox, or stag, is now five years old; a well built and good proportioned animal—his weight is not known, but his girth is more than eight feet, and his length nearly twelve.

The public exercises were, "a very appropriate prayer from the Rev. Mr. Arnold, an address by PHILIP CARRIGAIN, Esq. of Epsom." Of Colonel Carrigain's address, it is perhaps sufficient to say that it is characterized by the exuberance of fancy, flow of humor, and elegance of diction which have so long distinguished its accomplished author. But to do justice to it we should say more than this—we should say that it embraced, among other good things, a good portion of valuable information, and conveyed much useful, practical

instruction. The Society dined at Capt. Emory's hall. A few choice sentiments, together with a song written for the occasion by a member of the Society, and sung with spirit and effect, by Major John D. Abbott, closed the repast.

The ploughing match, which was well conducted, occupied a part of Thursday, and the reading and attending to the reports of the various Committees and an instructive dissertation from Dr. Ebenezer Larned, of Hopkinton, closed the interesting exercises.—*Abridged from N. H. Statesman.*

The following Gentlemen were elected Officers of the Merrimack Agricultural Society for the year ensuing.

William A. Kent, of Concord, President.
Joshua Darling, Henniker, Vice-President.
Thomas D. Merrill, Epsom, Treasurer.
John West, Concord, Secretary.
Richard H. Ayer, of Hooksett—Caleb Merrill, of Pittsfield—Joshua Fifield, of Salisbury—James Cochran, of Northfield—Levi Bartlett, of Warner—Isaac Gerrish of Boscawen—*Directors.*

The following is the list of Premiums awarded: Enoch Gerrish, Boscawen, for the best farm, \$12.

Wm. Little, Hopkinton, the next best do. 10
Benj. Wheeler, Concord, the next best do. 8
Laban Morrill, Canterbury, the next best do. 6
Amos Cogswell, Canterbury, the next best, 4
Page Eaton, Henniker, the best Kitchen Garden, 3

John Proctor, Henniker, for his Crops, 4
Sam'l A. Kimball, Concord, for the best field corn 3

Sam'l French, London, the best pair Working Oxen, 4

John Kimball, Canterbury, the next best do 1 vol. N. E. Farmer,

Olney Thompson, Pittsfield, the best pair 3 year old Steers, 3

John Curry, Northfield, the next best do. 1 vol. N. E. Farmer.

Simon Green, Pittsfield, the best bull, 4
Warren Story, Dunbarton, the next best do 3

Charles Glidden, Northfield, the next best do. N. E. Farmer,

Laban Morrill, Canterbury, the best two year old Steers, 2

Enos Hoyt, Northfield, the best bull Calv, 1 vol. N. E. Farmer.

Robt. Ambrose, Concord, the best Milch Cow, 4
David Morrill, Canterbury, the next best do, 3

Enos Hoyt, Northfield, the next best do 1 vol. N. E. Farmer.

David Morrill, Canterbury, the best three year old Heifer, 2

David Morrill, Canterbury, the next best do 1 vol. N. E. Farmer.

Josiana Lane, Chichester, the best two years old Heifer, 2

Daniel K. Foster, do. the next best do, 1
Richard Greenough, Canterbury, the 4 best yearlings, 1 vol. N. E. Farmer.

Charles Moody, London, the best Stud Horse 5
Stephen Cate, London, the best Mare and Colt, 4

Stephen Perkins, Chichester, the next best do 1 vol. N. E. Farmer.

Richard Greenough, Canterbury, the best Saxon or Merino Buck, 4

Richard Greenough, Canterbury, the 5 best Saxon or Merino Ewes, 3

Joseph Baker, London, the best Boar, 3
Isaac Virgin, Concord, the best sow, 1 vol. N. E. Farmer.

Jeremiah Emery, Concord, the two best Spring Pigs, 2

Joab Patterson, Hopkinton, the best piece Filled Cloth, 3

Amos Putney, Warner, the next best do 1 vol. N. E. Farmer.

Joab Patterson, Hopkinton, the next best do, 1
Joshua Darling, Henniker, the best piece Cassimere, 3

William L. Woods, do. the next best do 1 Vol. N. E. Farmer.

Joab Patterson, Hopkinton, the best specimen dressed Filled Cloth, 1 Vol. N. E. Farmer.

Joab Patterson, do the next best do. 1
Mrs. Richard Bradley, Concord, the best piece Carpeting, 3

Miss Mehitable Tucker, Hopkinton, the next best do. 2

Charles Stinson, Dunbarton, the best Cotton & Woolen Coverlet, 1

Abigail Davis, Canterbury, the next best do.—50 ets.

Miss Comfort Moore, London, the best Counterpane, 3

Benjamin F. Neil, London, the next best do. 50 ets.

Joab Patterson, Hopkinton, the best piece of Flannel, 3

Benjamin F. Neil, London, the best pair of blankets, 1

Mrs. Abigail Davis, Canterbury, the next best pair of blankets, 1

Asenath Mason, London, the next best do. 1

Mrs. Nancy Dudley, Pembroke, the best Grass or Straw bonnet, 2

Miss Mary B. Martin, London, the next best do. 1

Susan Chadwick, Boscawen, the best woolen hose, 2 pair, 1

Mrs. Page Eaton, Henniker, the next best do. 50 ets.

Charles Stinson, Dunbarton, the best piece linen cloth, 2

John Townsend, Salisbury, the next best do. 1

Charles Stinson, Dunbarton, the best piece table linen, 2

Mehitable Foster, Canterbury, the next best do. 1

Charles Glidden, Northfield, the best specimen of Cheese, 1 Vol. N. E. Farmer

Enoch Gerrish, Boscawen, the next best do. 1

Charles Glidden, Northfield, the best specimen of butter, 1 Vol. N. E. Farmer.

Cyrus Tucker, London, the next best do. 1

Ruel Walker, London, the best manufactured leather, 1 Vol. N. E. Farmer.

Same, the best calf skins, 1

Isaac Eastman, Concord, the best breaking up plough, 1 Vol. N. E. Farmer.

Same, the best seed plough, 1

Same, the best ox yoke, 1

Same, improvement in plough, 2

Same, the best specimen of Blacksmith work, 1 Vol. N. E. Farmer.

Same, the next best do. 1
Dr. Ebenezer Larned, Hopkinton, the dissertation on making compost manure, 1 Vol. N. E. Farmer.

Benj. F. Neil, London, the best hearth rug, 1.
Miss Clarissa Brown, Epsom, Lace Veil, 1

Miss Sarah Jane Stevens, Pembroke, Lace, 50 cts.

Mrs. Catharine H. Stevens, do. Lace Handkerchief, 50 cts.

Cena Tucker, London, Lace Veil, 50 cts.

Benj. F. Neil, do. Cape Lace, 50 cts.

Miss Mary E. Little, Hopkinton, Lace Handkerchief, 50 cts.

Same, Lace Collar, 50 cts.

Miss Sally M. Cady, Concord, Lace Cap, 50 cts.

John L. Hall, Northfield the best ploughing, 4

Charles Glidden, do. next best do. 3

Shadrach Cate, Loudon, next best do. 1

Scalds and Burns.—A Doctor Ward, of Manchester, corroborated by Mr Tatham, surgeon, of Kendal, has published cases in the *Lancet* of severe burns and scalds effectually cured by dredging the parts affected with fine wheaten flour.—This process is to be repeated as often as apparently requisite, and the flour allowed to remain on the patient, in the form of paste, till it gradually falls off as the skin has been restored. The relief from pain is, in every instance, described as immediate. It is recommended generally to cover the flour with cloths, to exclude the air; and, lest ignorant people should slight so simple a remedy, Mr Tatham advises that the profession should send this specific to the afflicted “in a formal manner.”

Extraordinary crop of Onions.—The extraordinary quantity of 141 bushels of Onions was gathered off 190 square yards of ground in the garden of Newburg this present autumn, being at the rate of 1000 bushels per acre. Taking each bushel to weigh four stones and an half, it will give nearly one stone to each square yard, and rate at the enormous quantity of twenty-nine tons and an half per acre.—*York Herald (Eng.)*

Cheap and valuable Manure.—Raise a platform of earth, eight feet wide, one foot high, and of any length according to the quantity wanted on the head-land of a field; on the first stratum of earth spread a thin stratum of lime fresh from the kiln, dissolve or slake this with salt brine or sea-water from the nose of a watering-pot, add immediately another layer of earth, then lime and brine as before, carrying it to any convenient height. In a week it should be turned over, carefully broken and mixed, so that the mass may be thoroughly incorporated. This compost has been used in Ireland, has doubled the crops of potatoes and oats, &c. &c. and is said to be far superior to stable dung.—*Bucks Gaz.*

New Zealand Spinach (*Tetragonia expansa*).—This most delightful vegetable which has only within a few years been introduced among us, forms an important addition to our culinary herbs, and is remarkable for the luxuriance with which it grows in our climate. In the garden of Mr Wilson at Rose Hill, a single plant, the produce of one seed, covered, this summer, an area of 4 feet in extent, and abounded with large, tender, succulent leaves, affording one of the most delicate greens for the table of any of the spinaceous plants. It has the further advantage over other spinage of maintaining its succulence and verdure the whole summer; and crops may be frequently taken during the season from the same root. No kitchen garden ought to be without a supply of it;

and as it readily produces seed, a few plants would be sufficient to stock a whole neighbourhood.—*M. F. Farmer.*

BETULA, the Birch tree.

The trees of this genus most commonly known, are the birch and the alder. All the betula love a moist soil. The birch is applied to an infinity of uses. A wine is drawn (by tapping) from the trunk, by the natives of Canada; and in Europe wine is made from the fruit of the alder. The birch, though the worst of timber, is manufactured into vessels of various domestic uses. It makes capital charcoal. The inner silken bark, which peels off annually, was formerly used for writing on, before the invention of paper. In the northern climates the coarse bark is used instead of tiles or slates for the covering of houses. It is also used in certain processes of dyeing, and for tanning leather. In Kamtschatka they form the bark into hats and drinking cups. One great advantage in the birch, is, that it will grow where scarcely any thing else will thrive, and thus, almost barren land may be made to bring in a certain income of at least 20s. per acre. Broom makers are constant customers for the twigs, and hoop benders for the larger branches, and for the trunks, the turners and manufacturers of instruments of husbandry have a constant demand.

Extracts from Prince on Horticulture.

Ilex Opaca, or Common American Holly.—This is the most hardy of the native species, and is found growing in abundance on the sandy beaches of Long-Island, on the borders of the ocean, and exposed to every storm. Its growth is slow, and in some instances it is said to attain to the height of 60 feet, or more; but its general size is from 15 to 20 feet. During, however, the whole stage of its growth, it presents a fine appearance, the dark green foliage being finely contrasted by its bright red berries.

Symphoria glomerata, or Indian Currant.—This forms a shrub of about five feet in height; the branches are numerous; the leaves are small, oval, and very profuse; the flowers are small and make no show, but are followed by red fruit at every joint and leaf, about the size of currants, which give it an interesting appearance, and remain on until late in winter. All three of the foregoing are of easy culture; they will thrive in almost any soil, and throw up numerous shoots.

Clematis vitalba, or Traveller's Joy. This, altho' a native of Europe, greatly resembles the Virginian Virgin's bower. Its growth, however, is far more strong and vigorous—its branches are very numerous, and will quickly overtop hedges, or any thing they can climb by. The leaves are pinnated, of a blueish green, and moderately large; the flowers are white, and are produced in clusters all over the plant in July and August. These are succeeded by seeds, each with a hairy plume, which remain on during winter, and it is from the appearance of these covering the tops of hedges, &c. in winter, and giving them an appearance calculated to amuse the traveller, that it has received the appellation of Traveller's Joy.

Pinus microcarpa, or Common American Spruce. This is called by many Hackmatack, and grows naturally in low wet situations, where it forms a tree often of 40 feet in height; it will succeed in an upland soil, and its pale green foliage, taken in

connection with their peculiar arrangement, render it very beautiful and interesting. The appearance also of the small cones when young is worthy of notice, and adds much to its ornament at that period. In this particular there are three varieties, viz. those producing white cones, brown cones, and red cones. These variations, which are so striking during the growth of the cones, are not equally discernable at their maturity, as they then become dry and lose their color.

Striped Maple, or *Acer striatum*.—This is a tree of fine foliage, and medium stature; the bark of the young branches is most singularly striped with white.

Spiraea.—This genus comprises many shrubs of delicate and beautiful appearance, which are mostly natives of Siberia and North America, viz.

***Spiraea hypericifolia*, or *Hypericum Leaved*.**—The leaves of this are very small, and the flowers are exceedingly delicate and beautiful: these are white, and produced in the greatest profusion along the branches, forming in many instances long wreaths. It attains to the height of about five feet.

***Spiraea salicifolia*, or *Willow Leaved*.**—The flowers of this are also white, and are produced in panicles, more or less diffuse, and are much admired. This forms rather a taller shrub than the preceding, and its leaves are also of larger size.

***Sorbus americana*, or *American Mountain Ash*.**—This somewhat resembles the Scotch Roan tree, (which has long been considered as one of the greatest ornaments of Highland scenery,) but its leaves are much larger, and of a paler green; the berries which compose its clusters are also smaller, added to which, it loses its foliage much sooner, as autumn advances. The tree is also of less stature than the Scotch Roan, and in gardens, seldom rising above twelve or fourteen feet, and forming a far less regular top than the foregoing. Its large clusters of bright red fruit are nevertheless beautiful, and although it is not equal to the European, it possesses claims to our attention.

Kalmia latifolia grows to the height of seven or eight feet, and sometimes higher. The wood is hard, compact, and is employed by turners and joiners, in making work requiring such wood. It also furnishes handles for scythes.

Purifying water.—It is not so generally known as it ought to be, that powdered alum possesses the property of purifying water. A large tablespoonful of pulverized alum, sprinkled into a hog-head of water, (the water stirred briskly round at the time) will, after the lapse of a few hours, by precipitating to the bottom the impure particles, so purify it, that it will be found to possess nearly all the freshness and clearness of fine spring water. Four gallons may be purified by a single tea-spoonful.

Distressing accident.—A child of about four years of age belonging to Mr. Rosebury, of Greenwich, was a few days since, burned to death at the house of its father in law. We understand that the child was left alone in the house, and getting near the fire, its clothes caught, and before assistance came it was so dreadfully burnt that it expired the same night. Let parents and guardians beware!

FOR THE NEW ENGLAND FARMER.

CONTRIBUTIONS TO ENTOMOLOGY.

BY THADDEUS WILLIAM HARRIS, M. D.

No. IV.

Subgenus Anchomenus.

United to *Callistus* by Latreille, who informs us that it is distinguished from *Agonum* by having the thorax heart-shaped and truncated at base and apex. Leach says that the characteristics of this genus of Bonelli are, to have the third and fourth joints of the palpi equal, sub-acute; the basal thoracic angles acute; and (in which it differs from *Callistus*) in having the thorax glabrous, the labrum transversely quadrate, entire, and the body somewhat depressed.

Our species exhibits the above characters, on which I must depend for the propriety of arranging it in the genus, no foreign types of which I have seen. Congeneric is *FERONIA decora*, Say, and probably also the species named by him, *F. rincticollis* and *decentis*. The *decora* is about the size of the following, has a rufous thorax and dark cupreous elytra. They are found under stones in wet meadows.

A. extensicollis. Head and thorax green, elytra purple, margined with green; beneath piceous; feet ochreous.

Length seven twentieths of an inch.

Head impunctured, and, with the thorax, argumous green; lip and mandibles piceous, palpi and antennae dark redish brown, basal joint of the latter ochreous. Thorax at base and dilated lateral indentations slightly punctured, dorsal furrow distinct. Scutell blackish purple. Elytra deep redish purple, external submargin green, with twelve or more ocellated punctures; striae distinctly punctured at base interstitial lines very slightly convex, with exceedingly minute punctures, the third line with from five to seven large punctures, three of which nearest the base are contiguous to the third stria, the fourth in the middle of the interstitial line, and the remaining ones contiguous to the second stria. Body beneath glabrous, piceous; feet ochreous.

The punctures of the interstitial lines are so small as not to be discovered except by a powerful magnifier. It is probable that this insect is the *FERONIA extensicollis* of Say, with whose description it agrees in most respects, and therefore his name is adopted, until a comparison with an undoubted specimen of his insect shows mine to be distinct, in which case it may receive the specific appellation of *proximus*. Mr. Say describes the *extensicollis* as having impunctured striae, convex interstitial lines, rufous antennae and palpi, and testaceous feet, in which it differs from our species.

GENUS CHILINUS.

c. pubescens. Head and thorax green, elytra olivaceous, head impunctured, labrum truncate, body beneath fuscous feet pale ochreous.

Length nearly nine twentieths of an inch.

Body pubescent, the hairs decumbent, sericeous, ferruginous. Head bald, glabrous, impunctured. Palpi and three basal joints of the antennae ochreous yellow, smooth; remaining joints fuscous, very hairy. Labrum and mandibles castaneous. Thorax above green, polished, punctured, with longer, more elevated hairs than on the elytra; broadest in the middle; longitudinal and transverse diameters subequal; lateral edges purple, regularly curved, slightly excavated at base;

disc distinctly canaliculate, basal lines tinged with purple, elongated, and curving outwards towards the middle of the margin. Coleoptra olivaceous, disc purplish, submargin green, outer edge dark ferruginous; surface slightly polished, deeply and distinctly punctured; punctures of the striae approximated, less distinct at tip; interstitial lines a little convex. Pectus, postpectus and vent fuscopiceous, punctured, with remote hairs. Feet pale ochreous yellow.

Apparently approaches very near to *c. Pennsylvanicus*, Melsheimer; but differs from Mr. Say's description of that species in being pubescent, in the paler color of the base of the antennae and feet, and in the differently colored elytra, and truncate labrum, the punctures of the striae, altho' less distinct, are by no means obsolete at tip. Found under stones in wet places.

GENUS DICELUS.

D. Leonardii. Redish black, polished; body, beneath, feet, and palpi piceous; antennae fawn-colored.

Length half an inch.

Body glabrous, polished, impunctured, above deep piceous or redish black, beneath paler. Mandibles and labrum black, palpi piceous at base paler at tip. Three basal joints of the antennae piceous glabrous, remaining ones covered with fawn-colored pubescence. Thorax quadrate, diameters equal, not contracted before; anterior angles simply rounded; somewhat contracted behind the middle, and rectangular at base, where it nearly equals the coleoptra in breadth; lateral edge not reflected; dorsal and lateral lines deep; anterior part of the disc with a small foveolus, each side of the dorsal line, and having a fortuitous appearance. Elytral striae impunctured; interstitial lines very convex, submarginal one serrate-punctate within. Feet piceous, tarsi paler above, and almost fawn-colored beneath.

The filiform antennae will prevent this insect from being mistaken for *ABAX coracinus*, Say, to which it appears to have some resemblance. The latter insect is known to me only by description.

This fine *DICELUS* was sent to me from Dublin, N. H. by the Rev. L. W. Leonard, whose kindness I am happy to acknowledge by the name. Two other species of the genus are found in this vicinity, namely, *D. dilatatus*, Say, and *D. elongatus*, Bonelli. They are found under stones, but are rare.

[From the New York Statesman.]

ON BLACK DYEING AS APPLIED TO WOOLEN CLOTH AND HATS.

The dyeing of black has deteriorated so much within the last forty years in England, and in this country as the copyist of England, that the colors would be considered as unwearable, were not the cloths as evanescent in their fabric as the colors are fugitive. The faint miserable colors given to the blacks in the present day has been mainly the result of the prevailing passion for cheap goods.—To meet and indulge that ridiculous unprofitable passion, the manufacturer has been compelled gradually to make his goods in the most flimsy manner, and the dyer to make his color at as low a rate as possible. So much has the dyeing of black been lowered in the west of England, that a piece of twenty yards of broad cloth which forty years since was charged thirty shillings, is now done for six shillings and eight pence, and the dyer makes nearly the same profit now as he did then.

Before the year 1790, all the black cloths dyed in England, excepting the coarser grades, were colored blue in the woad vat previous to their receiving the black dye; and a considerable portion of nutgalls was used with logwood, &c. in finishing the color. All the black cloths brought from England have a white and a blue rose near the end. The white rose was designed to show that the cloth was white previously to its being dyed blue; for, as cloths dyed other colors, if found defective, were usually dyed black to cover their imperfections, and as repeated colorings were found to injure the texture of the goods, the dealers would not give the same price for cloths without the white rose. The blue rose was designed to show that it had received the blue dye, and the color of the rose was considered a criterion of the depth of the blue given. The white and blue roses are still preserved; but the blue is never put on, excepting by dipping a corner of the cloth in the blue vat, and by tying a rose on that part.—Nutgalls, which were found to give permanency to the colors, have also been exploded as too expensive; and the blacks now given to the public, are dyed with only logwood, fustic, and sumach. The latter being the only material in the composition that has any tendency to impart the least degree of permanency to the color, and that is necessarily used in such small portions, to preserve the blue bloom of the now fashionable colors, as to have but little effect in checking the fugitive dye of the logwood.

The French and the Germans have always made much better black, and given to that color a far greater degree of permanency than the English. I am aware that this opinion will be considered as high treason by English agents, through whose influence the most flimsy goods, and the most miserable colors, have become fashionable in this country, and the public taste in this particular, been materially vitiated. To prove the correctness of this opinion, I need only request any citizens, who have an opportunity of doing it, to compare an English black that has been worn three months with a French black that has been worn the same time.

The color put on hats is even more fugitive than that put on the cloth; and it is high time that our dyers, both of woolen and hats, should pursue some mode of giving more permanency to their colors. The primary object of this essay is, to show them how this can be effected, without any additional expense to the operator. I am aware that it would be worse than useless to attempt to bring our dyers back to the old expensive but highly permanent process of giving a woad-blue to their goods before coloring them black: for the public taste has become so highly vitiated by the passion for cheap goods, that firmness of fabric, body, and permanency of color, and every other quality that give to them an intrinsic value, are now never taken into consideration. As giving a blue ground is out of the question, and as the nutgalls, the next most permanent mode, must also be resigned as too expensive, I have to direct the attention of our dyers to a material growing abundantly in this country, which answers even a better purpose than nutgalls, and will cost no more than the process now pursued.

Most persons living in the interior of the country know that the bark of the swamp maple will make good black ink, though they may not be aware that four pounds of this bark, dried and

round, are equal to one pound of the best galls. The black obtained from this bark is equally as permanent as that from galls, and as the bark gives a much smaller portion of extraneous precipitate, it will clean better, and make a much brighter color. Those dyers who formerly used nutgalls will know what quantity of swamp maple to use to a given quantity of logwood; but I should suggest to more modern dyers to leave out one pound of logwood for every pound of bark used by them.

Some few of our woolen dyers have, at my suggestion, used the maple bark for three or four years, and their colors are much esteemed both by dealers and consumers. Should the colors prove too blue they may be altered to any hue by the use of sumach or alder bark. W. P.

A VALUABLE DAIRY.

We are informed that Mr Israel Cole, of this town, (North Adams) has made this season 16,000 pounds of Cheese from the milk of only 28 cows; being on an average, 571 pounds to each cow.—We understand he increases the quantity of milk by giving his cows daily the whey mixed with meal. His cheese is of the best quality, and fetches, with his established customers in New York, one or two cents per pound more than that of ordinary dairies. Such a dairy, when cheese was at the price of 12½ cents per pound, would make a man rich in a few years, and even at the present moderate prices, is no contemptible income.

PICKLE FOR BEEF AND PORK.

The following recipe for making pickle for beef or pork is strongly recommended for the adoption of those who pickle beef and pork for family use. Persons in the trade who will adopt it, will find a ready sale for their beef and pork. It has been used by many families in this city, and always approved. I do not hesitate to say that there is no pickle in use to be compared with it. It is familiarly known by the name of the *Kuickerbocker Pickle*. Could this recipe be generally adopted, our pickled beef and pork would have certain preference in foreign markets.

RECIPE.—Six gallons water, 9 lbs. salt, coarse and fine mixed, 3 lbs. brown sugar, 3 ounces salt petre, 1 ounce pearl ash, 1 gallon molasses to every 6 gallons of water.

In making a larger or smaller quantity of pickle, the above proportions are to be observed. Boil and skim these ingredients well, and when cold put it over the beef and pork.—*N. Y. paper.*

A LAUDABLE COMBINATION.

We have been favored with a copy of a small pamphlet, entitled, "*Regulations of the Salem Association for the Detection and Prosecution of Trespassers on Gardens, Fields, and Orchards, in the town of Salem and vicinity.*" The preamble to the resolutions is as follows:—

Whereas the offence of robbing fruit trees, trespassing upon inclosed grounds, and wantonly injuring trees, planted for shade and ornament, has become so prevalent in this neighborhood, as to form a serious obstacle to the cultivation of gardens; and whereas, the laws of the Commonwealth, if duly enforced are sufficient to prevent and punish such offences:

"**THEREFORE**, be it resolved, by the individuals present at this meeting, that we will form our-

selves into a Society for the protection of this kind of property; and to this end, we promise to each other mutual aid and facility towards detecting and bringing to punishment, all future offenders against the laws made for the protection of that species of property, belonging to the subscribers. In order more effectually to give efficacy to the objects of this association, we agree to adopt for our government, the following code of regulations."

"By this code the Society is denominated 'The Salem Association for the Detection and Prosecution of Trespassers on Gardens, Fields, and Orchards in the town of Salem and its vicinity.' The officers of the Society consist of a President, a Vice-president, Secretary and Treasurer, and a board of three Directors. It is made the duty of the board of directors to 'institute processes for all violations of the laws made in the premises, that shall come to their knowledge by information of members of the Society; they shall have power to give suitable rewards for the detection of trespassers, and to employ such agents as may be deemed by them proper for this purpose. They may at their discretion publish the names of all convicted offenders against the laws made for the protection of gardens and orchards, in some paper or papers, printed in the town of Salem.'"

The law on which the association is founded is as follows:

In Act in addition to an Act, entitled "An Act for the more effectually preventing of trespassers in diverse cases."

SEC. 1. *Be it enacted, by the Senate and House of Representatives, in General Court assembled and by the authority of the same,* That, from and after the passing of this act, if any person shall enter upon any grass land, orchard, or garden, without permission of the owner thereof, with intent to cut, destroy, take, or convey away, any grass, hay, fruit, or vegetables, with the intent to injure or defraud such owner; each person so offending, shall pay, for every such offence, a sum not less than two dollars, nor more than ten dollars, to the use of the Commonwealth, to be recovered on complaint before any justice of the peace of the county in which the offence shall be committed; and the person so offending shall also be liable in damages to the party injured.

SEC. 2. *Be it further enacted,* That, from and after the passing of this act, if any person, having entered upon any grass land, orchard, or garden, shall take therefrom, without permission of the owner thereof, and with the intent to injure or defraud such owner, any grass, hay, fruit, vegetable, or shrub, cultivated thereon for ornament or use; such person so offending, shall forfeit and pay for each offence, to the use of the Commonwealth, a sum not less than five, nor more than fifty dollars, to be recovered by indictment, or information before the Circuit Court of Common Pleas, in the county where such offence shall be committed; or the Municipal Court of the town of Boston, if such offence be committed in the county of Suffolk; and the person so offending shall be also liable to the party injured, in a sum equal to three times the value of such grass, hay, fruit, vegetable or shrub, to be recovered by action of the case in any court of competent jurisdiction.

SEC. 3. *Be it further enacted,* That, any person who, having entered upon any grass land, field or orchard, shall, without permission of the owner

thereof, and with the intent to injure him, break, bruise, cut, mutilate, injure or destroy, any fruit tree, tree for ornament or shade, or shrub, cultivated thereon for ornament or use, and which shall be standing or growing thereon, such person so offending, shall forfeit and pay to the use of the Commonwealth, a sum not less than ten dollars, nor more than one hundred dollars, to be recovered by indictment or information, in manner as is provided in the second section of this act.

SEC. 4. *Be it further enacted,* That if any person shall commit any of the trespasses mentioned in this act, on the Lord's day, or the night time, that is to say, between the sun-setting and sun-rising, he shall be liable to double the penalties and forfeitures, the same to be prosecuted for and recovered, in manner as before provided; and all prosecutions for breaches of this act, shall be commenced within one year from the time the offences shall be committed, or the penalties and forfeitures shall have accrued, and not afterwards.

[Approved by the Governor, June 12, 1828.]

[Prepared by the Editor.]

BEES.

FROM THE NORTH AMERICAN REVIEW
(Continued from page 115.)

It is better to begin with a single hive, and so attain a knowledge of the habits and instincts of bees by degrees. We have known several persons, who have purchased a number of hives at once, and relinquished the pursuit from the perplexity that ensued when the swarming season commenced. But there is no similar occupation so easily followed, and none that requires so little capital, as that of keeping bees. The profit is enormous. If a person, well trained to the employment, should follow the plan adopted in some parts of Europe, of removing the bees from place to place, in a kind of ark on a river of some length, thus providing a plentiful supply of food, he might increase his stock to any extent.

An apiary of twenty hives could maintain itself in an area of a mile, where there is plenty of blossoms. Every farmer should, however, provide pasture for his bees, as well as for his cows; and therefore when the spring and summer flowers are gone he should have a field of buck wheat ready, which, although not so palatable as other flowers, will serve the bees for winter food.

An apiary, or bee-shed, should be at the caves, about four feet from the ground, with a roof sloping both ways, and with any aspect that the owner chooses. It should be ten feet wide, and the length of it should be increased as the hives multiply. It is, however, difficult to describe one accurately.

The most convenient one that we have seen is on a farm near New Brunswick in New Jersey. It is fifty feet long, and contains sixteen hives on each side. The swarms which are successively cast off, are placed under the same shed in the winter, and an equal number of the old hives are sold to make room for them. This apiary might be enlarged to any extent, were there pasture enough for the bees; but the area of the bees' flight, as there are now many cultivators of bees in this district does not furnish food enough for a great number.

In this apiary the miller or night moth is successfully guarded against. A small wire door, made to slide behind two door posts, formed of

needles is closed over the entrance of the hive, as soon as the bees have retired for the night. This is done during the months of April, May and June; after that if the weather sets in warm, and the bees are oppressed by heat, the floor of the hive is let down, which, as it is fastened to the hive by hinges, and on the side with hooks and staples can easily be accomplished. Two rows of scantlings or joists four inches square, and running the whole length of the apiary, receive the hives between them, which are thus suspended at a distance of about three feet from the ground.

The hive is thirteen inches square at the top, and is of the same size at the bottom of the front and back, but the bottom of the sides is only seven inches wide. By this slope of the hive the combs wedge themselves as they are made, and there is no use for the ill-contrived crossed sticks, that are generally thrust in the old hives, to keep the combs from falling down by their own weight. The floor is, as we observed, fastened by hinges and hooks. It is likewise an inclined plain, having a slope of at least four inches.

The advantage of this inclination will be instantly seen. The perspiration of the bees, which is copious, is, by the inclination of the sides and floor, conveyed off at once, without being absorbed by the boards. All extraneous matter can be carried away by the bees with very little trouble, and they can defend themselves from robbers or corsair bees with much greater ease than if the floor were flat.

As the floor opens and shuts, the observer can inspect the interior of the hive at pleasure, not with the hope of getting at the minutiae of the bees' policy, but to see the forwardness of the combs, the number of the bees, and the general appearance, which a practised eye will soon understand. When the floor of the hive is left down all night, and the bees hang very low from the combs in the morning, they will soon remove themselves up again, if the floor is raised very gently and slowly and fastened as usual.

The cover of the hive is of course thirteen inches square. It is made of common pine, as is the hive, with two cletes on the upper part, as well to prevent the board from warping, as to prevent the box, or upper story, which is always added, from being moved from its place. The cover of the hive has three holes of an inch diameter, within a quarter of an inch of the other. These holes are to allow the bees to pass to the upper box, when the hive is full of honey.

It is ascertained satisfactorily, that the young brood and the bee-bread or pollen are deposited in the hive where the swarm is first put. The holes in the cover are therefore kept shut by plugs, until the hive be filled. The holes are then opened, the bees immediately pass up, and if the season be propitious, they fill the upper box with comb and honey, which, as there is neither brood nor bee-bread is of the finest and purest kind.

We have often seen forty and fifty pounds obtained by this simple proceeding; and the box is also used to feed a furnished hive in the spring. A single comb, left in one of these boxes will sustain a swarm, that has eaten up all its honey, till vegetation commences. As the boxes and hives are of equal size, any box will fit a hive.

When the combs in the hive are three years old, two of them can be taken out every winter, provided there remain honey enough in the rest for the use of the bees. Thirty weight of honey

is the average quantity that suffices for a swarm of large size. The hives in question weigh, when empty about twelve pounds, a swarm of bees four pounds, the wax two pounds. The whole, therefore, ought to weigh about fifty pounds in November. All over this quantity can be taken out to advantage, as the wax becomes very dark after two or three years. The whole of the combs can be thus renewed in the course of four years, as the bees replace them early in the spring. We omitted to mention that the length of the back of the hive is twenty-two inches, and the floor projects in front about three inches, thus forming an apron or platform, on which the bees alight before they enter in at the little door. Models of this hive have been sent to several of the horticultural societies of Europe, and they are getting into use in this county.

When a swarm is to be hived, the hive is put in a moveable frame which is easily carried to the tree where the swarm hangs, and this is proved to be the easiest method of hiving swarms; as the screws are taken out of the cover and the hive lifted up to the swarm in which they are shaken. The frame and hive are then placed on the ground, and the cover is gently laid on or screwed fast to the hive. Little sticks are put against the apron and rest on the ground, serving for ladders for those bees that fell to the ground when the main body was shaken into the hive. Bees from the moment of their leaving the hive (when swarming) until they are fairly settled and at work in a new habitation, seem stupid and confused. This arises, however, from the precarious situation of their queen. If she fall into the hive when the swarm is shaken in, all the remaining bees will soon find their way to the entrance; for a peculiar sound is emitted by these insects when their queen is present. If, however, she remain on the limb, it will be necessary to shake it again over the hive, as the bees will leave it to fly up to the place where the queen is. When the bees are quiet in the hive (which is ascertained by the number that are seen hovering in the front of the entrance on the wing, and by others ventilating the hive with their wings), the top can be covered with a sheet, doubled several times, to keep off the heat of the sun. The hive must remain in the same spot until eight or nine o'clock in the evening, when two persons can quietly convey it, frame and all, to the apiary, and place the hive, with great care between the joists where it is permanently to remain.

Hives should be made and painted a year before they are used, as the smell of paint is disagreeable to the bees. The smoother the boxes and hives are, inside and out side, the better both for the health of the bees and for preventing the deposit of the eggs of the miller. We must except the roofs of the hive and of the box, as they should be rough; for we have ascertained, that the propolis, or bee-glue does not adhere so closely to a smooth surface at all times.

And here we would remark, that it has been the custom, from the earliest ages, to rub the inside of the hive with a handful of salt and clover, or some other grass or sweet scented herb, previously to the swarm's being put in the hive. We have seen no advantage in this; on the contrary, it gives a great deal of unnecessary labor to the bees, as they will be compelled to remove every particle of foreign matter from the hive before they begin to work. A clean cool hive, free from

any peculiar smell or mustiness will be acceptable to the bees; and the more closely the hive is joined together, the less labor will the insects have, whose first care it is to stop every crevice, that light and air may be excluded. We must not omit to reprehend as utterly useless, the vile practice of making an astounding noise, with tin pans and kettles, when the bees are swarming. It may have originated in some ancient superstition, or it may have been the signal to call aid from the fields to assist in the hiving. If harmless, it is unnecessary; and every thing that tends to encumber the management of bees should be avoided. (To be continued.)

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOV. 14, 1828.

Samuel Breck, Esq. of Philadelphia, has delivered an address in honor of Judge Peters, before the Agricultural Society of which Judge Peters was formerly president.

An establishment is in operation in Kentucky for water rotting and breaking hemp. The vat is one hundred by seventy feet, and rots a ton and a half of hemp in about seven days. The machine breaks 1200 a day.

AMERICAN LYCEUM.

A respectable meeting was held at the Exchange Coffee-house on the evening of the 7th inst. to take into consideration the subject of the American Lyceum. The meeting was organized, by choosing the Hon. Mr. Webster to the chair, and Mr. G. B. Emerson secretary. In answer to the call of Mr. Russell, editor of the Journal of Education, Mr. Holbrook gave an account of the establishment of branches of the Lyceum in several places, in this and some of the neighboring States; of the mode in which they had been conducted, and of the good effects, which had already been produced by them.

The Hon. Mr. EVERETT expressed the interest which he felt in the success of the institution. He stated some facts in relation to the good which was promised, and which had been effected by similar institutions in this country and elsewhere; and remarked particularly upon the facilities which would be afforded by the associations of the nature of the Lyceum, in procuring books and instruments, which individuals would not be able to procure for themselves. The chairman made a few observations on the benefits resulting from these associations. Several resolutions highly approving of their objects, were passed, and a committee, consisting of Messrs. Russell, Holbrook and Emerson, was appointed to report to the meeting at the adjournment, in what way the most effectual aid could be afforded to the interests of the Lyceum. The meeting adjourned, to meet again this evening at 7 o'clock, at the Exchange Coffee-house; at which time the committee will report.

Good farming.—It is stated in the American Traveller, that J. L. Boylston, Esq., of Princeton, in this State, has raised this year, from three and a half acres and twenty-eight rods of ground, two hundred and twenty-six bushels of corn; averaging sixty-one and a half bushels of shelled corn per acre. And also on the same land, fifty cart loads of pumpkins, and a hundred and twenty bushels of turnips.

Canal Revenue.—It is stated in the Albany Daily Advertiser, that the amount of toll paid this year up to the first day of Nov. to the collector at Albany, is one hundred and forty-two thousand eight hundred and twenty-three dollars.

ERRATA.—In the third number of Dr Harris's article on Entomology, page 122, column 3, for *Omascus* read *Omascus*. Page 123, column 1, line 43, after *downy* insert a comma. Column 2, line 6, for *universally* read *usually*. Line 8, for **picous* read **piceus*. Line 20, for *lip* read *tip*.

To Correspondents.—Several valuable communications are on hand, which will soon appear.—Among others one from a correspondent in this city on CIDER—one from Connecticut on FOREST TREES—and one from Pennsylvania on a NEW INSECT IN FRUIT TREES.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts. a paper. They were gathered by a gentleman familiarly acquainted with the soils, expressly for us. They will be sold by the single paper, or packed to order, in any quantity. A description of several of the trees will be found on page 131 of this week's New England Farmer. Among the assortment is the following

Acer saccharinum	Sugar Maple
Ilex opaca	American Holly
Convallaria	Solomon's Seal
Symphora glomerata	Indian Currant
Cornus sericea	Red Osier
Tilia glabra	Bass Wood
Aralia nudicaulis	Wild Sarsaparilla
Betula excelsa	Yellow Birch
Acer spicatum	Mountain Maple
Kalmia latifolia	Laurel
Kalmia angustifolia	Sheep Laurel
Alnus	Alder
Clematis vitalba	Traveller's Joy
Sorbus americana	Mountain Ash
Taxus americana	American Yew
Spiraea salicifolia	Meadow Sweet
Viburnum americanum	White Ash
Acer striatum	Striped Maple
Penax quinquefolium	Ginseng
Azalea nudiflora	Early Honeysuckle
Pinus macrocarpa	American Larch
Aralia racemosa	Spikenard
Lilium superbum	Superb Lily
Arum triphyllum	Wake Robin
Pinus nigra	Black Fir

Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for us—For sale by the lb. or ounce.

Oat Meal, &c.

Fine Oat meal and Oat Flour, Hulled Oats, Hulled Barley, Barley Flour, &c. for sale by the barrel or less quantity, direct from Stevens' Mills, Vermont.

Orchard Grass Seed.

A few more bushels of this valuable Grass Seed, growth of 1833. Also, Lucerne, White Clover, Fowl Meadow, and every other kind of Grass cultivated in New England.

Shallots for fall planting, Tree and Potato Onions.

Just received at the

New England Farmer Seed Store,

No. 52 North Market Street, Boston.

Great sale of Wool.

ON THURSDAY, DECEMBER 18, AT 10 O'CLOCK,

At the Hall over the New Market

219 bales Saxony WOOL, consisting of first and second Electoral—first and second Prima, Secunda, and Tertia.

246 bags Leonessa Soriana Segoviana Spanish Wool.

120 bags Portuguese Wool.

429 bags (about 76,000 pounds) American Fleeced Wool, among which are some choice lots of selected Saxony and full blood Merino fleeces.

Catalogues will be ready for delivery and the Wool may be examined three days before the sale.

Coolidge, Poor & Head—Auctioneers.

Wine and Table Grappes.

A complete assortment of FRENCH VINE ROOTS in prime order, just received, and for sale at a low price, by E. Copeland Jr. at the Dupont Powder Store, 65 Broad Street. **AMMUNITION** as usual. 31.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

The collection of LILIES is very splendid, comprising Scarlet Chalcedonian Lily 50 cts., Orange Pomponne Lily 37 cts., Chinese Leopard 25 cts., Orange Martagon 37 cts., Yellow Martagon 37 cts., Double Violet Flamed 37 cts., Purple and White Spotted 37 cts., Bright Scarlet Pomponne 50 cts., Double White 37 cts., Large White Garden Lily 12 cts., Dwarf Chinese Red Lily (*Lilium concolor*, new and very superb, one root only) \$1.50.

HYACINTHUS—(double and single,) dark blue, porcelain blue, red and rosy coloured, pure white, white with yellow eye white with rosy eye, and yellow with various eyes; from 25 cts to \$1.00 each.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots, 33 cts. each.

JONQUILLES—sweet scented, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 33 cts. each.

DOUBLE NARCISSUS—fragrant, of all colours, 19 cts. each.

SPRING CROCUS—of all colours, 6 cts. each, 50 cts. per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave, such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 8-10ths in diameter.

Purchasers are requested to notice, that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the more refuse of the most inferior collections, good roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

Also pots for blooming the Crocus, in the shape of Hedgehogs, Porcelain Dice-work Flower Baskets, (very beautiful) Beehives, Flower Pots, Half melons, Cones, &c.—a new article.

A few more roots of Wilnot's Superb Strawberry.

Just received at the

New England Farmer Seed Store,

No. 52 North Market Street—Boston.

Subscription for Fine stock for the finest table Grapes.

A. Parmentier, at the Horticultural Garden, Brooklyn, corner of the Jamaica and Flatbush road, two miles from New York, having been urged by several lovers of the vine to propose sets of the best kind for sale by subscription, offers to the public sets of a dozen vines, with good roots of the most select and choice grapes for the table; many of which are quite new in this country, and all of which will ripen perfectly in any situation either in town or country.

Names of the twelve Sorts.

1. White Chasselas, with large fruit
2. Chasselas of Ponthieu, near Paris
3. Yellow Chasselas of Thomery, near Paris
4. Golden Chasselas, the real genuine
5. Musk Chasselas
6. Chasselas, with very large black fruit
7. Red Chasselas
8. White Muscat, or black Constantia
9. Red Muscat
10. Black Muscat, or black Constantia
11. Black Orleans, bears very well the frost
12. Black Gamet, yields a second crop of delicious and fruit when the first are frozen.

Nos. 11 and 12 are as fine for vineyards as for the table, the fruit is not so excellent as that of the preceding kinds, but is equally valuable on account of the certainty of a large crop annually.

The subscription receipt will be accompanied by directions on the best mode of cultivation, planting and pruning the vine.

The same sort of vines may be had separately, price One Dollar, except No. 4, Golden Chasselas, the genuine, which is Two Dollars. Communications for the above, and subscriptions to his establishment post paid punctually attended to.

References, Dr. David Hosack, President of the Horticultural Society, Dr. Pascalis, President of the Linnean Society, Dr. McNeven, Dr. Mitchell, Dr. Stevenson, and Hon. John Lowell, Nov. 11

Wanted,

On a farm in Roxbury a young man who has a knowledge of farming and can bring recommendations for industry &c. Apply at this office. 31. Nov. 7.

LINNEAN BOTANIC GARDEN AND NURSERY, near New York, *William Prince, Proprietor.*—The new Catalogues of this establishment are now in the press, and may soon be obtained from T. & J. Swords, New York, and of the other Agents. The collection of Fruit Trees has been nearly doubled since the last edition, and comprises all the choicest varieties of every country. The assortments of Ornamental Trees, Flowering Shrubs and Plants, Greenhouse Plants, &c. have also been greatly extended, and in fact every department has received the utmost attention both to its extension and improvement. The grounds occupied by the establishment have been extended to 40 acres, and the proprietor can now justly state that orders for every description of Trees and Plants will be executed in a manner superior to all former periods. The Cherries, Peaches and most other Trees are of large size—many of the Peaches, Apricots and Nectarines are on Plum stocks. The collection of Grapes consists of above 20,000 ready for sale, comprising all the choicest varieties, and will be shipped in quantities at reduced rates, and 100,000 more are expected shortly from France and Germany. Without intending invidious comparisons, the proprietor appeals to those acquainted with his establishment as to its decided superiority in every department. The whole management and supervision is attended by himself and sons, and orders received from any distance receive the same pointed attention as if the persons were on the spot to make their selections. The trees are packed in the best possible manner to ensure success, and with the greatest despatch, and are shipped to any place designated. And to those interested in Horticultural pursuits, he has only to say, that the same unremitted attention will be paid to the execution of its business, which has hitherto characterised the establishment. N. B. Plants of Wilnot's Superb Strawberry, and the celebrated Greville Rose can be supplied. nov 11—3

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the *Rheum Undulatum*, or Tart Rhubarb, or Pie-Plant, an excellent article for summer use. (See N. E. Farmer, vol. vi. page 290, and page 11 of this volume, and Fessenden's New American Gardener, article *Rhubarb*, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts. per root.

MISCELLANIES.

HARVEST HYMN.

The following effusion was written for a recent agricultural exhibition at Hartford, Connecticut.—We are so much accustomed to associate the name of Mrs. Sigourney with the poetry of our sister state, that we almost involuntarily attribute these lines to the fine fancy of that lady. To whomever they may belong, a certain warmth of feeling pervades them, which is one of the most apparent characteristics of Mrs. Sigourney's muse.

God of the year!—With songs of praise
And hearts of love, we come to bless
Thy bounteous hand, for thou hast shed
Thy manna o'er our wilderness;—
In early spring-time thou didst fling
O'er Earth its robe of blossoming—
And its sweet treasures, day by day,
Rose quickening in thy blessed ray.

And now they whiten hill and vale,
And hang from every vine and tree.
Whose penciled branches hanging low,
Seem bowed in thankfulness to thee,—
The earth with all its purple isles,
In answering to thy genial smiles,
And gales of perfume breathe along,
And lift to thee their voiceless song.

God of the Seasons!—Thou hast blest
The land with sunlight and with showers,
And plenty o'er its bosom smiles
To crown the sweet Autumnal hours:
Praise, praise to thee!—Our hearts expand
To view these blessings of thy hand,
And, on the incense-breath of Love,
Go off to their bright home above.

Cattle Fairs before the Revolution.—Before the Revolution, regular Cattle Fairs were held in the town of Hardwick, under the patronage of Timothy Ruggles, one of the most distinguished men in our country in former times. The political commotions which overspread the land swept away the custom so beneficial to the agricultural community.—We notice that the enterprising inhabitants of Southbridge, propose to revive the ancient usage, and hold on Saturday, the 8th day of November, a Fair, for the exhibition, sale, and exchange of cattle, horses and specimens of the mechanic arts.

The beneficial effects which have resulted from the encouragement given to industry by the Agricultural Societies, have been manifested in the annually increasing numbers of beautiful and valuable animals which crowd to their exhibitions, and in the spirit of improvement and of liberal competition which has gone through the community.—

The shows of these associations, while they present to observation and imitation the rarest specimens of the productions of the earth, of mechanical skill, and of good breeding, have not been occasions where the farmer could part with his surplus property, or supply his wants by sale or exchange. The best premium on the productions of skill and industry, is in the price they bring to the proprietor. Periodical sales have been attempted by the New England Society, and it is said with a degree of success, although limited, not inconsiderable in application to manufactures. The experience of other countries, the best practical guide in our own, demonstrates that such open markets are eminently useful in their connexion with agriculture. Under judicious regulations and salutary provisions for the preservation of order, and securing fairness in the conduct of

business, they may doubtless be rendered advantageous to our citizens, allowing choice and competition in purchases, without the disturbance of those scenes of tumult and blood-shed which disgrace the riotous and debased population of other lands whenever assembled.—*Nat. Egis.*

Theme for Thanksgiving Sermons.—Some clergymen in this vicinity have suggested the propriety of delivering sermons on Thanksgiving day on the subject of general education—such as is contemplated by the establishment of Lyceums. We could mention the names of some distinguished ministers who have promised to make this subject the theme for their sermons on that day of gladness; we know of no subject more appropriate at this time, when efforts are making to elevate the standard of education in this country higher than it is in any other country on the globe.—*Palladium.*

Incredible barbarity.—Wood was formerly so scarce in Patagonia, and cattle so plentiful, that sheep were driven into the furnaces of limekilns to answer the purpose of fuel. We should not have dared to repeat this fact, however undoubted, if a decree of the king of Spain, prohibiting the barbarous custom, were not still preserved in the archives of Buenos Ayres.—*Mem. of Gen. Miller.*

The Minister of a country church having complained to one of his parishioners that he often saw his eyes shut during the sermon. "Aye, Measter Parson," said the humpkin, "thee doesn't think I hear wi' my eyes, do'ee."

Horticulture.—A correspondent observes that he has seen the nectarine this summer in great verdure, strong and flourishing, while the peach trees around it were decaying with the "yellows." He suggests as an experiment, the inoculation of the peach buds on the nectarine stock, leaving at the same time some of the nectarine shoots to grow with the peach.—*N. Y. Statesman.*

Five pork.—Mr. Smick, of this place, slaughtered five hogs, which weighed together 1,501 lbs. One of them, (though not the heaviest,) was upwards of a year old; the other four were of one litter, and were less than eleven months old. The weight of the largest was 329, and of the smallest 268. We are of opinion this was the finest lot of pork which has been lately exhibited in this neighborhood, especially when the age of the hogs is taken into consideration.—*Hunterdon (N. J.) Gazette.*

HINT TO STAGE OWNERS, AND OTHERS WHO TRAVEL IN CARRIAGES IN COLD WEATHER.

The inconvenience and suffering, which arise from cold feet, while riding in stages in the winter, are obviated in the north of France, by means of pewter tanks, made after the manner of water plates, fitted to the bottom of the stages, and filled with hot water at each stopping place, which impart not only warmth to the feet in the coldest weather, but a pleasant glow of heat through the whole stage.

MOWING LAND.

It is a bad practice to feed your mowing land very closely in the fall. There should be enough grass left to protect the roots of the grass against the frosts of winter. We have known very good farmers, who would not suffer their mowing land

to be pastured at any season of the year. But if the land be in good condition it can be but little injury to pasture it in the fore part of autumn. It is necessary, however, to be particularly careful not to let cattle run on mowing land while it is wet, and so soft that they can make an impression with their feet.

TO PREVENT YOUNG FRUIT TREES FROM BEING DESTROYED BY MICE.

When the earth has been deeply covered with snow for a few weeks, we frequently find many trees in our nurseries and young orchards injured, or perhaps destroyed by mice. To prevent their excursions and lessen their number, it has been recommended to tread the snow down very firmly about the roots and bodies of the trees, to the distance of two or three feet from them. This will make the snow too solid a mass for them to penetrate, and probably destroy many of them in their nests. As these animals require warm nests to sleep in, all the materials with which they cover themselves, such as grass, weeds and stubble, should be removed from nurseries and young fruit trees. Particular attention is required for those trees, which are placed near to a wall, as it affords a secure and comfortable shelter for mice. No kind of manure which can harbor mice should be laid about your fruit trees.

Gunpowder, &c.

Du Pont's Gun Powder, at 23 to 50 cts. per pound Shot Balls Flints and Percussion Caps.

Also, Alum Refined Salt Petre Blue Viol. &c. constantly for sale at the *Dupont Powder Store*, No. 65 Broad street—By E. COPELAND, Jr.

The Du Pont sold as above, is warranted first quality—and is marked "E. Copeland, jr. Boston," on the head of the cask if March 14

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr. Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordeaux, Clerac, and Buzet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1829.

Mr. A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 100; and 15 cents for less than 50 roots. Payment to be made on delivery of the roots. Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 85 Wall street, Boston, E. Copeland, Jr. Albany, R. M. Michael, Philadelphia, Van Amringe, Baltimore, Willard Rhoads, Washington City, Wm. Patro, Richmond, Davenport, Allen & Co. Savannah, Hall, Shapter & Tupper, New Orleans, Foster & Hutton, Charleston, (S. C.) J. & J. Street Co. Mr. A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal booksellers of the United States; and his agents will furnish them gratis to subscribers.

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be published to-morrow, the *New England Farmer's Almanack* for 1829. By Thomas G. Fessenden, Editor of the *New England Farmer*. For sale, wholesale and retail, at the N. E. Farmer office, No. 52 North Market street, by Bowles & Dearborn, 50 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office

HORTICULTURE.

FOR THE NEW ENGLAND FARMER.

FIRE BLIGHT.

MR FESSENDEN—Fire blight is still employed to denote the *new* malady which destroys our pear and apple trees; and the cause, by many, is imputed still to the malignant influence of the solar rays, which, since the world began, have given life, growth and maturity to the vegetable creation. *Vide N. E. Farmer*, vii. p. 19.

It is a sound axiom that like causes produce like effects. If the sun does the mischief, why has it not done the like for centuries before? Has the benign influence of its rays changed; or have the laws of vegetation altered, within the last few years? The tumors on the plum and Morello cherry, which in some districts have operated to the almost entire extinction of these valuable fruits, have been ascribed to a spontaneous extravasation of sap, and to other equally erroneous causes. But it has been satisfactorily shown, by eminent naturalists, as well as practical gardeners, that this disease originates from the poisonous puncture of an insect, probably but a short time among us, which operates upon the vegetable blood like the poison of a rabid animal upon the human system, causing disease and death. But as the circulation is infinitely more rapid in the animal than in the vegetable, the cure in the latter is more easy and certain. Governed by this opinion I have persevered in cutting off and burning the diseased branches until I have overcome the evil, although some gardens in the vicinity are as much afflicted as ever. I have some thousands of the plum and Morello cherry on my grounds, and have found but one diseased tree among them during the season, and that came into my possession last spring. Forty years ago the Hessian fly was unknown to us. New enemies to our crops are annually recognized in the insect tribes.

I do not believe this disease is produced by the sun; because its attacks are indiscriminate, where the sun's rays are obstructed by foliage, as well as where exposed to its rays; on the north as well as the south; on horizontal as well as perpendicular shoots; and on the under as well as upper side.

I dissent equally from the theory, that it is occasioned by any deleterious matter in the soil; because it occurs where the soil has undergone no apparent change; and because, were this the case, the whole system of sap wood, through which the juices circulate before they become vegetable food, would be alike affected, and first the roots and trunk.

I object to every opinion which goes to ascribe it to atmospheric influence; because this influence would exert itself first on the leaves, the most sensitive and exposed organs, and the extremities would invariably give the first indications, which is not the case.

I do not believe it peculiar to any particular variety; because it attacks my apples as well as pears. It most abounds where the wood is most thrifty and tender. My Poir d'Auch, Winter butler and Priestley apples have suffered most.

It ill becomes me, after objecting to other theories, to set up one of my own, without ample proof to support it. But as my only object is to excite investigation, and elicit truth, I hope I shall be pardoned for my presumption in suggesting it, unsupported as it is by anything but casual observation and reflection.

My theory is, that the new disease of the pear and apple trees, like that of the plum and Morello cherry, is occasioned by an insect which injects a matter through the bark, that poisons or vitiates the descending sap, and causes disease and death. And my reasons for this opinion are briefly,—

1. That the progress of the disease is *down*, with the elaborated or proper sap, towards the trunk and root; and not *up*, with the ascending sap, towards the extremities and leaves; that it is perceptible to a greater extent on the cambium, and inner bark, than on the exterior surface.—The former will be found brown, in longitudinal slips, sometimes an inch lower than the exterior is affected. The sap frequently continues to ascend, is elaborated, and nourishes and preserves the verdure at the extremity, after the branch is affected, and the whole circle of the bark below become brown and withered; and in these cases it is not until the sap-wood under the blighted part is contracted by disease, and refuses to perform its office, that the extremity perishes.

2. That the commencement of the disease, from what I have stated, is in the descending sap, is communicated next to the bark, and finally to the wood.

3. That it is most common in thrifty branches, tender bark, and new wood. And

4. That it appears only when the sap is in full flow, and vegetation luxuriant; and extends in proportion to the vigor of circulation and growth.

What the insect is that does the mischief I will not pretend to determine. I have seen insects, in the morning, so firmly attached to a branch (at the commencement of the new growth) of an apple tree, that cutting off the limb did not disturb them; and at evening I have found many of them enveloped in the dead and curled leaves of a branch which they had probably destroyed in part. As I am no entomologist, I submitted them to a gentleman of science, who gave them the generic name of *saperda*, the specific name not being known.

J. BUEL.

Albany, Nov. 7, 1828.

CANADA THISTLES.

I was amused, Mr Editor, by the directions for destroying Canada Thistles, in vol. vii. No. 3, of your paper, which directed to "cut off each thistle half an inch below the surface of the ground, and then put on a gill of coarse salt."

This is very much of a piece with the directions I received when a boy, for catching birds, by putting salt on their tails. Pray what will your correspondent charge for putting his theory in successful practice upon an acre of thistles? or can he tell how much salt it will require?

Philosophy, as well as experience, conclusively prove, that *mowing* them off two or three times in a season, particularly when in blossom, will effectually destroy this pest of our farms, without the

application of a gill of salt. Repeated defoliation will destroy any tree or plant with which I am acquainted. Leaves are necessary to the growth of plants, and they cannot live without them in summer. A few years ago, whole forests of sugar maple were killed by the caterpillar destroying their leaves about mid-summer. The white mulberry is very tenacious of life, and yet were it *entirely* and repeatedly stripped of its leaves it would die. I have lost hundreds of young plums and cherry trees the last summer, by small black lice which attacked and destroyed the foliage of the new budded stock. Leaves are to the vegetable what the stomach is to the animal—the organs of digestion, which convert food into nutriment.—And without this nutriment the plant nor the animal cannot long subsist. The Canada thistle has diminished in west Vermont, nine-tenths within my recollection. They are annually cut *above* the ground, and have not, I believe, been dosed with either salt or pickle.

RUSTICUS.

Albany, Nov. 12, 1828.

YELLOW LOCUST.

You have recommended, in one of your numbers, the sowing of yellow locust seed in March. I sowed once the last of April, and lost nine-tenths of the young plants by frost. The seed, after being scalded, comes up as speedily as corn, and is as tender as the bean. It should not be sown before the bean.

Albany, Nov. 14, 1828.

FOR THE NEW ENGLAND FARMER.

FOREST TREES.

MR EDITOR—From the suggestions of a number of your correspondents on the subjects of cultivating timber and woodland, I am induced to try the experiment upon a field, which I wish to describe to you; and to ask your advice, or that of some of your correspondents upon the following points, viz:

The most valuable kinds, taking into consideration the value of timber, wood, the kind of soil, &c. The soil on the field to which I allude, is light, and worn out by long tillage. One third part of the field, say five or six acres, is a level of a sandy loam, mostly sand, entirely free from stone, producing very little grass or herbage of any kind—will yield a fair crop of English or winter grain, when ploughed once in five or six years. Another third part of the field is hilly, sandy, and gravelly, inclining to wash or gully; the other third part is gravel or loam, also hilly producing more herbage and grass than either of the portions before described. The timber, which is of natural growth around this field consists of the pitch or yellow pine, the oak, chesnut, poplar, &c.

The yellow locust, as described in your paper, is a fine valuable tree, which I would most gladly attempt the cultivation of, on the lot described, if there was a fair prospect of success. If the soil, or any part of it be deemed the most suitable for the cultivation of the yellow, pitch or white pine, what is the best method of stocking it, either by seeding or transplanting, and when is the best time of doing it? Also, the same query with regard to oak or chesnut, which might be thought

as suitable as any kind, for that part of the field, which has the strongest soil.

I wish, also, to make some enquiry, and to get some information, through the medium of your valuable paper upon the use of Gypsum or Plaster of Paris. There are various and contradictory opinions in this part of the country, and in the town where I reside, on this subject. Some farmers, who some years since, made an abundant, and without doubt a profitable use of it for the time being, have discontinued it altogether. Their opinion is, that it never enriched the soil; it only tended, by its action upon it to a rapid drain of its most valuable properties, leaving it, after a few years in a more unproductive and barren state than before; with this disadvantage also, a great difficulty of bringing it into a state of fertility again, by the application of other manure. If this be matter of fact, the question to be decided, and on which I wish for information is whether any, and if any what kind of use of this article can be permanently and profitably carried into effect.

Any discussion on the nature and properties of this article, or of its uses as a manure, and also any information upon any part or the whole of the above communication will greatly oblige a subscriber, and reader of your paper. A. K.

Vernon, Conn. Oct. 30, 1828.

Remarks by the Editor.—The above article invites us into a very wide field of discussion and investigation, which we shall not attempt fully to explore. We will, however, give some remarks which may, perhaps, be useful, and will be much obliged to our correspondents for further notices relative to the same inquiries.

With regard to the kinds of trees which it would be advisable for A. K. to cultivate in the field which he has described, it would not be possible for us to say which would prove most profitable. We cannot tell what may be the actual or relative prices of different sorts of timber in that vicinity, at the time when A. K.'s plantation might be productive. But, we believe, that those sorts, which spring up spontaneously, on any particular soil, may be most easily raised by art. According to our correspondent, the timber of natural growth around his field, consists of the pitch or yellow pine, the oak, chestnut, poplar, &c. These are valuable, the poplar, however, is worth, we believe, less than the other kinds enumerated.

The following directions with respect to the culture of the Chestnut, are abridged from the works of several authors.

Soil and site. The Chestnut flourishes on poor, gravelly and sandy soils. It is, indeed, a certain and quick grower on every kind of soil, except heavy clays, or soils generally wet, on which it makes slow progress. Loudon says "the chestnut prefers a sandy loam with a dry bottom; but will grow in any soil on a dry sub-soil. Distribute the plants towards the northern boundary of orchards; and in larger groups, over any vacant tracks, in extensive pleasure grounds or parks, and to form spacious avenues, or a row along any out boundary. A great number should not be placed close to a residence, as the smell of the flowers is offensive. Plant them [for the last time] at not less than thirty feet, and thence to fifty feet distance.

The work entitled "*Gleanings in Husbandry*" says the land for the chestnut "should be trenched to a depth from 15 to 18 inches; by this process, the upper, which is usually the best soil is sub-

verted, to the great advantage of the roots; and the under-soil brought up to the beneficial influence of the atmosphere." That it is increased from nuts dibbled in February, [March in this country] 3 or 4 inches deep, having been preserved during winter in sand. The quantity to an acre 4 bushels," or "By grafting; this is a more certain way of continuing a good kind than by nuts."

Mr Ira Hopkins of Cayuga, N. Y. in a letter, published in *Memoirs of the New York Board of Agriculture*, says, "Influenced by a desire to do something for posterity, I determined to plant a field of chestnuts. Accordingly in the fall of 1821, I procured about a peck of nuts, and kept them very choice until the setting in of winter, for fear of their being destroyed by the mice and other vermin. In December I planted them four feet apart each way; but not one of the seeds came up.

"Determined to persevere, in the fall of 1822, I obtained about the same quantity of nuts, and immediately planted them about four feet apart, as before, and covered them superficially with leaves and light earth. Most of them came up, and they appear to grow well.

"I am of opinion that if farmers would take a little pains in this way, they might, at a trifling expense, have a growth of timber coming on to supply them with fire wood and fencing stuff, when our old forests have disappeared. As chestnut will sprout and grow rapidly, I am told that it will do to cut off every 25 or 30 years."

In remarking on this communication, Jesse Buel, Esq. editor of the *Memoirs*, &c. observes, "The following fact has been related to us as evidence of the luxuriant growth of the chestnut, and its power of reproducing a new growth, during the natural decay of the old wood. Our informant stated that when a boy he assisted his father to cut down a chestnut tree, which was converted into shingles, and used in covering a barn. Thirty years afterwards he cut down one of three sprouts, which had started up from the stump of the old tree, and obtained from it shingles to replace the old ones, which had been laid thirty years before on the barn.

"In the interior of Pennsylvania, extensive tracts are devoted to the growth of chestnut timber, in the vicinity of forges and other iron works; and this timber is cut off at intervals of sixteen years and converted into charcoal. What stronger evidence do we want of the value of this wood, or of the economy of making plantations of it in time upon light or waste lands?

"In the propagation of forest trees by seeds, the natural process by which they are produced will be our best guide. Some seeds become rancid without great care, almost as soon as they fall from the parent stock. Such is the case with the seeds of several kinds of magnolia. The only way in which these can be preserved, we are advised by Michaux, is, as soon as they are gathered, and before the pulp, which surrounds the seed is withered, to mix them with rotten wood, or with sand slightly moistened; where they are kept cool till they are committed to the ground. Others are enveloped in an acrid pulp, and a hard shell, so firmly cemented as to require the lapse of a year, or the violent and repeated alternations of heat and frost to excite germination. Such are the seeds of most kinds of thorn, (*crataegus*). And others again which fall with the leaf, such as the chestnut, walnut, butternut, &c. (and we may in-

clude the seeds of the stone fruits) should never be suffered to become dry before they are deposited in the earth. We annex Michaux's method of planting the chestnut, from his *North American Sylva*, vol. iii. page 13.

"After the ground has been carefully loosened, with the plough and harrow, lines are drawn six feet apart, in which holes about a foot in depth and diameter are formed at the distance of four feet. A chestnut is placed in each corner of the holes, and covered with three inches of earth. As the soil has been thoroughly subdued, the nuts will spring and strike root with facility. Early in the second year, three of the young plants are removed from each hole, and only the most thriving is left. The third or fourth year, when the branches begin to interfere with each other, every second tree is suppressed. To insure its success, the plantation should be begun in March or April, with nuts that have been kept in the cellar during the winter, in sand or vegetable mould, and that have already begun to vegetate." [TO BE CONTINUED.]

From the Baltimore Patriot.

MR. MUNROE.—On reading the reports of the several committees appointed to award the premiums of the late Cattle Show near Baltimore, I observed that the committee on *Asses and Mules* express a regret that neither Jennies nor Mules were exhibited, for premiums; I have hastily thrown together my ideas of the valuable properties of the Mule for agricultural employment. If you think them worthy an insertion in your useful and widely circulating paper you will please to insert them, and oblige
A FARMER.

THE MULE,

When compared with the horse for the general purposes of agriculture (in Maryland) has certainly many advantages. First, they are much longer lived, I think I am justified in saying double when put to hard service and exposed. The late Col. JOHN E. HOWARD, had a pair that worked thirty years, at the expiration of which time he sold them to a carter in Baltimore, then in good health, and they performed well for many years after. There are several Mules now in Baltimore county that were twenty-five years old last spring, some on the farm of GEORGE MERRYMAN, Esq. and some are on the farm of MICAJAH MERRYMAN Esq. they are now in good order and perform well—there are many that are twenty years old, and have been at hard work eighteen years of age that were sold at public sale a few weeks ago at fifty three dollars each, besides these there are many that have been at hard work from twelve to fifteen years that would now sell for one hundred dollars each.—SECONDLY, the great saving of food, which on a fair calculation, I consider to be one third or in other words, six ears of corn is as great feed for a mule as eight for a horse; in confirmation of this, I have the opinion of Mr. Green late manager at Hampton, and many others in Baltimore county who have long used the mule in agricultural pursuits. Upon this principle, nine pounds of chopped rye for a mule is equal to twelve pounds for a horse. Agreeably to this conclusion, I will attempt to show what is saved in the article of food alone. If chopped rye be used the saving will be three pounds per day, and in a year 1095 lbs.; calculating chopped rye at one dollar per hundred, the saving in a year will be \$10 95 Hay in proportion at five dollars per ton 2 43

Making a saving in one year of \$13 38 and in ten years of \$133.80. Thus it appears that in ten years which may with propriety be considered far short of the average time of a mule's service, it will save its first cost in the article of food alone, and be a good mule then. And furthermore, they are not liable to so many diseases which frequently afflict horses, viz: *colic's ailment*, the *glanders*, *heaves*, *yellow water* and *cholera*, and they seldom are afflicted with the *spavins*, *ring-bone* or *botts*, and they will not founder. Admitting what I have stated to be correct, there can be no doubt of the superior advantage to be derived from the employment of the mule in agricultural pursuits instead of the horse. And the question naturally arises, how are we to procure a stock of good mules. I will give my opinion as brief as possible; do away the prejudice which prevails in Maryland, and in almost every place where mules have not been bred, "that a mare will bring but one mule, and that after having had a mule she will never bring a colt," however absurd this may appear to gentlemen of general information, it is nevertheless cherished by many persons who have not made the experiment, and is the principal reason why those who have kept Jacks in Maryland have not found it profitable. As nothing but actual experiment will overcome this prejudice, I would suggest the propriety of offering a premium of two dollars for every mule two years old raised in Maryland and ten dollars for the best Jack which should sire the most foals in a season, the number to exceed twenty. Should this method be adopted and continued three years, I think much good would result from it, and after that I am confident that the farmers would find a sufficient inducement to raise mules instead of horses, and I am confident that from the large mares of Maryland and Pennsylvania, a larger and better stock of mules can be produced than was ever raised in France or Spain.

☞ We had an opportunity of seeing in the month of September last a very large and handsome jack which was imported into this place direct from Malta, and which we understand has since been sent to Caroline county, eastern shore of Maryland, where he is to stand the next season, when the farmers in that and the neighboring counties who wish to substitute the mule for the horse to work on their farms will have an opportunity of sending their mares to him.—*Editor of the New England Farmer.*

INTERESTING FACTS.

Stated before the Merrimack (New Hampshire) Agricultural Society, October 15, 1823.

"Though our mountains are of no other use at present, than to attract the visits of travellers, for their height and sublimity, their bowels may hereafter disclose mineral riches in abundance, and their bases become surrounded with flourishing towns and villages, supported by labor on the materials yet undiscovered.

"One of the humblest of our Alps affords the richest iron ore in the world, already furnishing employment for thousands; and so far advancing the population, industry and wealth of the State; and articles, not now dreamed of, will hereafter become sources of wealth, and subjects of exportation. Permit me to mention a single fact that will warrant this prediction. Lieut. Amos Abbott, of Concord, owns part of the hill where our State Prison stones are quarried. The whole of this hill

was considered by the old proprietors of that town as of little value—and I believe the sections owned by Mr. Abbott cost him less than 50 cents per acre.

"In July, 1823, he sold from his tract a single rock in its native state for \$150. Mr. Parker, the purchaser, sold it, rough split, in the yard of our State Prison, to the Warden, for \$1300, who realized for it in Boston, \$6,129. This single rock made 10,500 feet of facing stone and ornamental work—and the aggregate weight of all the blocks (smooth hewn) was 550 tons, it having lost only 50 tons in being prepared for the market, after it was brought to the prison yard.

"The walls of one church in Savannah, and another in New Orleans, have already been constructed of our Concord granite. Twenty years ago we should as soon have thought of exporting gold dust and diamonds from the sands of Soncook river, as rocks from Rattle-snake Hill, to build up and embellish the cities of the South.

"Our New-Hampshire Granite is a more valuable mineral than the gold of North Carolina, or any other gold: as the granite requires hardy toil and industry to prepare it for the purposes needed. Neither does the thirst for its possession, or its preparation and use, prove an incentive to vice, but on the contrary the best corrective of the vices in the pursuit of the other."

TRANSPLANTING TREES.

It is a notorious fact, that of the number of trees transplanted in our public walks and streets for many years past, particularly on the Battery and in the Park, at least three-fourths have never vegetated at all, and of the few that have, no small number of them have died the first season, and the remainder are now as it were, struggling in a sickly state between life and death. The sole cause of which is, they have all been set a great deal too deep in the ground, and the consequence has been that the bark above the root has become rotten, and extinguished all vegetable life.

The few that have escaped this catastrophe, will, if examined, be found to have entire new roots, formed above the old, and the latter possessing no vegetable life whatever. *Nature plainly shows how deep all trees ought to be planted.* To set them in the least deeper than they originally grew, is dangerous; to set them much deeper, fatal. Those that have been set out in the public walks in this city, have generally been planted a foot or more deeper than they naturally stood, and it is the height of absurdity to expect such to live and flourish, with so great a proportion buried in the earth, which by the law of nature grew in the open air.

To bury animal life and expect it there to live and mature, is not more preposterous.—In unusually exposed situations to guard against injury by high winds, it is only required to shorten the tops, and otherwise trim them; but on no account whatever ought any part before nursed by its native air to be buried in the earth.—*N. Y. Journ. Com.*

Cancer.—A person who signs his name Thomas Tyrrel, in a communication for the Missouri Republican, states in substance that he was afflicted, for many years, with an inveterate cancer, and submitted to several surgical operations for cutting it out, which merely increased the evil. He was, however, eventually cured by the use of the lye of the ashes of the Red Oak bark, boiled down

to the consistence of molasses. With this substance he covered the cancer, and about an hour afterwards applied a plaster of tar, which was removed in a few days, and the lye again applied. These processes were repeated till the patient was cured.

Grain Prospect.—Were we to judge from the present appearance of our grain fields, we should predict for the farmer abundant crops the next season. In the district of country round about Wilmington, the wheat presents a most promising appearance. We have seen as yet, no traces of the fly: but on the contrary, the fields present one regular carpet of rich, luxuriant green. We congratulate our farmers upon the present favorable prospect: and hope that neither *fly*, *rust*, or *mildew* may interfere to destroy a rich and abundant harvest.—*Delaware Advertiser.*

Cranberries.—We are informed that a farmer in Mendon gathered last fall off of 6 acres of meadow 1300 bushels of cranberries, for which he received 50 cents per bushel. He had purchased the land but a short time before for \$12 an acre, receiving thus more than 900 per cent. upon the cost of his land.—*Lancaster Gazette.*

To prepare water-proof boots.—Boots and Shoes may be rendered impervious to water by the following composition:—Take 3 oz. spermaceti, and melt it in a pipkin, or other earthen vessel, over a slow fire; add thereto six drachms of Indian rubber, cut into slices, and these will presently dissolve. Then add of tallow, 8 oz.: hog's lard 2 oz.; amber varnish, 4 oz. Mix, and it will be fit for use immediately. The boots or other materials to be treated, are to receive two or three coats, with a common blacking brush, and a fine polish is the result.

Preservation of buildings from fire.—Dr. Fuchs, Professor of Mineralogy at Munich has invented a composition, which, on being applied to wood, is said to preserve it completely from fire. It consists of 10 parts of potash or soda, 15 parts of sand, and one part of charcoal; which are first melted together, and then dissolved in water. It may be applied either by itself, or mixed with earthy matter.

Alpine Plants are not, as commonly supposed, of a hardy nature, but the reverse. On the Alpine mountains they are deeply buried in snow during the winter—covered, as it were, with a pile of warm blankets, and thus effectually secured from the frost; and when the summer arrives, which is both later and much more rapid in its advance than with us, they are suddenly exposed, not to a temperature such as that of our spring, but to heat equal to that of the hottest of our dog days.

Large Leaf.—At the last meeting of the Ross Horticultural Society, a leaf was exhibited of the Oriental Palm, or talipot tree, which had been taken from a tree in Ceylon, upwards of 100 feet high, and was presented to the Society by the lady of Gen. Sir Robert Brownrigg. It measured no less than forty feet in circumference.

A farmer in South Carolina, during the last year sold Wine to the amount of two thousand four hundred dollars, the product of four acres of land.

SEEDS FOR SOWING.

No part of the farmer's or gardener's business ought to be more carefully attended to than the procuring of proper seed; the failure of crops in quantity or quality, is as frequently to be attributed to neglect of this precaution, as to any other cause. We recommend the judicious advice on this head, given in a little work, entitled "The New-York Gardener," by P. Agricola, an excellent little manual replete with sound maxims and useful information.

"If the seeds of plants are in many particulars like bird's eggs, you will see the necessity and impudence of always selecting the best and most perfect of their kind for seeding. As you would certainly choose the finest animals for breeders, so let your vegetable stock spring from the soundest and best seed; for it is not sufficient that your seeds *come up*; they should *come strong and vigorous*, if you would have them grow with luxuriance.

"Every year endeavour to improve your seed. Most of our cultivated plants are found to degenerate, notwithstanding all the care we can bestow upon them, unless their seeds are frequently changed. This fact has been long noticed, although the true cause may not yet be known.

"And we are also unable to say from what part of the world they should be brought, to produce the greatest crop. It is, however, generally found, that in all cases when you desire a great weight of roots or foliage, as beets, potatoes, cabbage, lettuce, etc., it is best to procure seed from a southerly climate.

"Whenever you use seed brought from a distance, let it be planted separate from any other of the kind, and note down all the particulars relative to it, that you may learn whether it is truly an improvement or otherwise. Much care is also requisite to prevent a deterioration of your seeds.—Whenever you would raise seeds from plants of which there are different species, do not set them within fifty feet of each other.

"This precaution is particularly necessary, whenever you would raise seed from any of the brassica tribe. This family has more branches, or varieties, than almost any other.

From the drum-head cabbage to the humble turnip, there are many grades, all of which have such seminal relation, that if permitted to flower in the neighborhood of each other, an admixture of pollen, and consequent adulteration, is certain to ensue.

"The varieties of the gourd family are also very numerous, and when you intend to preserve the seed of any of them in purity, or aim at improvement, plant them in separate and distant sections of the garden. In particular, the cucumber and melon should never grow together. They have each their peculiar excellence, which is materially injured by an union. So all the varieties of pumpkins and squashes are spoiled by an intermarriage.

And in like manner, all the kinds of Indian corn will mix their qualities, if they grow within four or five rods of each other. Your sweet corn will be quite ruined, if only a few stalks of the hard kind are permitted to grow near it, and what is singular, the sweet corn alone will suffer from the adulteration, the grains of which immediately lose their soft, rich and saccharine quality while the other appears not in the least affected. Your seed corn should always be gathered before the frost.—Search for such stalks as bear two or more ears, and take the largest of them for seed. Let them

immediately be trussed up, and suspended in some dry place, secure from rats and mice. Here it should remain until wanted for use. When shelled from the cob, reject the grains that grow upon each end. These hints should never be neglected, nor should you plant seed corn that is more than a year old, if new can be obtained.

N. Y. Farmer.

PLYMOUTH COUNTY CATTLE SHOW.

The annual Show was held this year at South Bridgewater, on Wednesday the 5th inst. The Show of cattle exceeded that of most former years, and the concourse of citizens was uncommonly large. An excellent dinner was served by Capt. Pratt, of which 100 persons partook. After dinner, at two o'clock, a procession was formed and proceeded to Rev. Mr. Hodges' meeting house, where the audience was amused and instructed by a learned and eloquent address from Rev. Samuel Deane, of Scituate, in which, says the Plymouth Memorial, "The orator happily illustrated the advantages which had resulted to the community from the establishment of agricultural institutions recommended the encouragement of agricultural publications, and of the mechanic arts—a judicious distribution of premiums for improved modes of agriculture, and condemned the disposition which prevails among many farmers to add to their number of acres, rather than to improve the quality of what they already possess. He also recommended, in strong terms, an application to our State Legislature for a geographical survey of the Commonwealth in order to aid the progress of agriculture."

The following premiums were awarded viz.

Alpheus Forbes of Bridgewater, for the best crop of English hay, having raised 9262 lbs. per acre on 3 acres of land, \$10

Also for the best crop of Rye, having raised 26 bush. 3 p. 29 qts. per acre, 8

Thaddeus Howard Jr. of West Bridgewater, best crop of Indian Corn, 109 2-3 bush. on one acre, 10

Abram Washburn, 2d of Bridgewater, best crop white beans, 16 bushels and 2 qts. on one acre of land, 8

Peleg Barker of Pembroke, best fat Ox, 8

Avery Forbes of Bridgewater 2d best do, 6

Solomon Perkins for the best milk Cow, 8

Morrill Allen of Pembroke, for 2d best do, 6

Anasa Alden of Bridgewater, for best Heifer, 5

Also for the 2d best do, 3

Galen Howard of West Bridgewater, for best Bull, 8

Lorenzo Wood, 2d best do, 6

John Tilden, Jr. of North Bridgewater, for the best Bull Calf, 5

Abram Washburn of Bridgewater, 2d best do, 3

Also for 1st and 2d best Heifer Calves, 6

Sam'l E. Sanger of Bridgewater, for best Pigs, 5

Charles Packard of North Bridgewater, for the best yoke of Oxen, 8

Solomon Copeland of West Bridgewater, 2d best do, 5

Ebenezer Pratt of Bridgewater, for best yoke of Steers, 6

Ebenezer Alger of West Bridgewater. 2d best do, 4

LEATHER.

The following facts are derived from the New York Journal of Commerce. The sales of sole leather in the city of New York amount annually

to about a million of dollars. The leather is sold to the shoe manufacturers in New York, New Jersey, Connecticut, Virginia, Ohio, Canada, &c.—About 250,000 hides are imported annually into the city, chiefly from South America; and over 100,000 hides are purchased for the numerous tanneries in Greene county, (near the Catskill mountains.) There are almost inexhaustible forests of hemlock in that county, and the fact has been established by repeated experiments, that hemlock bark contains a greater weight of tannin than oak bark. There is a prejudice in favor of the color of leather tanned by oak bark, but it is well ascertained that the durability of both kinds of leather is the same. The leather is returned to market in ten months from the purchase of the raw hides in the city. The process, for manufacturing with more speed, has been abandoned.—The longer the leather is in a process of manufacturing, within due limitations, the better it will be.
Hampshire Gazette.

SHOOTING MATCHES.

Shooting matches, viewed in their best light, are a just theme for reprobation. In the first place, the sport is cruel, and therefore cannot be justified. Any amusement which causes pain to any part of the animal creation, is so far wrong—for although the brute species are given to man for subsistence, their lives are by no means to be made the subject of wanton sport. But the evil effects of these shooting matches upon the morals of the community are incalculable. Every autumn is closed with these brutalizing sports. The young men, and even some of the old ones, abandon the useful and necessary labors of the field and the workshop, and congregate by hundreds to shoot at a miserable victim of a turkey cowardly tied to a stake, or to look on and witness the sport. Many of these are poor men—day laborers or mechanics—who will lay out their earnings in powder and ball, and spirituous liquors which are drunk on the occasion, while their creditors are defrauded of their just dues, and their families are suffering at home for the mere necessaries of life. And then the scenes of drunkenness and quarrelling which so frequently attend on these occasions, are an outrage upon decency, and a blot upon humanity. And all this, that some petty dealer in grog may bring together crowds of people who will fill his coffers by emptying his bottles, or that some miserly farmer, who has raised a brood or two of turkeys, may have more money out of them than the honest market price. The above is no exaggerated picture of shooting matches in their best estate. But if we add to it the danger to human life, and the many fatal accidents that actually occur, the picture is sufficiently appalling to deter every man of decency and good feelings from engaging in such sports.—*Berkshire American.*

The Thames Tunnel is now entirely at a stand. A brick wall has been completed at the further extremity of the excavation, which being made water tight, prevents any water oozing in that part, and also does away with the fear entertained, that if left in its unfinished state, another break in of the river might be the consequence. The water the Tunnel makes (if we may use the expression) at present is very trifling, and the whole of the interior is as fresh and firm as before any accident happened. The workmen with the exception of a very few hands who are employed in thoroughly removing every appearance of the late

disaster, have been discharged, and even the few now at work, will in another week, be no longer needed. It has been proposed, in the event of the sum of £100,000 being raised, to commence working from the other side of the Thames as far as they can go; and in case of the water breaking in, as they approach the dangerous part, which is the centre of the river, building up a similar wall to that now placed at the end of the present works and afterwards completing the centre by means of the cofferdam. If such a plan be in contemplation, it must be attended with considerable expense; but is, perhaps, the most likely to ensure the completion of the undertaking.—*London paper.*

BONES OF THE SOLDIERS AT WATERLOO.

It is well known that the bones of animals make an excellent manure for enriching the soil, and accordingly are very much sought for by gardeners and agriculturalists in the neighborhood of large cities, as London and Paris. When thus used, they are first broken, then ground by means of a steam engine, and the powder sown upon the land.

After the battle of Waterloo, the bodies were first searched over for money, watches, trinkets and clothes.—Then came the purveyors of human hair, for the supply of the makers of false hair—wigs, curls and frizzettes; then came another class who extracted from the dead bodies, all the sound teeth, for the supply of the dentists, and lastly when the flesh had putrefied, the collectors of bones for manure searched the field for their harvest. This looks like barbarism. The idea of it is revolting to humanity.—*Richmond Fam. Visitor.*

HORTICULTURE IN NEW BRUNSWICK.

The circumstance of Grapes, the produce of this Province, having been sent to the city, as we noticed last week, has led to our making further inquiry respecting the extent to which the cultivation of the vine has been attended to, in order to ascertain whether or not, practical experiment will bear us out in asserting that our climate is suitable for it. The enquiry has even exceeded our expectation. The wild grape abounds in various districts of the Province, particularly in sandy soil, and several gentlemen have, during last year, made transplantations of the vine, with the view of improving the fruit, and of bringing it to an early state of perfection. A farmer from Grand Lake states that his attention had been for several years past, strongly drawn to the importance of the subject, from seeing this fruit in its wild state perfected on particular parts of his farm—he has now appropriated part of his garden as a vineyard, and furnished it with a sufficiency of the soil in which he observed the wild plants to thrive. We entertain no doubt of the success of the experiment; it is deserving, however, of public notice, in order that others, similarly situated, may be induced to follow the example.

We are informed also that, both last year and this, very fine grapes have been produced at St. Andrews, in the open air, in the garden of Christopher Scott, Esq. The public press, both in Nova Scotia, and likewise in this Province, has, without doubt, done much for the advancement of their agricultural concerns; we should like much to see it exert itself in forwarding their horticultural interests. While it has been usefully employ-

ed in rousing the community to the belief, that we can be independent of foreigners for a supply of the necessities of life, let it not be backward in showing, both by the adducement of facts and the publication of practical information, that our situation on the globe furnishes us with the means of being independent of them for many of its luxuries. Indeed, from the enquiries we have made, and the information received from different quarters of the Province, we are perfectly convinced that nothing but inveterate obstinacy and determined sluggishness, stand in the way of our not being abundantly supplied from the interior, with many descriptions of apples, pears, plums, cherries, currants and gooseberries:—If to this variety be added our wild fruits, say raspberries and strawberries, which are no where produced in greater abundance than in this Province; who can say that the comforts of life are not entirely within our reach.

It is gratifying to learn that the planting of Orchards is yearly becoming an object of increasing interest among our farmers; and the day is not far distant when our market will be plentifully supplied with the article of cider, both for exportation and home consumption:—Mrs Clarke of the Grand Lake, will gather this year about 2000 bushels of apples, and a gentleman in this City, will have by the month of June next, 1900 fruit trees planted on his farm near this city. When it is considered that this fruit can be so plentifully produced, with scarcely any injury to a surface crop, it is rather matter of surprise than any thing else, that the subject has been so long neglected by our agriculturists. The different modes of manufacturing cider, both in Nova-Scotia and in the United States, we shall take an early opportunity of noticing.—*St. John (N. B.) Courier.*

BRONCHOTOMY.

A boy in Fryeburg, Me. who had taken the core of an apple into his windpipe a few days since, was relieved by the operation of cutting into the windpipe, called Bronchotomy. In Stockbridge, the core of an apple was extracted from the windpipe of a little girl, by Dr. Brewster, a few days since. An incision an inch in length was made in the fleshy neck of the child, and the windpipe opened; a tube was inserted below the obstruction, through which the child breathed; the core of the apple was then extracted by means of a piece of sponge attached by a string to the end of a catheter, which entered the windpipe above the tube and came out at the mouth. Without this operation the child could not have survived but a few hours; it now gives every hope of a speedy recovery.—*Hamp. Gazette.*

Fat Ox.—A noble fat ox raised in Worcester, by Governor Lincoln, came down the canal last week, and was sold at auction by Mr. Stoddard, for seventy one dollars. The ox is to be exhibited on our shambles this day for sale. The finest roasting piece has by order of Governor Lincoln, been reserved for the Governor of this State.—*Prov. Journal.*

John Bartram, A quaker and self taught philosopher, was born near Darby, in what was then Chester county, in 1701, and was the first who established a botanic garden in America. He corresponded with many distinguished foreigners, and was pronounced by Linnaeus the greatest natural botanist in the world. He was finally appointed

American botanist to George III. He is said to have been a very ingenious mechanic, and to have built, with his own hands, the house in which he resided. He quarried the stone, prepared the timber, and engraved the following distich in front of the building, on its completion.

"To God alone: the Almighty Lord,
The Holy One, by me adored."

John Bartram, 1770

[Prepared by the Editor.]

BEEES.

FROM THE NORTH AMERICAN REVIEW.

(Continued from page 134.)

Straw hives are unsuitable for our climate, and afford a harbor for all kinds of insects. It is folly to talk of their cheapness. If a man intend to keep bees, he must in the first place, make the hives in the very best manner; by this we mean of good materials and good workmanship. A hive badly joined by an awkward carpenter is worse than a hollow tree. One half of the labor of the bees, is directed to the repairs of their dwelling.* It is not asserted that bees will of themselves, fall into these hives, or that no trouble or expense is necessary in the management of an apiary. We know that both care and expense are required;—but the latter, after the first disbursement, is very trifling. Vigilance and neatness are forever in requisition, and the care of bees like all other profitable business, cannot be pursued to any advantage, unless it receives daily and minute attention. But have we not accomplished a great deal when we have reduced the thing to this certainty?

But although, as we have before observed, nothing is more simple in theory and practice, than the history and care of bees, yet it requires a constant and unremitted attention if we aim either at the instruction or profit. Can any thing be well done and to advantage without these? Varro, in his treatise, *de Re Rustica*, is the first who has spoken of hives. He wrote upwards of 1,780 years ago; and how many different sorts of hives have been constructed since his time, to say nothing of the different theories? We wish to see bees in every garden throughout America, but we have no desire to see the subject encumbered more than is necessary to advance the pleasure and profit of the pursuit. To the naturalists we will leave discussions of organization and propagation. They are foreign to our purpose, as they only serve to perplex and deter us from the main points. But it is proper to know the most simple mode of managing a hive, and this includes the pasture or food that is necessary for its sustenance. Hunger destroys as many bees as the millers. We ought to cultivate such shrubs and plants as the bees like, without this they will starve. The American black willow and the red maple are the first trees that are visited by the bees. They are fond of the crocus, which is earliest of the bulbous roots; and these we can have in abundance, as they multiply quickly and occupy but little space. They are beautiful in themselves, affording a rich treat to the eyes; and they flower so early, and are of such bright and vivid colors that we take as much pleasure in them as the bees do. The stercorary and piggery are next resorted to by these insects. These we presume are their medicine shops, and

* A model of the hive which we consider of the best construction, may be seen at the village of the Lebanon Shakers, in the hands of Daniel Hawkins; or at the seat of Theodore Sedgwick Esq. in Stockbridge. The inventor of this hive has had an opportunity of judging of its merits by experience.

the extract absorbed from them must be used as a tonic. Blossoms of all kinds, excepting those of the red clover and of the honey-suckle are excellent food; and the bees especially profit by the increased attention bestowed at present on the cultivation of the peach tree in some parts of the country. They not only drink the nectar and extract the pollen of the flower, but they appropriate the peach itself. We have seen twenty or thirty bees devour a peach in half an hour; that is, they carried the juices of it to their cells. The humming bird alone can reach the bottom of the nectary of the honey-suckle, but even here the instinct of the bee is seen. The small birds, such as the wren, make an incision on the outside, near the bottom of the flower, and extract a part of the juices. The bee takes advantage of this opening and avails itself of what is left.

The scent of the bees is so acute, that every flower which has a powerful odor can be discovered by them at a great distance. Strawberry blossoms, mignonette, wild and garden thyme, herbs of all kinds, apple, plum, cherry, and above all, raspberry blossoms and white clover are delicious food for them, and a thriving orchard, garden, and apiary fitly go together.

But as the bee seeks only its own gratification in procuring honey and in regulating its household, and as, according to the old proverb, what is one man's meat is another's poison, it sometimes carries honey to its cell, which is prejudicial to us. Dr. Barton, in the fifth volume of the American Philosophical Transactions, speaks of several plants that yield a poisonous syrup, of which the bees partake without injury, but which has been fatal to man. He has enumerated some of these plants, which ought to be destroyed wherever they are seen;—namely, dwarf laurel, great laurel, *kalmia latifolia*, broad-leaved moorwort, Pennsylvania mountain laurel, wild honey-suckle, (the bees as we have observed cannot get much of this) and the stramonium or Jamestown weed; which last we should wish to see completely eradicated, as independently of the poison, extracted from its flowers, and from its seeds which are often eaten by children, it is the ugliest weed that grows, and has the most offensive odor.

The poets, always exalting and magnifying the subjects that they touch, have contributed, perhaps, more than any other set of writers to mislead our judgment. They endow the bee with memory, and Rogers thinks that it finds its way to the hive by this faculty alone. Nor is it only with regard to the bee, that poets, the worst entomologists in the world have lead us astray.

Cowper says,

"I would not enter on my list of friends
Though grac'd with polish'd manners and fine sense,
— the man
Who needlessly sets foot upon a worm."

By *worm*, we wonder if he included the grub-worm. Alas! little did that amiable man think of the mischief that would ensue from this sensibility and tenderness towards insects. He thought that when nature created them, and designed them an abode, that it was a species of cruelty to hunt or harm them, when not actually crawling "in the glove, the chamber, or refectory." But the harm that the few do, which so inadvertently approach our dwellings, is insignificant when compared to the ravages of every kind of insect excepting the

bee when in the abode that nature assigned it.* This very worm, from which they bid us turn aside when we meet it in our path, after destroying the roots of our pasture and our corn, becomes a winged insect, and continues its mischief to the destruction of our finest fruits.

We really are in a sad plight between our sensibilities and our sense of justice to ourselves.—We say that insects have so multiplied, that we can neither raise grain for our cattle, nor fruit for ourselves. "Keep the birds near you," say the philosophers—"quit the cruel practice of shooting the harmless songsters of the grove, and you will not only be rewarded by seeing that insects decrease, but you will be charmed by their melody." But then, we say in answer that the birds do not discriminate; that they prefer bees to every other insect, and therefore the birds must die. And in reality we must make war upon those birds, that show the greatest fondness for our little friends. Let us, at least, show our sense of the value of these, by keeping their enemies away, at any rate from their very doors. Let us lessen the chance of their encountering them abroad, by planting the favorite food of the bees as near the apiary as possible; and also lessen the chance of their being drowned when driven by high winds, as they stoop to drink, by giving them running streams near to their lives. * * * *

In the hive of a new swarm, during the months of July and August, there are fewer small bees, than in one that has been tenanted for four or five years. The bee, like all other insects, spins itself a covering before it becomes a fly. When it emerges with wings from its cell, several older bees approach it, feed it with the contents of their stomachs, and then clean out the cell and deposit in it fresh honey. This is their constant practice; and the bee that is just born, as soon as it has been fed and has stretched its wings, flies off to a flower, and commences its labors. But although the bees clean out the cell the moment a young bee is born, yet they either find no inconvenience from that part of the film, which the young bee leaves at the bottom of the cell, (and which is of a silky nature,) or they are unable to detach it. In consequence of this the cell is not so deep, and as the same circumstances occur perpetually, brood alternating with honey, the cells become every year visibly smaller; and, consequently, those bees that are bred in these small cells, of which there is a great number, are never of the full size of those that have had more room. Even the queen eggs, which we say are often deposited in the cells of neuters, and have afterwards larger cells attached to the first, never produce so large a queen bee, as if the cell had been of the proper dimensions at first. Thus we see that the contraction of the cell may diminish the size of a bee, even to the extinction of life, just as the contraction of a Chinese shoe reduces the foot even to uselessness: but in neither case will a single new organ be taken from or added to the bee, or a single toe be taken from or added to the foot, whether the cell or shoe be larger or smaller.

(To be concluded in our next.)

AMERICAN LYCEUM.

These scientific institutions, so well calculated to accelerate the march of mind by adding the

* Other insects, however, beside the bee are very useful to man. Among the number are the Cochineal insect, the fly which gives birth to the gall-nut, the silk worm, &c. &c.—Ed.

pleasure of social intercourse to the profits which result from intellectual acquisitions, seem to be attracting a large share of public attention. We are happy to perceive this, and at all times willing to devote our pen and paper to so important an object. It has been well suggested in several of the newspapers in this City, and Commonwealth, that the institutions, proposed under the name of American Lyceums, might well be recommended in Thanksgiving discourses, and the evening of that day be laudably and usefully employed in organizing such associations for mental improvement.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOV. 21, 1828.

INSECT ON FRUIT TREES.

A correspondent, with the signature "M." in a communication, dated Wrightsville, York county, Pennsylvania, gives an account of an insect and its ravages, as follows:—"The first appearance of the insect, which I noticed was on a earthouse apple tree, in the spring or summer of 1827. The appearance to me resembled the blossoms of Timothy or some small grass, shaken on the trunk of the tree, when wet with dew, and remaining on it.—After which they appeared to increase in size to about the bigness of shot No. 8, cut in two, and a little lengthened; and formed a cover, adhering to the bark, under which the insect, whatever it may be, was found. On rubbing them with the finger nail or point of a knife, there seemed to remain a liquid, darker colored than venous blood. They stick very tight, having resisted, in a great measure, my attempts to rub them off on a damp day, with a stiff hand-scrubbing brush. Their progress appears to be from at or near the ground, into the branches, when the stock or stem is free from them, but the bark is left rough and cracked in many places, and I have observed streaks on it, resembling a place over which a dark colored liquor had flowed. While on the trunk (although at first round and smooth) a raised and depressed muscular appearance is produced, which is often found on our black hawthorn, and admired in canes of that wood. The tree on which I first discovered it does not appear to have increased in size since first planted, and I think will not live another season. It was from a nursery in Lancaster county, Pennsylvania.

I afterwards found the insect, very injurious on the summer pearmain, summer bough, and yellow harvest, obtained from Burlington, N. J. growing on the opposite side of the orchard, but on the summer rose, (from Burlington) growing with the pearmain, &c. I found none of it. The juicy bite and rambo are badly affected with it, as also the Newton pippin; but the Bellefleur, Vandever, and Winter sweet Paradise are nearly clear of it. I have seen a little of it on some pear trees obtained from Mr. Primee, of Long Island, last spring. Last summer, whilst looking at one of the Jersey trees, which was affected with it, I discovered a dark colored insect on the body of the tree about the size and shape of a small grain of coffee, with a bristly coat, and no wings, (at least I saw none) and slothful in its movement, which I killed. I then on the same tree, found two more, and on another affected tree near it two others. Can this be the insect which deposits the eggs?

Last summer I washed the trees affected, with corrosive sublimate, about four times the strength

necessary for herpetic affections of the human skin; but it does not appear to have done any good. The orchard stands on a strong limestone soil, has been under cultivation ever since planting, and the trees have been brushed with soft soap, every spring, as recommended by Mr Prince. Every tree of the earthouse has it.

I have thus far intentionally avoided the use of white-wash on young trees, but unless informed of something else, which may be more effectual, I think I shall try it; but where the disease has extended to the twigs, I am at a loss how to apply any thing like a wash."

Our correspondent has some further remarks and inquiries, relative to the management of fruit trees, which we hope to take notice of hereafter. The insect, which he has described is new to us, and we have found no account of any thing similar in any books, which we have been able to consult. We should be much obliged, to Dr. HARRIS, or any other gentleman, who may possess information relative to this destroyer, for such notices of it as may prove interesting to the entomologist, or useful to the orchardist, by showing some method of guarding against its ravages.

We are requested to state that the Gage plum tree which produced the large quantity of plums that were sold for above *forty dollars* in our market, (as mentioned in the New England Farmer of October 3d) was obtained by Mr. Samuel R. Johnson, the proprietor, from Mr. Prince's nurseries at Long Island, and is of a variety originated by Mr. Prince, from seed, and called the *white gage*.

Winter Keeping for Horses in the vicinity of Boston.

Where the most faithful care may be relied on, may be had on application to Major Samuel Jaques, Charlestown, or Mr. T. J. Niles, School Street, or to Mr. Russell, Publisher of the New England Farmer. An early application is desirable.

Kenrick Nurseries.

100 Choice varieties of Ornamental hardy trees and shrubs, just received from New York, and selected in June last.

This establishment situated but an hour's ride from Boston, contains a very extensive assortment of Apples, Pears, Plums, Peaches, Apricots, Quinces, Grape Vines, Mulberries, Currants, Raspberries, Strawberries, &c. and a general assortment of Ornamental trees, shrubs, &c.

Also, the following fruit and ornamental trees of *extra sizes*, viz. Flowering Horse Chestnuts, Mountain Ash, Weeping Willows, Ailanthus, Catalpas, Purple Acacia, Dutch Cork Elm (a new article) Butternuts and Silver Firs.

300 Isabella Grape Vines; and White Mulberry Trees by the thousand.

Written orders addressed to John or William Kenrick, and directed to the Newton post office, will be promptly attended to, or they may be left at Mr Joseph Bridge's Grocery and Seed store, Court street, Boston, where lists of the above may be seen. Trees will be packed in mats for shipping, when ordered, and delivered in Boston free of charge. 3d Nov 21

Moody's Patent Portable Oven.

This Oven, which is constructed for doing all the ordinary baking of a family, over a common cooking furnace, is now offered for sale at the Agricultural Warehouse, 52 North Market Street.

This highly useful article for domestic purposes may be said to be one of the most economical and useful inventions that has ever been offered to the public, its size is varied for the convenience of large or small families, it is used with the common cooking furnace, and it is known that the same quantity of meat or pastry cannot be cooked so well and in any way with so little expense. Nov. 21. Sw.

Bremen Geese.

For sale 10 pair fine Bremen Geese. Apply at the New England Farmer Seed Store. Nov. 21.

Wanted,

On a farm in Roxbury a young man who has a knowledge of farming and can bring recommendations for industry &c. Apply at this office. 3d. Nov. 7.

LINNEAN BOTANIC GARDEN AND NURSERIES, near New York, *William Prince*, Proprietor.—The new Catalogues of this establishment are now in the press, and may soon be obtained from T. & J. Swords, New York, and of the other Agents. The collection of Fruit Trees has been nearly doubled since the last edition, and comprises all the choicest varieties of every country. The assortments of Ornamental Trees, Flowering Shrubs and Plants, Greenhouse Plants, &c. have also been greatly extended, and in fact every department has received the utmost attention both to their extension and improvement. The grounds occupied by the establishment have been extended to 40 acres, and the proprietor can now justly state that orders for every description of Trees and Plants will be executed in a manner superior to all former periods. The Cherries, Peaches and most other Trees are of large size—many of the Peaches, Apricots and Nectarines are on Plum stocks. The collection of Grapes consists of above 20,000 ready for sale, comprising all the choicest varieties, and will be shipped in quantities at reduced rates, and 100,000 more are expected shortly from France and Germany. Without intending injudicious comparisons, the proprietor appeals to those acquainted with his establishment as to its decided superiority in every department. The whole management and supervision is attended by himself and sons, and orders received from any distance receive the same pointed attention as if the persons were on the spot to make their selections. The trees are packed in the best possible manner to ensure success, and with the greatest despatch, and are shipped to any place designated. And to those interested in Horticultural pursuits, he has only to say, that the same unremitted attention will be paid to the execution of its business, which has hitherto characterised the establishment. N. B. Plants of Wilmot's Superb Strawberry, and the celebrated Greville Rose can be supplied. nov 11—8

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordeaux, Clerac, and Bazet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1822.

Mr A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 100; and 18 cents for less than 50 roots. Payment to be made on delivery of the roots. Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 65 Wall street, Boston, E. Copeland, Jr. Albany, R. M. Michael Philadelphia, Van Amringe, Baltimore, Willard Rhoads Washington City, Wm. Patro, Richmond, Davenport, Allen & Co. Savannah, Hall, Shapter & Tupper New Orleans, Foster & Hutton Charleston, (S. C.) J. & J. Street Co. Mr A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal booksellers of the United States; and his agents will furnish them gratis to subscribers.

New England Farmer's Almanack, for 1823.

In press at the New England Farmer office, and will be published to-morrow, the *New England Farmer's Almanack* for 1823. By Thomas G. Fessenden, Editor of the New England Farmer. For sale, wholesale and retail, at the N. E. Farmer office, No. 52 North Market street, by Bowles & Dearborn, 50 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office.

Subscription for Vine stock for the finest table Grapes.

A. Parmentier, at the Horticultural Garden, Brooklyn, corner of the Jamaica and Flatbush road, two miles from New York, having been urged by several lovers of the vine to propose sets of the best kind for sale by subscription, offers to the public sets of a dozen vines, with good roots of the most select and choice grapes for the table; many of which are quite new in this country, and all of which will ripen perfectly in any situation either in town or country.

Names of the twelve Sorts.

1. White Chasselas, with large fruit
2. Chasselas of Fontainebleau, near Paris
3. Yellow Chasselas of Thomery, near Paris

4. Golden Chasselas, the real genuine
5. Musk Chasselas
6. Chasselas, with very large black fruit
7. Red Chasselas
8. White Muscat, or black Constantia
9. Red Muscat
10. Black Muscat, or black Constantia
11. Black Orleans, bears very well the frost
12. Black Gamet, yields a second crop of blossoms and fruit when the first are frozen.

Nos. 11 and 12 are as fine for vineyards as for the table, the fruit is not so excellent as that of the preceding kinds, but is equally valuable on account of the certainty of a large crop annually.

The subscription receipt will be accompanied by directions on the best mode of cultivation, planting and pruning the vine.

The same sort of vines may be had separately, price One Dollar, except No. 4, Golden Chasselas, the genuine, which is Two Dollars. Communications for the above, and subscriptions to his establishment post paid punctually attended to.

References, Dr. David Hosack, President of the Horticultural Society, Dr. F. A. S. President of the Linnean Society, Dr. McNeven, Dr. Mitchell, Dr. Stevenson, and Hon. John Lowell. Nov. 11.

Wine and Table Grapess.

A complete assortment of FRENCH VINE ROOTS in prime order, just received and for sale at a low price, by E. Copeland Jr. at the Dupont Powder Store, 65 Broad Street. F. AMMUNITION as usual. 3d.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

The collection of LILIES is very splendid, comprising Scavlet Chalcidorian Lily 50 cents, Orange Pomponne Lily 37 cents, Chinese Leopard 25 cts, Orange Martagon 37 cts, Yellow Martagon 37 cts, Double Violet Flamed 37 cts, Purple and White Spotted 37 cts, Bright Scarlet Pomponne 50 cts, Double White 37 cts, Large White Garden Lily 12 cents, Dwarf Chinese Red Lily (*Lilium concolor*, new and very superb, one root only) \$1.50

HYACINTHS—(double and single,) dark blue, porcelain blue, red and rosy colored, pure white, white with yellow eye white with rosy eye, and yellow with various eyes; from 25 cts to \$1.00 each.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots, 33 cts. each.

JONQUILLES—sweet scented, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 38 cts. each.

DOUBLE NARCISSUS—fragrant, of all colours, 19 cts. each. SPRING CROCUS of all colours, 6 cts. each, 50 cts. per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 3 1/2 in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the mere refuse of the most inferior collections, good roots being worth at home ten times as much, as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts. a paper. They were gathered by a gentleman familiarly acquainted with the sorts, expressly for us. They will be sold by the single paper, or packed to order, in any quantity. A description of several of the trees will be found on page 131 of this week's New England Farmer. Among the assortment is the following Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for us—For sale by the lb. or ounce.

Grape Vines.

On hand, well packed in moss for transportation, a good collection of Grape Vines, at the nursery prices, 50 cts. to \$1.00 per root.

New England Farmer Seed Store,

No. 52 North Market Street—Boston.

Pear Trees and Grape Vines.

For sale at the house of Samuel Downer, in Dorchester, 200 Pear Trees of the choicest varieties. 100 Isabella and Bland's Virginia—200 native and 200 Sweet Water Grape Vines from 2 to 5 years old. Also, a variety of Rose Bushes, Ornamental trees, white lilies, &c. Apply to Rufus Howe on the premises Dorchester Nov. 21. 3d.

MISCELLANIES.

Truth and falsehood. It is most dangerous to deviate from truth, even on the most trifling occasion. However guiltless may be our intentions, the habit (if indulged) may take root, and gain on us under the cover of various pretences till it usurps a leading influence on our conduct. Truth is born with us; and we must do violence to nature to shake off our veracity. Plutarch calls lying the vice of a slave. Flatterers—those who continually praise themselves, and speak ill of others; and those who affect to depreciate the advantages they enjoy, and to exaggerate those of others, ought never to be believed on their word. We gain nothing by falsehood but the disadvantage of not being credited when we speak the truth.

Spend prudently. What folly lays out in kid-skin gloves in ten years, managed by prudence might fill a small purse. Are not white dollars worth more to a farmer than white hands? If your finances are small be not ambitious of owning a three story house. A humble cottage is a good beginning. Enter at the "*little end of the horn*," and you may see at the other an elegant house large enough for the thrifty farmer.

Lying. Lying is so infamous a vice, that we should avoid it even in jest. Exaggeration is a species of falsehood. In whatever words you express your meaning, if they convey not to others the sense in which you understand them yourself, you are a deceiver, and speak not the truth from your heart.

Solicitation. In soliciting any thing, it is better to move by speech, than by letter; your person, expression, and delivery may claim regard, and the person solicited may not have confidence to give a denial—but at a distance he may write a letter without blushing.

Goodness. To be virtuous, you must be something more than merely innocent. A man to be good must do good, that is, he must be actively engaged in pursuits, which have a tendency to benefit himself, or his fellow creatures.

Adversity borrows its sharpest sting from our impatience. Our good and evil proceed from ourselves. Death appeared terrible to Cicero, indifferent to Socrates, desirable to Cato.

Men in office should be men of business. He who is too indolent or too careless to attend properly to his own business, ought not to be entrusted with that of the public.

Punctuality. Be punctual even in trifling matters; for failing in little things will cause you to fail in a greater, and render you suspected.

Justice. Though justice be not commonly sold, yet it costs much, and it is necessary to be very rich to obtain it.

Prosperity. He who is puffed up with the first gale of prosperity, will bend beneath the first blast of adversity.

OLDEN TIME.

In 1637, there were but thirty-seven ploughs in all Massachusetts, and the use of these agricultural implements was not familiar to all the planters. From the annals of Salem it appears, in that year, it was agreed by the town to grant to Richard Hutchinson twenty acres of land in addition to his share, on condition "he set up ploughing."

1639. A summary act of the General Court prohibiting short sleeves, and requiring the garments to be lengthened so as to cover the arms to the wrists, and required reformation in "immoderate great breeches, knots of ribbon, broad shoulder bands and tayles, silk rases, double cuffs and ruffs."

1639. "For preventing the miscarriage of letters, it is ordered that notice be given, that Richard Fairbanks, his house in Boston, is the place appointed for all letters, which are brought from beyond the seas or are to be sent thither, are to be brought unto him and he is allowed for every such letter 1d., and must answer all miscarriages through his own neglect in this kind, provided that no man shall be obliged to bring his letters thither, unless he please."

1643. The Court order, that in the election of assistants, Indian beans should be used instead of paper, the white to be affirmative and the black negative.

1647. The Court order, that if any young man attempt to address a young woman, without consent of her parents, or in case of their absence, of the County Court, he shall be fined 4l. for the first offence, 10l. for the second, and be imprisoned for the third.

1649. Matthew Stanley was tried for drawing the affections of John Tarbox's daughter without the consent of her parents, convicted and fined 5l.—fees 2s. 6d. Three married women were fined 5s. each, for *scolding*.

1653. Jonas Fairbanks was tried for wearing *great boots*.

WITCHCRAFT.

The New England Galaxy, after a quotation from Judge Story's address, relating to the subject of witchcraft, introduces the following anecdote:

About the year 1760, the fury of the inhabitants of New England had declined towards suspected old women, but their believing fear was not altogether quelled. At this time a case of witchcraft occurred in Billerica under the ministry of the Rev. Dr. Cummings, who related the story with much satisfaction, as the last, which came within his precincts.

An old woman of very peaceable character lived pretty much alone in a shell of a house near the meeting-house and the clergyman's dwelling. She was suspected of witchcraft, by a family who lived at two miles distance in the west part of the town, and they brought accusation immediately to the parson: who in those early times, exercised not only the spiritual, but the temporal power of the parish; he was often council for both parties, and was judge and jury, without subjection to appeal—he was moreover a peacemaker—Mr. C. accused Mrs. D. of witchcraft. "How do you know she is a witch?"—"Because she has bewitched my mare." "How do you know that your mare is bewitched?"—"Because she won't stand still to be saddled, and the minute I get on, she kicks up and throws me off." "But what makes you think that Mrs. D. has bewitched her?" No answer. "Have you had a quarrel with her?" "Oh no! I can't had no quarrel." "But what is the matter? surely she would not bewitch her for nothing." "Why I carried her some corn on the mare about a week ago, and I didn't know but I might have made a mistake in the measure so that it fell short, and so"—"And because your corn fell short, you suspect that she found it out,

and is so angry as to bewitch your mare?" "Yes—that's it, and I want you to go and lay the devil." "Why, if you have raised the devil by cheating in the corn, you had better lay him yourself." "Yes, but I don't know how." "Go, then, directly, and carry the balance of the corn, and take good care never to commit such an act again: the devil is always busy with people who do not perform all their duties honestly."

The man slunk away home at this unexpected rebuke, and failed not to carry corn enough to make full measure, which, however, he feared to carry into the house to the old woman, but emptied it down upon the door stone. But the mare ceased not to kick as usual; whereupon Mr. C. came to the minister, told him what he had done, and begged for holy assistance. "Go home," said the parson, with all that energy for which he was so remarkable, "go home,—you need not trouble yourself about witches; I'll not allow them to do any mischief, I assure you—do your duty, so as to escape a guilty conscience, and if your mare is refractory, whip her as I do mine—go and let me hear no more about witches." Mr. C. obeyed, but he was far from convinced, that Mrs. D. was not a witch, and he determined to put it to the proof. For this purpose, he boiled a large potatoe, which he put directly from the boiling water, under the bewitched mare's saddle. The caperings and kickings of the poor beast were excusable this time, at least, for when after some hours the saddle was got off it was found that a severe mark was left behind it. The proof of the matter was to be in this; if the old woman had bewitched the mare, she would have the same mark of a burn on her back. Two old women were prevailed on to be of an examining committee. Dr. Cummings was requested to be of the party, with his Bible at hand, to prevent any fatal explosion from Satan's nostrils. This office he prudently declined. His place was filled with another old woman, and Saturday night was appointed for this examination. This time was chosen because the good people thought that Satan would not visit in holy hours. In the mean time the good woman got an inkling of what was going on; and as they entered a long dark entry they were saluted with a stupendous flash of powder and tow, and a glorious clatter of tin pans. The committee were scattered of course—and before church the next morning every body in the town knew, that the devil came, all covered with blue brimstone, to save his disciple, the wicked Mrs. D. This would have made a new era in witchcraft in the town, but for the pertinent remarks of the parson touching the matter; for he was enabled to dispense a word in season.

Box.

For sale a quantity of superior Box. Any person wishing for a small quantity, or sufficient to edge extensive walks or avenues, may at the present time, procure it on the most reasonable terms, by applying to Messrs. Winships' Nursery, Brighton Nov. 7, 1828. 3c.

Great sale of Wool.

ON THURSDAY, DECEMBER 18, AT 10 O'CLOCK,
At the Hall over the New Market.
219 bales Saxony WOOL, consisting of first and second Electoral—first and second Prima Secunda, and Tertia.
246 bags Leonessa Soriana Regoviana Spanish Wool.
130 bags Portuguese Wool.
420 bags (about 75,000 pounds) American Fleecce Wool, among which are some choice lots of selected Saxony and full blood Merino fleeces.
Catalogues will be ready for delivery and the Wool may be examined three days before the sale.
Coolidge, Poor & Head—Auctioneers.

HORTICULTURE.

FOR THE NEW ENGLAND FARMER.

MR. EDITOR.—I always read the New England Farmer with pleasure and improvement. Its purpose is a truly valuable one. This is, to instruct a large and important class in the community in what it highly concerns them to be thoroughly taught. Principles and facts are placed in it side by side. The doctrine and its illustration are brought together, and men are thus taught to think as well as to act. What has been done for our agriculturalists, our farmers, is now doing for the industrious classes of every order in the community. It is one of the distinguishing circumstances of these times, and will be recorded to our lasting honor, that the whole mind of the community is now every where addressed, and excited to put forth its whole powers, as well as for its own progress, as for the good of the whole. Agriculture has taken the lead in this noble effort, and it is fitting that it should have done so. This was the earliest human occupation, and its continued necessity, has been a continued appeal to every undertaking which could ensure its progress. I must leave these general remarks, however interesting it might be to extend them, for this communication has a special purpose.

In the last number of the Farmer (November 7) an account is given of Ma. Rice's method of making cider. I am too little practised in this art to criticize his method generally, though some doubt did arise whether *rotten* apples improve the liquor. What particularly attracted my attention was the quantity of NEW RUM to a barrel of his cider.—This is TWO GALLONS AND A HALF. It first occurred to me that this quantity was much too large; and a question immediately arose if any RUM at all were necessary.

Cider contains alcohol. This is the product of the fermentation it undergoes. This is not much to be sure, but it is quite sufficient to affect some heads. Great cider-drinkers are even sufferers in this way. They are dull sluggish men, with red, full faces; and if insanity occur in such individuals, a very obstinate form of this disease, and marked by characteristic symptoms is produced. In Mr. Rice's method the natural quantity, so to speak, of spirit is greatly increased; and as I think a very dangerous liquor is formed. Its popularity may in part be owing to its exhilarating properties, to the RUM, in short, which it contains. If, however, this be denied, it must be acknowledged that some of the bad effects of spirit cannot fail to follow its use. The stomach is affected in a peculiar manner by all the forms of alcohol. There is produced in this organ, a certain, a morbid condition, for though the immediate effects of ardent spirits be pleasurable, its remoter ones are any thing else. When the excitement has passed off, a sense of uneasiness and exhaustion almost invariably takes its place. This demands another dram. The quantity must be increased, for the morbid state of the stomach increases with the continuance of the habit, till at length nothing will satisfy it but a constant, a daily, hourly, use of ardent spirits.

This is the way in which the habit of intemperance is formed; and I would respectfully submit if there be not some danger that such habit may follow from the daily use of cider, which contains so much rum. If these views be in any measure correct, they deserve very serious attention. One of the most important classes in the community is interested in its decision. I cannot but think the danger exists, and did not feel that I was discharging my whole duty, without offering for your consideration these hasty remarks, and of requesting for them a place in your most useful publication. I have not needed the question of the necessity of any additional alcohol to what is natural to cider. If cider be faithfully made why should it not be sound, now as long as it did thirty years ago. I was a boy then, but I remember perfectly well, how good the cider of that day was. It was honestly made, in proper weather, of good fruit and put into clean barrels. Its fermentation was carefully watched, and when over, the barrel was accurately closed, and kept quiet till March. It was then bottled; or if meant to be kept in the wood, it was carefully drawn off the lees into clean barrels. NEW RUM, or BRANDY PIPES, or RUM HOGSHEADS, were not in vogue then. We drank, and relished, the native unadulterated juice of the apple. It is to be regretted that a false taste should in any way have been produced in the later times, and still more so, that false cider only will satisfy it. It is however not too late to correct the evil. This may be done, by making cider in such a manner that a moderate use of it shall not be an occasion of a man's becoming a drunkard. A PHYSICIAN.

Boston, Nov. 20, 1828.

[By the Editor.]

AGRICULTURAL IMPLEMENTS.

In purchasing agricultural implements, the following rules are to be observed: they should be simple in their construction, both that their uses may be more easily understood, and that any common workman may be able to repair them, when they get out of order; the materials should be of a durable nature, that the labor may be less liable to interruption from their accidental failure; their form should be firm and compact that they may not be injured by jolts and shaking; and that they may be more safely worked by country laborers, who are but little accustomed to the use of delicate tools. In the larger machines, symmetry and lightness of shape, ought to be particularly attended to; for a heavy carriage, like a great horse is worn out by its own weight, nearly as much as by what he carries. The wood should be cut up and placed in a position the best calculated to resist pressure; and mortices, so likely to weaken the wood, should, as much as possible be avoided; at the same time implements should be made as light as is consistent with the strength that is necessary. Their price should be such that farmers in moderate circumstances can afford to buy them; yet for the sake of a low price, the judicious farmer will not purchase articles, either of a flimsy fabric, or a faulty form; and implements ought to be suited to the nature of the country, whether

hilly or level, and more especially to the quality of the soil: for if they are calculated for light land will not answer equally well in soils that are heavy and adhesive.

FOREST CULTURE IN FRANCE.

This branch of rural economy is conducted with much skill and science in France, both as regards national forests, and private estates. In an article, written for Messrs. Wells and Lilly's Edition of *Deane's New England Farmer*, by J. LOWELL, Esq. it is observed that "The practice of the populous nations of Europe, where forests have been cut off centuries ago, and who are compelled to resort to measures of the strictest economy, to supply themselves with fuel, ought to have great weight with us. France, in particular, ought to be looked up to for wise lessons on this subject.—Her vast and thickly settled populations, her numerous manufactures, her poverty in mineral coal, the eminence which she has attained in all economical arts, entitle her to great respect. It is the practice of the French people not to cut off their woods oftener than once in twenty or twenty-five years, and by *long*, when they are cut over, the owner is obliged to cut the *whole* smooth, with the exception of a very few trees, which the officers of the government had marked to be spared for larger growth—without giving any opinion as to the propriety of the direct interference of the government on such a topic, we would say that the example proves that in the opinion of French scientific and practical men, it is expedient, when woodlands are cut, that they should be cut smooth, in order that the new growth might start together, not overshadowed by other trees of larger growth. We have no favorable opinion of the utility of cutting down trees in a scattered manner, as they appear to fail, and still less of planting acorns in thinner spots of the forest. The growth thus produced must remain forever feeble."

TURNIPS FOOD FOR HORSES.

An English writer says that when horses are fed on turnips, they are induced to eat the barn chaff, and other dry food with good appetite; are kept healthy and will work without grain. London says "the Swedish and yellow turnip are eaten greedily by horses; and afford a very nutritive and salutary food along with hay or straw for working stock. The best mode is to steam them after previously passing them through a slicing machine, as no root requires so much cooking as the Swedish turnip. Horses will also eat the white turnip, but not freely unless they have been early accustomed to them, as in some parts of Norfolk."

REMARKS ON TREES AND TIMBER.

London says that the period at which trees are felled, for the sake of their timber, is determined by various causes. By maturity of growth, or where the annual increase is so trifling as to render their standing no longer worth while in point of profit, when wanted for private use or sale; or when defects in the tree, or new arrangements in its situation point out the necessity of its removal. "A timbered estate," Marshall observes, "should frequently be gone over by some person of judgment."

ment; who, let the price and demand for timber be what they may, ought to mark every tree which wears the appearance of decay. If the demand be brisk, and the price high, he ought to go two steps farther, and mark not only such as are fully grown, but such also as are near perfection." In trees, as in the human species, there are three stages, youth, manhood, and old age. In the period of youth, the growth is rapid; in manhood that growth is matured; and in old age it begins to decay.

The most profitable season for felling timber is at what may be thus termed the beginning of manhood. After that time, though the tree may appear sound and healthy, its annual increase is so little, that it would be more profitable to cut it down and replant. The number of years that a tree may stand before it arrives at this period, must vary in different soils and situations; but the period itself may be easily ascertained, by the annual shoots, the state of the bark, and by taking the circumference of the tree at the same place for two or three successive seasons, and comparing the difference. In the view of profiting from timber produce, it is of great consequence to cut down plantations at maturity. Many trees will stand half, others a whole century, after they are full grown, appear quite healthy, and at the same time, make little or no increase of timber. But there are particular cases, arising from the nature and state of the markets, where it may even be more profitable to cut timber before it is arrived at its full growth.

ON FOREST TREES.

Continued from page 138.

The following notices of the Chesnut may form an useful addition to the remarks on the same subject, given in our last number.

M. Michaux states that "the European chesnut would be a valuable acquisition to many parts of the United States. This tree produces the nuts called *Marrons de Lyon*, which are four times as large as the wild chesnuts of America, and which are sent from the vicinity of Lyons to every part of Europe; they were formerly exported also to the West Indies. Kentucky, West Tennessee, and the upper part of Virginia, and the Carolinas are particularly interested in the introduction of this species. It already exists in the nurseries of Philadelphia and New York, and it is only necessary to procure a few stocks to furnish grafts for young wild chesnuts transplanted from the woods, or reared in the nursery.

"The chesnuts may be grafted by inoculation or the insertion of a shoot. The common method is by lopping a branch of the wild tree, removing a girdle of the bark near the end, from an inch to three inches wide, and replacing it by another from a limb of the cultivated stock of corresponding diameter. The lower edge of the new covering is exactly adjusted to the natural bark, but a portion of the limb is left exposed above, which is scraped down so as to form a species of tent or dressing, and the whole is protected from the weather by a coating of clay."—*North American Sylva*, vol. iii. p. 13, 14.

THE OAK. It appears by the description of our correspondent that oak is one of the sorts of timber, which is the natural growth of the soil in the vicinity of the field in which he proposes to cultivate forest trees. We may of course presume that oak would flourish in his contemplated

plantation, and we will subjoin some directions for raising that very valuable tree. *Hunter's Notes on Evelyn's Sylva*, give the following as the best mode of raising the oak:

Having the ground properly prepared (by breaking it up and reducing to a fine tilth, either by potatoes or repeated ploughings) and having a sufficient quantity of acorns, all gathered from the most vigorous, healthy and thrifty trees, proceed to the setting them in the following manner. In the month of February or March, let lines be drawn across the ground for the rows, at the distance of four feet from each other; but if this be thought too great an interval, the rows may be made three feet, in which case the acorns must be put down at a greater distance from each other. Then having sticks properly rounded to make the holes, (a common dibble) plant the acorns in the rows at ten inches asunder.* Let them be put down about two inches below the surface, and see that the earth be properly closed upon them to prevent mice or crows from injuring the seed. In some places it is customary to sow acorns after the plough in furrows, but where the ground happens to be stiff, great care should be taken not to cover the seed with too thick a furrow.

"The first year after planting the acorns the weeds must be kept down by hoeing and hand weeding, and this must be done early in the spring before the weeds get so strong as to hide the tender plants, which would occasion many of them to be destroyed in cleaning. It is also the cheapest as well as the neatest husbandry to take weeds down before they grow too large; for though the ground may require an additional hoeing in the spring, yet the weeds, being hoed down when young, a man may hoe over a great quantity in a day. Weeds cut in their tender state immediately die. Whereas when they are old and strong, they frequently grow again, in a short time, especially if rain follows soon after, they perfect their seeds, and thereby injure the whole plantation.

"The second year of their growth the common plough may be made use of to cultivate and keep the ground clean." The author then proposes a nursery in the same field to supply deficiencies, and continues:

"Having thus given directions for the raising of wood, I proceed to their future management.—And first, the rows being four feet asunder, and the plants two feet apart in the rows, they may stand in this manner for twelve or fourteen years, when every second plant may be taken out and sold for hoops or poles. After every second plant is taken away, let the roots of those taken away be grubbed up to give the remaining plants more room freely to extend their roots. The plants being now four feet apart each way, they will require no more thinning for seven or eight years, that is till they are twenty years old; when the healthiest and most thriving trees must be marked to stand for timber, and the others cut down for poles, and their roots left to produce future underwood.

"The oak will grow and thrive in almost any soil, if properly planted, though it cannot be supposed that their success will be equal in all places. A rich, deep, loamy soil is what oaks most delight

* The acorns should either be preserved in sand till they are planted in spring, or planted in the fall soon after they are ripe. If they become quite dry after being gathered, they are apt to lose the power of vegetation. See page 102 of the present vol. of N. E. Farmer.

in, though they will grow exceedingly well in clays of all kinds, and in sandy soils, in which last the *finest grained timber is produced*."

The author then investigates some disputed points relative to the culture of oaks, and inquires which of the different modes of raising them produces the most timber, from the acorn, the seed bed or the nursery. He decides in favor of *planting the acorn in the place where the tree is to grow*, and Mr Hunter adds, that whoever will look at the woods which were sown, and compare them with those which were planted from nurseries, will not hesitate a moment to declare in favor of Evelyn's opinion.

When it is wished to raise wood merely for fuel, it is recommended to suffer it to grow as thin as it will, and it is said that it will become sufficiently thinned of itself as it grows larger; but where oaks or any other trees are raised for timber, they ought to stand further apart, in order to have their growth rapid, and the timber firm and durable. No cattle should be admitted into the plantation till the trees are beyond their reach;—and at no time whatever, when young successive growths for fuel are intended.

FOR THE NEW ENGLAND FARMER.

CANADA THISTLES, &c.

MR. EDITOR.—Your correspondent "Rusticus" seems to be amused by the method suggested in vol. vii. No. 3 of your paper, for destroying Canada thistles with coarse salt. As a further amusement, I would recommend his putting in practice his theory of "mowing them off two or three times in a season," or, if he wishes to be still farther amused, I would recommend his adopting Dr. Deane's method, suggested in his Farmer's Dictionary, of pulling them up by hand, (especially if he performs the work without gloves) and I think he will find both these expedients about as successful as that of the boy who attempts "catching birds by putting salt on their tails."

Your correspondent inquires what I would charge, "for putting my theory in successful practice on an acre of thistles:" he is informed that this is not mere theory, but that I have destroyed them with brine and without even cropping—nor do I believe the cropping essential. As to the expense, I should suppose a horse load of salt, which I have seen sold at the wharves for one dollar and fifty cents, being salt that had been used for salting imported hides, would be sufficient to destroy the thistles of at least half an acre, and a man would perform all the labor requisite in three hours.

I have seen the method of mowing them several times in a season, practised several years in succession in Ipswich, where they abound; and could perceive no other effect than a tendency to prevent their spreading. As to your correspondent's philosophy of defoliation, to destroy trees and plants, it may be correct as it respects some species; but pray what will he charge to come and destroy by this process an acre of my barberry bushes, blackberry vines, or of the various kinds of bushes that infest our low lands? These I have cut in the height of their vigor, without much effect, but have seen the same killed with salt without much trouble. I doubt much if the common willow would be destroyed by divesting it of its foliage, at any season. If cutting a plant so tenacious of life as the thistle, will kill it, how

extraordinary it must be, that our tender grasses, (most of which are cut in the bloom, and often more than once in a season) are not destroyed by this means. A FARMER.

Lynn, Nov. 25, 1828.

AGRICULTURAL EXHIBITION.

A Cattle Show, &c. was held at Washington, Penn. by the Washington Agricultural Society, on the 16th ult. The official account sent us by a friend and subscriber, in that quarter of the country, being too long for insertion entire, we shall be under the necessity of abridging it.

The Committee state that the Show was respectably and numerous attended, and indicated a progressive improvement. Thirty stallions were on the ground, but several of those should never have been shown for premiums. A number of horses, however, were recommended for "combining the remarkable qualities of figure strength and action;" and the Committee call the attention of farmers to the importance of improving the breed of this highly useful animal. Experience demonstrates more clearly every year the superiority of those crossed with the pure blooded horse of England for every purpose except the road team; and even there (when size can be obtained) their superiority is acknowledged."

The whole number of Horses, Mares, and Colts on the ground was between 90 and 100. A fine Jenny and a very promising young Jack were exhibited by Mr. Walter Craig.

"The beauty of form and extraordinary weight of young Cattle excited universal admiration. It is perhaps worthy of remark (in order to show what may be done, even by the introduction of one fine animal) that every Bull on the ground, except two, were descendants of Mr. Reed's "Nonsuch," of the improved short horn breed."

Merino sheep not numerous, but all of a superior quality—specimens of wool equal to any Saxony.

Hogs deficient in number but showed a great improvement in quality.—"The Bedford breed, lately introduced into this country, are rapidly spreading, and as rapidly improving our stock.—Their docility, early maturity, and great propensity to fatten render them an important acquisition to the judicious farmer."

Domestic Manufactured Articles "were such as to call forth the admiration of every one who beheld them, and to furnish evidence (were evidence wanting) of the industry and taste of the ladies of Washington County." Several pounds of Sewing Silk "were exhibited, made by Mrs. Axtel, Riggs, Bombarger and Quail, and which we have no hesitation in pronouncing equal to any imported silk we have seen." The Committee likewise state "that we observed with much pleasure a young lady attending our Show, from an adjoining county dressed in most superb silk of a beautiful mazarine blue color, produced from worms, fed by her own fair hands during the last summer. Your committee would remark that the cultivation of the silk worm is very simple, and can be introduced among our agricultural pursuits with the greatest facility. It is within the reach of almost every farmer.—The mulberry grows spontaneously, and abundantly, and it requires only the labor of children to manage the worms."

Leghorn and Gimp Bonnets were exhibited and commended "particularly those made by Miss Ewart and Miss McClelland, the former of whom made upwards of 80 dollars and the latter 50 dol-

lars worth of these articles during the last year.

Such facts as these speak volumes in favor of the protecting system, and prove incontestably that if the unnatural advantage which foreign competition derives from the political depression of the laboring classes in Europe, is counterbalanced by an adequate importing duty, our home industry and skill will be able to manufacture from the products of our own soil, a sufficient supply of Cloths, Cottons, Silks and Bonnets without impoverishing our country to pay trans-atlantic artisans.

The Committee likewise recommend *Cabinet Ware* by Mr. Joseph Huston, Plated Ware, by Messrs. Hendricks & Morrison, *currant and grape Wine* by Mrs. Eckhart, &c. &c.

A statement of the weight of the Cattle, exhibited as above, may be found on the last page of this week's paper.

[From the American Farmer]

FOREST AND ORNAMENTAL TREES.

J. S. SKINNER, Esq.—I send you the following in answer to the queries of T. J. R. in the Farmer of the 7th November, so far as experience will warrant.

The maple (sugar,) sheds its seeds in September. This is the time to gather and to sow them. In the autumn of 1826, I gathered a bushel of the seed and sowed it. Not a seed vegetated in 1827, but last spring they came up abundantly. They were sown thickly upon a bed of light loam, and covered with an inch of earth. Their growth has been trifling; but after the second year, if put in nursery rows, I have found by experience that they become much more thrifty.

1. The soft, or white maple, sheds its seeds in May. On the 28th of May, 1827, I had a quantity of the seeds gathered and immediately planted. They grew two feet the first summer, and many of them which were placed in nursery rows last spring, are five and six feet high. This is one of the quickest growing trees we have, particularly on moist and wet soils, to which it is particularly adapted. It is ornamental, and makes good fuel after it has become partially dry.

2. I have repeatedly planted horse chestnut in April, with unvarying success, and have nearly four thousand growing, of different ages. The only precautions I would suggest, are, to take care that the nuts do not become heated and rancid, and that they are not covered with too much earth. From one to two inches is the proper depth to plant. They are fond of a rich, tenacious soil.

5. Beech masts are most successfully planted when they naturally fall from the tree, in autumn and should be slightly covered.

6. I have planted ash keys in April. A few came up the first summer, but ninety-nine hundredths of them did not vegetate until they had lain in the ground a twelve month. The white likes a kind loam; the black wet and gravelly locations. Those which came up the first season, and which have grown two seasons, are from two to three feet high.

7. I have not planted any walnuts but the black kind. They were put in the ground in autumn, and vegetated freely. Their growth is rapid since the two first years after planting.

9. Seeds of the mulberry may be planted on a bed of fine mould in May. I have hundreds, the seeds of which were sown in the spring of 1806. They will soon constitute a fine hedge, where protection from winds is desired.

11. The seed of the buttonwood may be gathered any time during the winter or spring, and sown in April. I sowed in the spring of 1827, and some of the plants are now four or five feet high. This tree may also be propagated by cuttings.

13. The common locust (*robinia pseudo-acacia*), is propagated by seeds and suckers. The seeds are surrounded by a glutinous shell impervious to cold water. They should therefore be steeped in water, nearly, or quite at the boiling point, and sown when you plant beans, as the plants are, when young, very sensitive to frost. When once established, it is difficult to eradicate them, as they send up sprouts wherever the root is sundered or bruised. They are of quick growth, and constitute a valuable timber.

The glutinous resembles the common in its appearance, habits and rapid growth, and is equally prolific in suckers. It flowers beautifully, but mine have not produced seeds.

The three thorned or horny locust, as it is called, (*gleditsia*) grows freely from such seeds sown in the spring. I have planted some thousands of these in hedge, with a strong confidence of their proving an excellent plant for live fence. Their growth is rapid, and the wood very hardy and compact.

14. I gathered and sowed the seeds of the elm, on the same day (May 28th) that I did the white maple. The best plants are now from two to four feet high.

I have had no experience with the birch, chestnut, tulip, pine or oak, and am only commencing my experiments upon the firs; and shall therefore say nothing of the manner of propagating them—except to observe, that nature is the best guide in these matters. Follow her laws; plant when the seed falls from its parent tree, and we shall seldom fail of success. Michaux's North American Sylva may be consulted by your correspondent with profit.

Your correspondent seems to be in the condition of a political candidate for office, perched on an eminence, a mark for every angry wind that blows. I advise him to remove into the vale, out of the reach of the envious elements; or if this cannot be done, to encircle his villa with all the variety of trees that will grow upon his grounds, and by no means omitting fruit trees and evergreens. They may be thinned and fashioned to his taste as they advance in growth. The seeds of all he has enumerated, and many others, may be easily procured; and the expense of nurturing the young plants will not be felt by a gentleman of his ardent in rural and useful improvement.

With an ardent desire that your correspondent's zeal may prove contagious, and that he may obtain a seat in Congress to reward you for your meritorious labor, I subscribe myself, very respectfully, your obedient servant. J. B.

Albany, Nov. 1828.

Propagating forest trees.—Sowing acorns, beech masts, ash keys, &c. in the autumn, when these seeds will fall spontaneously from the trees appears by much the most natural method; but the destruction made by the field-mouse upon these seeds, both at the time of sowing and during the winter, has induced many gentlemen to prefer spring sowing to the autumnal one. When spring sowing is determined on, the acorns and other seeds must be preserved in sand during the winter; and, in forming the magazines, care must be taken to keep the different sorts from each other.

Evangelist.

annually at least 40 acres of grain, *not one failure has been sustained either in wheat or in any other crop*, and I will venture to vouch, few farmers in England could make a similar assertion. In fact, I esteem my wheat crop as certain as any other; and as the plan I have pursued has been uniformly successful, a sketch of it may be useful to my brother agriculturists. The fields appropriated for wheat, in the rotation, are thrown up into drills during the preceding fall which not only renders the soil more mellow, by exposing a larger surface to the frost, but helps to destroy the weeds, prevents the land from being washed by the fall and spring rains, and enables me to work it much earlier in the spring. To sow early is essential to the success of this crop; for since the severity of our winters renders the use of our winter grain so precarious, it is indispensable that our farmers should, by early diligence and activity in the Spring, remedy this disadvantage to which the climate subjects us. I have raised hitherto but one variety of wheat the bearded kind, imported from Boston by the Central Board about nine years ago. I obtained my seed from a crop raised at Willowpark by Mr. Young. Before sowing I use every precaution in pickling and liming, according to the most approved directions—but this care has been hitherto bountifully rewarded by the excellence and cleanliness of my crop. The rust or blight has never struck it; and I regard the introduction of this variety as a benefit to our agriculture of inestimable value.

In my opinion it would be of essential advantage to our farming interests, were the turnip husbandry more widely prosecuted, for, independently of the value of the root; the *fallow* is an excellent preparation for the ensuing crop of wheat or barley. Many farmers run away with the belief that turnips are an unsafe crop, on account of the ravages of the fly; but I have now raised them for eight years without a failure, and the appearance of four acres of all kinds which I have this season is most promising, although the soil has been enriched only with the marsh mud—not a cart load of barn manure being applied to it.—The following method will render a turnip crop as certain as any other:—Select a loamy soil, plough and drill it as if for potatoes, deposit short dung (for it is necessary that the manure be well decomposed) in the drills, sowing them as soon as made, and while the earth is moist and mellow. No exertion should be spared to obtain *fresh seed*, and it would be advisable to prove its quality before placing it in the drills by sowing some in a flower-pot to see whether it germinate rapidly and with vigor. Two or three pounds are required per acre, and it ought to be buried, at least, one inch deep. By being placed at this depth the fibres draw more moisture, and sustenance for the infant plant is more speedily obtained from the manure. Their growth will consequently be quicker, which is a matter of first consequence, in order to put them beyond the reach of the fly, for the danger from the insect is only while the plants have put forth the germ or seed leaf. By being thickly sown they protect each other from the sun, and afford abundance to be cut off by the fly and the hoe.

To all my lands near the marsh mud I use no barnyard manure; for besides carting mud from the banks of the river, wherever the situation of the upland field to be enriched renders it advisable, I dig mud from my marsh fields where there

is a sufficient depth. This I have found to be an economical and excellent substitute, and the peculiar advantage I derive from this practice is, that it enables me to improve by back fields by laying upon them the undivided riches of the baryard.

In no part, however, of the system has the management I have pursued been more successful than in the melioration and improvement of my marshes. When I first commenced operations upon them, they were a perfect nest of weeds, and the thistle especially had obtained on them an almost indisputable dominion. The upper surface, from a long course of cropping, without the application of manure, was completely exhausted; in the language of Sir Arthur Young, they were a hungry wolfish surface, and the labor thus before me was not only to renovate their exhausted strength, but to cleanse them of this host of weeds. Contrary to the prejudice of many of our farmers, that deep ploughing would ruin the productiveness of the marsh, I threw up a deep furrow, and have now ascertained that the mixing of this virgin mould with the exhausted soil has rendered it quite as fertile as when reclaimed from the sea. Deep ploughing too, both on my marshes and upland, has had the effect of nearly rooting out the thistle, for when I first went to the farm, I could not spare either time or labor to weed more than one of my grain fields; but this season it has cost me little or no trouble to weed 33 acres, which I have under grain. It is a mistaken idea which some of my neighbors entertain, that the scythe is sufficient, for I know many fields where the thistle has been cut down year after year, in this way; and yet, year after year, they spring up with a renewed and irrepressible fertility. The following rotation I have found to answer well upon our marshes.

- 1 Year, Oats sown upon the lee furrow
- 2 do. Peas, black, excellent for fattening pigs or feeding horses
- 3 do. Wheat
- 4 do. Green crop in drills, potatoes
- 5 do. Wheat

and after this lay it down in the grass, giving it abundance of good clover and timothy seed. By this mode of cultivation the land will be rendered clean, and the produce will at least be doubled.

For the last four or five years I have threshed my grain with a threshing machine, which I purchased from Agricola. It cost me in the first instance a considerable sum, but I do not now regret the outlay, as it not only threshes cleaner than the flail, at least by 5 per cent, but the expense is now comparatively nothing. Where manual labor is so expensive, and difficult to be procured as in this Province, I am at a loss to conceive why these have not been more generally introduced.—Few farmers perhaps account their own individual tillage extensive enough to warrant the expenditure of the sum which a mill would cost, but could not six or seven unite and erect one for their common benefit? A dozen threshing mills, of effective force and approved construction, scattered throughout the settlements of Windsor, Falmouth and Newport, would thresh all the grain raised in them, and the saving which would accrue in two years would more than repay the first outlay.

Such, Mr. Editor, are a few hints derived from my one experience and observation, which I have amused a leisure hour in embodying in a plain and unostentatious manner, for the public eye. If they

will tend to enlighten the general practice, and to recal some part of the public attention to our agricultural improvement, my wishes and hopes will be amply gratified. I confess that I feel an enthusiastic desire to see the spirit which once animated the Province revived. It is at least a harmless and pardonable wish, and I must therefore beg an apology from your readers if I claim their attention, until I point out by what course this can best be obtained.

(To be continued.)

RAIL ROADS.

A correspondent of the Boston Daily Advertiser, gives the following as the advantages by which Rail Roads are distinguished above Canals.

The railway requires but one-third the quantity of land that is required for a canal, exclusive of ponds, reservoirs and feeders.

The railway requires one man and four horses to transport 31 tons four miles per hour.

The canal requires 2 men, 1 boy and 2 horses, to transport 30 tons 2 miles per hour.

The railway may be attended and kept in repair for one-tenth that of a canal.

Railways give the greatest possible facility to travellers. Canals retard them.

Railways may be easily passed in all places required. Canals only by bridges.

Railways interfere with no water privileges.—Canals destroy many.

Railways are subject to no interruptions, except from snow, which is easily removed.

Canals are subject to be interrupted by droughts, floods, frosts, leakages and locks.

Railways carry their freight to the doors of the warehouses.

Canals deliver their freight upon the wharf. A railway can be constructed for half the cost of a canal per mile.

A railway may be used twelve months in the year. A canal but seven months.

The toll of passengers will pay the interest on the cost of a railway.

The toll of passengers on a canal is very trifling.

Half the common rates of toll on a canal will be sufficient to pay the whole expense of transportation on a railway, including the toll.

Mountainous countries are easily surmounted by railways. Canals can never get over them.

Rivers and streams are much more easily passed by railways than they can be by canals.

Railways will be the pride of New England; they will unite them in one common centre, connect them in one common interest, and raise them to eminence and glory by one common operation.

[Prepared by the Editor.]

BEES.

FROM THE NORTH AMERICAN REVIEW.

(Concluded from page 142.)

A young bee can be readily distinguished from an old one, by the greenish colored down that covers it, and which it loses by the wear and tear of hard labor; and if the bee be not destroyed before the season is over, this down entirely disappears, and the ground work of the insect is seen, white or black. On a close examination, very few of these black or aged bees, will be seen at the opening of the spring, as not having the stamina of those that are younger, they perish from inability to encounter the vicissitudes of winter.

Our seasons are very variable. The scorching droughts of summer, deny to plants their accustomed moisture; no honey therefore can be made by the bees at such times, and they are compelled to eat of their winter food. They cluster about the hive, or deprived of their accustomed labor they are very restless, and often intrude into a neighboring hive, apparently for want of employment. In the summer of 1825, during the latter part of July, the heat was so distressing to the bees, the thermometer standing at 92° in the shade, that they seemed to have lost their usual instinct. A number of hives of the old fashioned patterns, that stood on a bench were well filled with bees. At two o'clock, for three days in succession, the whole swarm of each hive rushed out and ran into the adjoining hive, where they remained for a few seconds, without apparent offence to the invaded bees, who in their turn flew madly out and paid the same unceremonious visit to their neighbors. No quarrel ensued, nor a bee was killed by these impulsive movements. They seemed maddened by the heat; and yet the queen was left in the hive, for with all our attention to the sallying parties, we did not see a single queen among them. The same frenzy did not occur in those hives that were suspended upon joists, thus proving that the bees did not suffer so much from heat from those suspended hives, as they did in the flat-bottomed ones, that rested on a bench.

Our winters are equally disastrous to the poor bees. Of late years there have been so many mild days during the cold season, that a great deal of honey has been consumed. These alternations of torpor and animation cause greater exhaustion and loss of physical powers than could be occasioned by a continuance of uniform torpor. This we infer from the fact that in Russia, where the winters are uniformly cold, bees do not perish; and in the West Indies, where there is perpetual verdure, they are never exhausted.

But although a bee may remain torpid to a certain extent for six months in the year without injury, in those climates to which the insect has long been accustomed, yet it could not exist for the same space of time in lower latitudes, where such a period of continued cold rarely occurs.—Nature has not constructed them for every emergency. She has done no more for them in this particular than she has for man. They are compelled to get accustomed to a change of climate by degrees; not by an alteration of the structure of their organs, for that can never occur under any circumstances, but by some change that takes place in the circulation of the fluids of the body, by which the system is accommodated to a higher or lower temperature.

If we are correct in this opinion, the suggestion of Dr. Anderson would not be available in our climate. If, according to his proposal, bees were to be kept all winter in an ice-house, more causes than one would operate to the injury of their health, and consequently to the decrease of their number. The temperature of an ice-house, unless we are to suppose the hive to be buried in the ice itself, is much higher than that which is without the house. The torpor, therefore, would not be so complete as to put a stop to the digestive process. The bees would be compelled to eat; and as their food is constantly in contact with the impure, stagnant air of the ice-house, it would soon be vitiated and engender diseases.

We know of but two diseases to which bees are

subject in this country, and they have to our knowledge never occurred at any other season than the early part of the spring—dysentery and dyspepsia. The latter arises from the indolent inactive life, which they are compelled to lead, in our variable winters. The rule holds good with the most diminutive, as well as the greatest, in animal life, that, "if we eat and wish to preserve health, we must work."

During the last winter, (1828) the bees suffered more, and lost more of their number, than has often been known before. There was scarcely a day, that they did not sally out to search for employment and food; but not being properly stimulated, they seldom returned to the hive. We frequently saw them crawling on the ground, weak and spiritless; and those that did return soon perished. On examining the hives, we observed that nearly all the honey was consumed; and many of the brood, that in ordinary seasons, are not hatched until the first part of April, assumed the fly form at an earlier period and died.

The cure for this disorder the bees take into their own hands. As soon as the flowers appear, they go to work; and then it is that they resort for aperients and tonics, which they abstract from the floors of the piggeries.

The other disease proceeds from long confinement in bad air, and from unwholesome food, and is invariably fatal; nor can the bees avert it by any instinct of their own. We know of no cure for the dysentery, when the bee is seized with it. Those that have it badly must die. We can restore those that are least affected, by frequently washing the hives as far as we can reach, with weak lie, and by ventilating them and removing the dead bees.

Much has been said of the danger to be apprehended from placing an apiary too near our own dwelling. There is indeed no positive advantage in having it very near; but as the person usually engaged in hiving the bees is occupied with farming affairs, and is not always present when the bees swarm, it is proper that the apiary should be within sight of the family. A bee certainly has frequently attacked a horse, and we have once or twice heard of one being stung to death. Considering the great number of hives of bees, it is really wonderful that more accidents of this kind have not occurred. But they are exceedingly rare; and when we know how many hundred horses annually die from the disease called the *botts*, which proceeds from the maggots of the egg laid by the *horse bee* on the hair of the animal, the very few that suffer from the sting of the honey bee do not deserve to be taken into consideration. In every point of view, therefore, it appears that bees should be cultivated. The wax that is consumed in this country, in various ways is enormous, and most of it is imported. If we may credit Huish, Great Britain imports from Germany and Italy upwards of eighty thousand pounds sterling of wax annually. We are unable to say with any precision, to what amount it is imported by us; but judging from the quantity that each family uses in a year, and the amount employed in various arts, it must be worthy of notice.

It is really disgraceful to such a country as ours to import wax or honey. We ought ourselves to export tons of it every year; and we trust, that in a few years this improvement will take place.—Massachusetts and Connecticut are well situated, and abundantly supplied with proper food for bees,

and their climate being less variable, is better adapted to their nature. We spoke of hills of twenty feet in height; this only applies to the site of an apiary near a dwelling. The dwelling itself may be on a hill. We have heard of convents situated on mountains that have been well stocked with hives. In short nothing is wanting but good pasture, good hives, cleanliness, and attention to insure a rich reward to those who engage in the pursuit.

Children are naturally very fond of watching bees, and they would soon learn to take care of them, if they were not taught to fear them. All danger can be guarded against by making them wear woollen gloves that are long enough to draw over their sleeves at the wrist, and a wire cap to cover their head. They could thus be trained to manage bees; and training is quite as necessary to the full comprehension of the occupation, as it is in a trade of a carpenter or a shoe maker.

It would be unjust not to refer again to Mr. Butler's little book, after making it the occasion of expressing our own thoughts. We shall rejoice if our slender notice of his work should encourage him to put forth a new edition; and we shall now take leave of the subject, although it be almost in-exhaustible, by an anecdote, that we have reserved for the conclusion, that it may make the deeper impression.

A good old French bishop, in paying his annual visit to his elergy was very much afflicted by the representations they made of their extreme poverty, and which the appearance of their houses and families corroborated. Whilst he was deploring the state of things which had reduced them to this sad condition, he arrived at the house of a curate, who, living amongst a poorer set of parishioners than any he had yet visited, would, he feared, be in a still more woful plight than the others. Contrary, however, to his expectations, he found appearances very much improved. Every thing about the house wore the aspect of comfort and plenty. The good bishop was amazed. "How is this, my friend?" said he—"you are the first that I have met with a cheerful face and a plentiful board. Have you any income independent of your cure?"—"Yes, sir," said the clergyman, "I have; my family would starve on the pittance I receive from the poor people that I instruct.—Come with me into the garden, and I will show you the *stock* that yields me an excellent interest." On going into the garden, he showed the bishop a large range of bee-hives. "There is the bank from which I draw an annual dividend. It never stops payment." Ever after that memorable visit, when any of the clergy complained to the bishop of poverty, he would say to them, "keep bees, keep bees!" and we shall bid our readers adieu with the same advice.

HORTICULTURAL DISPLAY.

Last evening, a number of vegetable products, of great size and beauty were exhibited before the Horticultural Society; and some of them have today been placed in our office for inspection. We invite those who take interest in the works of nature, and particularly in the extraordinary manifestations of her power, to pay them a visit. The first is a set of mammoth cabbages. One of them, at a hasty glance, seems as if it had been designed to storm the fortress of Shumla. It is compact and firm, and weighs the respectable number of eighteen pounds. Another head approaches the

former in size, but lacks more in weight, from the want of equal hardness; and a third, very nearly the compass of the last, makes up a formidable triumvirate. The second, are a number of heads of Broccoli, a species of cabbage much resembling the cauliflower, of unusual dimensions. The third, are several heads of lettuce, grown from seed planted in August, and plucked yesterday. They are very handsome. These were all grown by Mr. William Wilson. From the same garden were also produced a splendid bouquet of roses and honey suckles, of delicious redolence. They were cut yesterday, off bushes and vines standing in the open air. This we believe to be rare, at the present season. The last of the catalogue, but not least, is a bunch of carrots, each root being about 16 inches in length, and 10 in circumference, at the large end! Doting philosophers in Europe may declaim forever about the degeneracy of our continent; but while we have such specimens of what an American soil and sun, with American cultivators, can effect, we stand in need of no wordy answer to their effusions.—*N. Y. Statesman.*

The secret of rendering docile, and handling with impunity the most venomous serpents, which has so long been in possession of the inhabitants of Western India, is not unknown in China. It is observed that snake-catchers here rub their hands, previously to taking hold of the snake, with an antidote composed of pounded herbs. The virtue of the preparation is such that they hold with the naked hand, and provoke, fearlessly, the deadly cobra-di-capello, or spectacle viper, which is, next to the rattlesnake of America, one of the most dangerous reptiles in existence.—*Canton Reg.*

Worcester coal.—This article is likely to prove more valuable than was anticipated. The Spy asserts that "Capt. Thomas has fitted up a stove for burning it in his bar room, where, for about a week past he has not used a particle of any other fuel, and has had as handsome and as good a fire as we ever witnessed of either the Lehigh or the Schuylkill coal."

TO CORRESPONDENTS.—We are obliged to defer this week a valuable communication on Fire Blight in Pear Trees, from a "NEW CORRESPONDENT"—and a notice of an insect in Fruit Trees.

Fall Seeds.

A small collection of seeds suitable for sowing in the autumn only, among which are the Lime Plant (*Podophyllum peltatum*) Snowberry (*Symphoricarpos racemosa*) Dwarf White Flowering Horse Chestnut, Pink Mezereum, Marigold and Superb Lily, &c. in papers of 12 cents each.—An account of the Lime Plant will be found in Fessenden's New American Gardener, pag. 123; we have but a small quantity of this seed.

New England Farmer Seed Store,
No. 20 North Market Street—Boston.

MUNROE & FRANCIS have just published the 21 edition of a work called *Seventy-Five Receipts for making Pastry, Cakes, and Sweets.* By a lady of Philadelphia. With a series of miscellaneous receipts for Dishes in use at Supper Parties; also, a complete list of weights and measures, whereby weight can be ascertained by measure.

MUNROE & FRANCIS have just published the 21 edition the House Servants' Directory, or a Monitor for Private Families; comprising hints on the arrangement and performance of Servant's Work, with general rules for setting out Tables and Sideboards in first order. The art of Waiting in all its branches; and likewise how to conduct Large and Small Parties with order; with general directions for placing on Table all kinds of Joints, Fish, Fowl, &c. &c. Nov. 23.

Wants a Situation

A young man lately from England, well acquainted with farming. Testimonials for sobriety, honesty and capability will be produced. Apply at this office. Nov. 23.

Subscription for Vine stock for the finest table Grapes
A. Parmentier, at the Horticultural Garden, Brooklyn, corner of the Jamaica and Flatbush road, two miles from New York, having been urged by several lovers of the vine to propose sets of the best kind for sale by subscription, offers to the public sets of a dozen vines, with good roots of the most select and choice grapes for the table; many of which are quite new in this country, and all of which will ripen perfectly in any situation either in town or country.

Names of the twelve Sorts.

1. White Chasselas, with large fruit
2. Chasselas of Fontainebleau, near Paris
3. Yellow Chasselas of Thomery, near Paris
4. Golden Chasselas, the real genuine
5. Musk Chasselas
6. Chasselas, with very large black fruit
7. Red Chasselas
8. White Muscat, or black Constantia
9. Red Muscat
10. Black Muscat, or black Constantia
11. Black Orleans, bears very well the frost
12. Black Gamet, yields a second crop of blossoms and fruit when the first are frozen

Nos. 11 and 12 are as fine for vineyards as for the table, the fruit is not so excellent as that of the preceding kinds, but is equally valuable on account of the certainty of a large crop annually.

The subscription receipt will be accompanied by directions on the best mode of cultivation, planting and pruning the vine.

The same sort of vines may be had separately, price One Dollar, except No. 4 Golden Chasselas, the genuine, which is Two Dollars. Communications for the above, and subscriptions to his establishment post paid punctually attended to.

References, Dr. David Hosack, President of the Horticultural Society, Dr. Pascalis, President of the Luncheon Society, Dr. McNeven, Dr. Mitchell, Dr. Stevenson, and Hon. John Lowell. Nov. 14.

Wine and Table Grapes.

A complete assortment of FRENCH VINE ROOTS in prime order, just received and for sale at a low price, by E. Copeland Jr. at the Dupont Powder Store, 65 Broad Street. **AMMUNITION** as usual. 31.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts. a paper. They were gathered by a gentleman familiarly acquainted with the sorts, expressly for us. They will be sold by the single paper, or packed to order, in any quantity. Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

The collection of LILIES is very splendid, comprising a great variety of colors.

HYACINTHS—(double and single) dark blue, porcelain blue, red and rosy coloured, pure white, white with yellow eye white with rosy eye, and yellow with various eyes; from 25 cts to \$1.00 each.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1.00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots, 23 cts. each.

JONQUILLES—sweet scented, finest roots, 14 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots, 33 cts. each.

DOUBLE NARCISSUS—fragrant, of all colors, 19 cts. each.

SPRING CROCIUS—of all colours, 6 cts. each, 50 cts. per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bulbs 1 inch and 3 1/2 inches in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the more refuse of the most inferior red onions, good roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for us.—For sale by the lb. or ounce.

New England Farmer Seed Store,

No. 22 North Market Street—Boston.

Bremen Geese.

JOHN PERRY has 6 pair of these celebrated Geese for sale, at his place in Sherburne. They can be delivered in Boston dried. 31 Nov. 24

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr. Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyard, and nurseries, in the districts of Bordelais, Clerac, and Buzet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1828.

Mr. A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1/2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1/2 cents for less than one 1000; and 15 cents for less than 50 roots. Payment to be made on delivery of the roots. Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 85 Wall street; Boston, E. Copeland, Jr.—Albany, R. M. Michael—Philadelphia, Van Amringe—Baltimore, Willard Rhoads—Washington City, Wm. Patto. Richmond, Davenport, Allen & Co. Savannah, Hall, Shapter & Tipper—New Orleans, Foster & Hutton—Charleston, (S. C.) J. & J. Street Co. Mr. A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal booksellers of the United States; and his agents will furnish them gratis to subscribers. (D12)

MISCELLANIES.

IMPROMPTU ON WASTE.

BY THE LATE EDWARD KNIGHT, ESQ.

Oh! waste not thou the smallest thing
Created by Divinity;
For grains of sands the mountains make,
And atoms infinity.

Waste thou not then the smallest time,
'Tis imbecile infirmity.
For well thou knows't, if aught thou knows't;
That seconds form eternity.

Advice.—A nobleman in Ayrshire, has the following very proper advice placed over his kitchen fire, in large letters: "*Neither waste nor want.*"

Sir Walter Scott has placed the same useful advice over the same place, in his kitchen at Abbotsford, but has adapted the more emphatic and classical words of Miss Edgeworth—"*Use not, want not.*"

One of the crew of the Macedonian, having received the wages of the late three years' cruise, went with the money in his hand, into a store, and having purchased a pocket book, put the roll of notes in his waist-coat pocket, and the book into that of his round jacket. The store keeper told him that it was the fashion to put the money into the pocket book, but the sailor affirmed, he was up to the tricks of the landlubbers, and went off. The next day he returned to the store exclaiming, in great glee, "They've got it—give me another!" He had indeed lost his pocket book, but secured his notes.—*Aurora.*

Shut the door!—Now that cold weather is coming in good earnest, and the mountains begin to be white with snow, we beg leave to renew our hint to those who have doors, to keep them shut, to save fuel, and make themselves comfortable. It is no trifling matter, when wood is dear and money scarce, to warm all out doors. But if you are resolved on warming the country at large, the better way will be to take your doors from their hinges to prevent them from slamming by the rude north-easters, and lay them up safely till warm weather, when they may be needful as a barrier against beetles, flies, and mosquitoes. But if you would keep the frost without and comfort within, recollect this homely but useful maxim:—

The hindmost shut the door;

But, behind or before,

Be sure to shut the door.—*Berk. Amer.*

The honey bird.—The manner of finding honey is very singular, as related to us by one of our party who had accompanied a Hottentot in search of some. The Hottentot went to a place that he thought likely to contain the hives, and immediately whistled with a sort of call that the honey bird, or *indicator*, is accustomed to, when the little feathered attendant made its appearance, chirping loudly, and hovering about them. It then flew forward, still chirping and then watching to see if they followed. It tried twice to lead them across a *kloof*, flying back and again forward to entice them to follow; they however, not liking to go that way, and the Hottentot continuing to whistle the call, the bird at length flew back and led another way, still watching and chirping to them to follow him, which they now did, and very soon it hovered over a place in the rock, where, on

searching, they found a hive full of honey; the bird immediately perched in a bush over them, and waited patiently until they had the honey, when it flew down, and took possession of the nest, and eat what was left for it. The honey bird is larger than a sparrow, with brown feathers. The quantity of honey taken every year is immense, and its flavor is very delicious. The bees seldom or never sting if they are not hurt. The Hottentot is very particular in his manner of leaving the honey for the bird, as he says that it will then remember him, and lead him another time in preference to any other person. When the bird has eaten the honey, the young bees are carefully closed up with stones, to prevent the rascal (a kind of badger) from taking them out, and as there is always a quantity of flowers, the bees never want nourishment.—*Scenes in Caffer Land.*

Anti-tariff example.—We were highly gratified at the sight of several ladies in church on the last Sabbath whose wealth would entitle them to the most splendid productions of India, attired in dresses of domestic manufacture. Their neatness does honor to the character of the sex, and affords an example worthy of imitation. We are pleased to see so much of the anti-tariff spirit already prevailing in this part of the country, and would recommend it still more extensively.—*Albion Jour.*

Lithographic printing.—We have seen an excellent likeness of Doct. Holyoke, which was drawn on stone by two of our ingenious townsmen, and was surprised to learn that this was their first experiment. It gives us pleasure to add, that the citizens of this town have evinced a laudible promptitude to patronize this meritorious production.—*Salem Observer.*

It is a fact, that the agent of a manufactory to be established in Prussia, lately ordered machinery to be made at a New England manufactory, to the amount of \$100,000, preferring it to what he could obtain in England.

Prof. Hitchcock, of Amherst College, has obtained a globule of tin, from a specimen of ore, found in the town of Goshen. This is the first tin ore found in the United States.

The orange tree.—There is an orange tree in a garden at Versailles, which is well ascertained to be above four hundred years old, having been sown in the year 1420.

WEIGHT OF CATTLE.

The following is a statement of the weight of the cattle, weighed at the Washington (Pa.) Cattle Shows on the 16th. ult.—all, except Mr. Burman's Bull, the oxen, and Mr. Reed's three first Cows on the list, are of the improved Short Horned stock.

Kenrick Nurseries.

100 Choice varieties of Ornamental hardy trees and shrubs, just received from New York, and selected in June last.

This establishment situated but an hour's ride from Boston, contains a very extensive assortment of Apples, Pears, Plums, Peaches, Apricots, Quinces, Grape Vines, Mulberries, Currants, Raspberries, Strawberries, &c. and a general assortment of Ornamental trees, shrubs, &c.

Also, the following fruit and ornamental trees of extra sizes, viz. Flowering Horse Chestnuts, Mountain Ash, Weeping Willows, Ailanthus, Catalpas, Purple Acacia, Dutch Cork Elm (a new article) Butternuts and Silver Firs.

300 Isabella Grape Vines; and White Mulberry Trees by the thousand.

Written orders addressed to John or William Kenrick, and directed to the Newton post office, will be promptly attended to, or they may be left at Mr. Joseph Bridge's Grocery and Seed store, Court street, Boston, where lists of the above may be seen. Trees will be packed in mats for shipping, when ordered, and delivered in Boston free of charge. 31 Nov 21

Winter Keeping for Horses in the vicinity of Boston.

Where the most faithful care may be relied on, may be had on application to Major Samuel Jaques, Charlestown, or Mr. T. J. Niles, School Street, or to Mr. Russell, Publisher of the New England Farmer. An early application is desirable.

LINNÆAN BOTANIC GARDEN AND NURSERIES, near New York, William Prince, Proprietor.

The new Catalogues of this establishment are now in the press, and may soon be obtained from T. & J. Swords, New York, and of the other Agents. The collection of Fruit Trees has been nearly doubled since the last edition, and comprises all the choicest varieties of every country. The assortments of Ornamental Trees, Flowering Shrubs and Plants, Greenhouse Plants, &c. have also been greatly extended, and in fact every department has received the utmost attention both to their extension and improvement. The grounds occupied by the establishment have been extended to 40 acres, and the proprietor can now justly state that orders for every description of Trees and Plants will be executed in a manner superior to all former periods. The Cherries, Peaches and most other Trees are of large size—many of the Peaches, Apricots and Nectarines are on Plum stocks. The collection of Grapes consists of above 20,000 ready for sale, comprising all the choicest varieties, and will be shipped in quantities at reduced rates, and 100,000 more are expected shortly from France and Germany. Without incurring invidious comparisons, the proprietor appeals to those acquainted with his establishment as to its decided superiority in every department. The whole management and supervision is attended by himself and sons, and orders received from any distance receive the same pointed attention as if the persons were on the spot to make their selections. The trees are packed in the best possible manner to ensure success, and with the greatest despatch, and are shipped to any place designated. And to those interested in Horticultural pursuits, he has only to say, that the same unremitted attention will be paid to the execution of his business, which has hitherto characterised the establishment. N. B. Plants of Wilmot's Superb Strawberry, and the celebrated Greville Rose can be supplied. nov 14—8

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be published to-morrow, the *New England Farmer's Almanack* for 1829. By Thomas G. Fessenden, Editor of the New England Farmer. For sale, wholesale and retail, at the N. E. Farmer office, No. 52 North Market street, by Bowles & Dearborn, 50 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office.

Pear Trees and Grape Vines.

For sale at the house of Samuel Downer, in Dorchester, 200 Pear Trees of the choicest varieties. 100 Isabella and Bland's Virginia—200 native and 200 Sweet Water Grape Vines from 2 to 3 years old. Also, a variety of Rose Bushes, Ornamental trees, white lilies, &c. Apply to Rufus Howe on the premises. Dorchester Nov. 21. 31.

HORTICULTURE.

FOR THE NEW ENGLAND FARMER.

DISEASE IN FRUIT TREES.

MR. EDITOR,—I regularly look into your weekly paper with a view to get any passing information that may be current in regard to fruit trees, as I have a few in my garden of different species which I have become fond of, because I have raised them up from infancy—a desire to keep them in health, has induced me occasionally to look over the communications which have been made to the public in former, as well as in the present days. Through your papers I have frequently received useful information; but not being acquainted with the physiology of plants, I am obliged to resort to such authors as are, and in the course of my researches I have fallen on some volumes of the olden time, that are still, I believe, considered in Europe as standard works. It is true, I have been told by the conductor of a great Horticultural Establishment, that the Europeans knew nothing about fruits or fruit trees, and that all correct knowledge on the subject is to be found here in this country; at least that the English and French are totally ignorant, and as I can read no other languages among the Europeans than these, I am of course obliged to depend on the experience of those in this country, whose science and extensive cultivation enable them to instruct the novice in his duties. But I find such a diversity of opinions as to the modes of planting, pruning, manuring, and general management of trees, that I am at a loss to know whom to follow—and as my former dependence on the English and French cultivators has been set at naught by a distinguished, and very celebrated horticulturist of our own country, like a ship without a rudder, or a bird without a tail, I am unable to pursue any consistent course.

I want to see some writer come forward who will give us a regular treatise upon the propagation and raising of trees in nurseries—with the manner of treating them until they are in a state to be transplanted to the places in the garden or orchard where they are to remain, and produce their fruit—upon their treatment there—a description of the soil suited to each kind of fruit—the manner of preparing such soil to receive the trees—its depth for the different species—the depth at which different trees should be planted—the mode of pruning while young, and again when in full bearing—the kind of manure, if any, suited to each species of fruit, and the best mode of treating the various diseases to which each species, or the varieties of each species are subject. To this I should like to see added a list of all fruits by their proper names—their time of maturity, and the time proper to gather and preserve them. I am aware that there are many treatises before the public, that treat of these subjects in part, but they are imperfect and mostly compilations from English or French authors, by whom, in general, little is said of the diseases of fruit trees; and if they had said more, I suppose they know as little of this subject as they do of fruits, and of the general culture of trees. Apropos—as

I am upon this subject of the diseases of trees, I will, with your leave, ask if Mr. J. BUEL, of Albany, who has published an article on "fire blight," in your last paper, [Nov. 21st] means to say that the disease commonly called fire blight is a new disease or unknown till of late years, and whether the disease which we see on the branches of the plum, and morello cherry is also of recent date? From his communication I should judge that he had never heard of them until lately—and that a few set of insects had arisen in our country to effect all this intolerable evil. But if I am not mistaken, I have read in some works published in Europe, some eighty or ninety years ago, a minute description of both these diseases, and by men who were, and are still supposed to possess as perfect a knowledge of these subjects, as any that had gone before them, or have written on the subject since, up to the time of Mr. BUEL. This gentleman says he perseveres in cutting off and burning the diseased branches, and has thereby overcome the evil. I apprehend that any one who will persevere in this course will be equally successful; it is an old practice recommended by the writers I have alluded to, and I have no doubt is a good one.

But there is another part of Mr. BUEL's theory, which I have less confidence in—that is, that the evil is produced by insects. There is no doubt that insects are found in these tumors, because the eggs are there deposited when the extravasated sap is in its tender and albugineous state. But as this evil does not arise in some soils, and where the trees are protected; in particular, light sandy soils, not too much manured; and does invariably in the richer and more highly manured spots, I should pause before I adopt Mr. BUEL's theory. But, as this gentleman says, "it ill becomes me, after objecting to other theories to set up one of my own, without ample proof to support it; but as my only object is to incite investigation, and elicit truth, I hope I shall be pardoned for my presumption in suggesting it, unsupported by anything but casual observation and reflection."

My theory is, like Mr. BUEL's, an old one: both existing, I believe, many years before either of us were born. Different species of trees, and different varieties of each species require for their well being, different qualities or descriptions of soil, and different modes of culture. Some trees, like the apple, the pear, and the peach, require a good depth of soil. Others, like the cherry, and the plum, are content and thrive as well, if not better, in a soil of less depth. Some fruits, like the Brown Beurré, St. Germain, Virgouleuse and Colmar, require a rich soil; while the St. Michael, the Moorfool Egg, the Culotte Suisse, the Chaise Madame, &c. do better in a light gravelly soil. Some fruits require the shelter of the town, others do better in the open country; some do best trained on trellises with a south aspect, others of the same species are ruined by this exposure; some delight in a wall and are all the better for it, while others are rendered insipid and worthless by this sort of forcing. In my little way, for I have not, like Mr. BUEL, thousands of plum and cherry trees to contend with, I have invariably found that where my plum trees have been planted in a light, shallow soil they have not been subject to

the disease in question, and where they were planted in rich, deep and moist soils they have been covered with the disease. Like Mr. BUEL, I have been accustomed to cut out the disease, or cut off the limb, as the case might require; but in such soils I have found it return until I have become disgusted with the trees, and taken them up.

In our town of Salem, and our neighboring town of Beverly, plums, the best of plums, (the Green Gage,) succeeds perfectly. Whenever they are cultivated in a suitable soil, they produce the greatest abundance of good fruit, and our trees are seldom disfigured with the disease alluded to: while in the neighborhood of Boston scarcely a plum tree can be seen in good estate. I ought, perhaps, to except the plains of Cambridge and its neighborhood; Charlestown hills, and some parts of Dorchester and Roxbury, where plums are easily raised in perfection. But a suitable climate, combined with a suitable soil, after all, make healthy trees, and healthy, fine, and delicious fruit. In such situations, but little care from the cultivator is necessary: the topping of a few branches, that may interfere, or that may have run themselves out by overbearing, is all that may be required, until the trees need renovating by having fresh virgin earth applied to their roots. In the same garden, some plum trees will be covered with this species of leprosy, while others at a distance from them and in a different soil will be free from corruption.

A NEW CORRESPONDENT.

November 27th, 1828.

[By the Editor.]

A Methodical Treatise on the Cultivation of the Mulberry Tree, on the Raising of Silk Worms, and on Winding the Silk from the Cocoons. United to an accurate description of the Winding Mill. With Plates. Abridged from the French of M. De la Broussé: with Notes and an Appendix. By W. H. VERNON, of Rhode Island.

A work with the above title has lately been published by Hilliard, Gray & Co. Boston, containing useful information on a subject, which has lately been much canvassed, and elicited the intellectual efforts of many of the first minds in the country. We should be happy to give our readers an intelligible and useful sketch of the contents of this book; but it is not possible to abridge, to any useful purpose, details of processes of the kind necessary for the manufacture of silk, or indeed for the production of any other work of art, requiring skill as well as labor. One might as well attempt to curtail the steps of a ladder without injury to the implement, or destroying the facilities it presents for ascending a given height. We shall therefore merely give such quotations from the work as shall show its objects, and enable our readers to form some estimation of its value.

The first part comprises a well digested treatise on the cultivation of the mulberry tree, in which the original author enters into a variety of practical details on its production and treatment. But the utility of his precepts is not confined to that particular species of tree. They are most of them equally applicable to nearly all the different kinds of fruit trees:—and our enlightened cultivators

would derive much merit from the adoption of a similar system of management of their orchards. His prescriptions on sowing, planting, watering, tilling, grafting, and pruning, are all of them excellent; and, though not wholly unknown here, are generally misused or neglected by our farmers. The rules which he enforces are the result of long observation and successful practice, and prove that in agriculture, as well as in every other art, profit can be derived only from labor and science.

In the second part, the author treats scientifically of the silk worm, from its birth to the chrysalis; of the supply and of the preservation of the seed for the next year's brood; and of that essential point in the production of good silk, the winding of the fibres from the cocoons.

For the more perfect illustration of this work, and to make it more worthy of public acceptance, four plates, with the necessary letters of reference have been engraved by a skilful artist.

VARIETIES OF THE MULBERRY TREE.

There are two species of mulberry trees;—the white and the black. The white mulberry puts forth light green leaves, smaller and thinner than those of the black mulberry. They are besides longer than they are broad, and the green of the underside of the leaf differs from that of the upper side, only by being less glossy. The leaves of the black mulberry are wider than they are long; they are thick and covered underneath with a sort of white down. The white mulberry gives shoots thicker and shorter, and it vegetates more slowly. The barks as well as the fruits of the two sorts of trees are very different. The white mulberry has a yellow bark, and its fruit is white and insipid; but the black is clothed with a bark of a much darker hue, and gives excellent mulberries, which we eat with pleasure, and which are regarded as a salutary fruit.

There are four kinds of the white mulberry;—the wild mulberry, the grafted mulberry, the rose mulberry, and the Spanish mulberry. The wild mulberry is generally produced from the seed of the grafted mulberry: its leaves are small, thin, indented, and of a deep yellowish green. The grafted mulberry tree produces a beautiful, well spread leaf, and of peculiar excellence for silk worms in the last stages of their growth. The rose colored mulberry is nearly as good, but its leaves are thinner and of a more beautiful green than those of the ingrafted mulberry. The Spanish mulberry gives a wide, thick leaf, full of juice, and bears a grey colored fruit much larger than that which is known here by the name of the grafted mulberry. Under the denominations then of black and white mulberry, we find five sorts: four of which, the wild, the grafted, the rose, and the Spanish, belong to the white species; and the black stands alone. The leaves of all these may serve for the nourishment of the silk worm; but it is not a matter of indifference to make use of the one or the other sort. On the contrary the success of raising silk worms, the quantity of silk which they give, as well as its intrinsic beauty depend much on the choice of their food.

The black mulberry is the least advantageous for silk worms, because it produces a coarse silk, and for that reason it is not used as a food for them. The Spanish mulberry would have the same effect if the silk worms were nourished a long time with its thick fat leaf. But those who are skilled in the care of silk worms do not touch its leaf before the moment of the greatest con-

sumption, and at the time when they need to be filled with substantial nourishment.

The leaf of the wild mulberry being very small and very thin, it nourishes little when it is gathered upon meagre or sandy land. It would be necessary to have a large plantation of this sort of tree in order to secure a good income to the cultivator; but if these mulberry trees were planted in a rich soil the result would be different.* We lose our silk worms, in the low Languedoc, only through the want of this sort of wild mulberry upon our good lands; although it be absolutely necessary to have grafted mulberry trees upon our bad lands. That neglect, and the great heats which we sometimes experience in the month of May, both in Provence and Languedoc, are the two causes of the failure of the crops of silk, which are otherwise so lucrative.

The leaf of the grafted white mulberry is preferable to all others for the nourishment of silk worms. Its leaf is more tender, and the worms eat it more greedily. This early mulberry puts forth its leaves fifteen days sooner than the black and the Spanish mulberry. It grows faster—adopts itself to all sorts of soils, and its leaves augment the quantity, and improve the quality of the silk.

Every thing is useful in the mulberry tree. Its first leaves are valuable in the silk which they produce, by nourishing the silk worms—its second leaves fatten our cattle—its fruit is excellent for poultry and sheep, and the wood is useful for joiners, and makes good fuel. The mulberry tree may also serve as an ornament for our gardens. Very different from the hornbeam, which never attains a good height; from the elm, which is often devoured by caterpillars; from the ash, which makes no shade, the mulberry tree joins to its pecuniary benefits every other advantage that you may desire. It makes a refreshing shade—it covers itself with a magnificent foliage—it grows to the height that you may wish—it takes any form that you please to give it, and as this tree is always handsome and useful, the Author of nature has been pleased to add cleanness, for we rarely if ever see upon it caterpillars, lizards, spiders or any other sort of vermin.

(To be continued.)

AGRICULTURE IN NOVA SCOTIA.

(Concluded from page 149.)

To the Press of the Province I think some blame may justly be attached. Agriculture is a subject which to the Conductors of our public journals seems to possess no interest? for with the exception of some articles in your own excellent miscellany, I scarce recollect of a column within the last twelve months, devoted to the instruction of the farmer. Now although these journals are published in the metropolis, and the community in which you move is chiefly conversant with commercial subjects, still you ought to bear in mind that a large, perhaps the greater portion, of your

* The proprietors of the soil in the former provinces of Southern France, which before the modern division into departments were so well known by the names of Provence and Languedoc, cultivate the white mulberry as an object of revenue. None of the rich, and perhaps few of the middling classes of land-holders undertake to raise silk worms. This care is generally confined to the small proprietors and to the peasantry, whose agricultural labors are generally bestowed on articles of subsistence; and they purchase the mulberry leaves of those land-holders, who can conveniently appropriate a part of their estates to the cultivation of the white mulberry. From the leaves of this tree, which sell from five to six livres the quintal, they derive a good income.

readers are occupied in the labors of the plough, and derive their subsistence from the cultivation of the soil. For the advantage or improvement of these a part of your journals ought weekly and regularly to be devoted; and as so many agricultural and periodical reviews are published both in America and the mother country, containing all the modern discoveries connected with the science, I do not think it would impose a duty of any great hardship to select from these such articles as are appropriate to our situation and circumstances. These would naturally form the subject of conversation and discussion among our farmers, new light would be struck out to enlighten their practice, and the march of improvement would go on at a more steady and rapid pace.

In the measures which tend to the improvement of agriculture, I place the formation of good roads in the first rank. From the unprecedented zeal which our late Governor, Sir James Kempt, directed to this branch of the public service, vast advantages have already been derived; and to myself individually, as well as to many thousands in the Province, it must be a subject of the most sincere regret, that His Excellency has been called from us ere the many improvements which he had projected, both on the Eastern and Western Post Roads, were completed. The good already achieved, although of such incalculable utility, I have ever regarded as the precursor only of what was to follow; and although His Excellency had already accomplished so much, for the fame of his administration, he had still marked out for himself a wide field of enterprise, from which to gather a richer chaplet of civic laurels. By improving the internal communication the market is rendered of easier access to the farmer, and the expense of the carriage is reduced. The cost of production is thus lessened, and he can afford to sell the article at a more moderate price to the consumer. Public improvements minister thus to the advantage of the whole community; and there is no doctrine in the whole range of political science more clear than this—that those improvements which tend to benefit the farmer, to increase the facilities of production, and lessen the price of the necessities of life, come to affect and to benefit every other branch of the national industry. In addition to the plans already pursued, the ratio of our agricultural advancement would be largely increased, were the Legislature to appropriate a part of the public funds for the opening of new roads through the wilderness lands.—The facilities of settlement would thus be multiplied, and the cultivation of the country and the population would spread in equal proportions.—This system has been frequently followed by the State Legislatures of the neighboring Republic, and I have read of many instances where it has been attended with the most flattering and animating success.

I have no wish, Mr Editor, to rush headlong into literary warfare, or to run a tilt with existing prejudices; but in a new country like this, when we pursue any scheme, in which other countries have attained an acknowledged superiority, it is surely the work of wisdom to review the steps of their progress, and to guide our efforts by the lights which their experience has set up on the way. Now, Sir, whether we turn to the finer farming Districts in Europe or in America, we will find, that none of these have reached any very

honorable distinction, until Agricultural Societies have been founded and patronized by the wealthy and enterprising, and intelligent; and indeed it seems a fact established in the history of this science, that an active spirit of improvement has ever been contemporaneous with the rise of such an institution. In France, in the Netherlands, in England, Scotland, Ireland and throughout the United States of America, agricultural associations have been everywhere founded, and all the more eminent authors on Rural Economy—Arthur Young, Sir John Sinclair, Dickson, Cully and Coke, unite in one panegyric in their favor. It is a mistaken notion that the practice of Agriculture is so easy and simple as to be followed with success by the ignorant. The unlettered boor, who follows the track of the plough, is no more capable of comprehending the principles of vegetation than the illiterate mechanic, who polishes the brass for the Orrery, can compass the beautiful and mysterious harmony of the solar system. True, he does know that the sun appears in the East and sets in the West, as the ploughman perceives that the seed confined to the faithful bosom of the earth, springs up a graceful and stately plant; these are things visible to the senses; but both are equally incapable of penetrating into those natural causes, which produce effects of such mystery and power. To be a successful practical Agriculturist, to understand the chemical properties of soils, to know the proper ingredients and the fittest manures to apply to each, so as to bring their vegetative powers into the highest perfection; to be acquainted with the diseases of plants, to be capable of mitigating and counteracting the effects of an unpropitious season; are points of information, which, to investigate and master, require a mind of no ordinary stamp. Many of the most valuable discoveries in agriculture have been made, not by the practical followers of the Art, but by men who have pursued the science as one of philosophical research. One of the most striking advantages, conferred by Agricultural Societies, is, that it brings such men to take an interest in the subject, and induces them to unite with the wealthy and respectable in dignifying the labors of the husbandman. They concentrate into one focus, and direct to one end, all the intelligence of a district. They elevate and improve the agricultural mind, and turn it to more enlightened and scientific inquiries. They bring the farming classes together to explain and to discuss new modes of practice and detail each others' experiments; and while they necessarily impart a new charm to the operations of the field, they sharpen the general intellect, and render the improvements and experience of each, the common property of all. The good effects which *did* result from them in this province, whilst they were in existence, were surely sufficiently seducing to recommend them for the future; and I am fully satisfied, that, if the Legislature wish to see this Province independent of all foreign supplies, they must again bring up some general system of agricultural encouragement, similar to the one before in operation. Under the guidance of experience new checks may be provided, and modifications may be introduced, to meet the circumstances, or rather the prejudices of the country; but if our legislature wish to raise our agriculture into a prosperous and enviable condition, if they are disposed to follow the example of older and more enlightened states, if, in short, they wish the breath of a long life to be infused

into all the labors of the husbandman, their counsel and patronage must be lent to these institutions.

In looking, Sir, at the sources of native wealth, can I see why the friends of our commerce and fisheries should feel any jealousy in seeing a portion of the public funds diverted to so useful and so important an object. What country, in the history of the world, ever became opulent or powerful, without an industrious and respectable peasantry? True, we can fall upon one or two examples in history where states have enjoyed a brief and passing splendour from the returns of an active commerce, *but national wealth and national greatness have never been permanent and stable, when they were not created and supported by the riches of the soil.* I wish not to put forward any elaborate display of facts in support of the position, for I regard it in the History of National Wealth a point as strongly confirmed as a political axiom can be. Is it not acknowledged by all writers on economy that the domestic demand is infinitely more profitable to the trade of a country, than the foreign or distant demand. The commerce of a country is a machine made up of distinct parts, all of which are dependent on each other. Of what use would be those immense importations of British goods, which are thrown into Halifax every spring and fall, were there not a numerous agricultural class to consume them; and in how large a ratio would our West India trade be curtailed were the demand for its produce confined to Halifax, and the fishermen situated on our Atlantic shore. I frankly admit, on the other hand, that the demand for agricultural produce among the inhabitants of the town and the seaboard, is of essential consequence to the farmer; but surely it is the height of folly for the friends of trade to imagine, that they can advance and build up their own interests by pursuing any set of measures which will be prejudicial to the prosperity of our inland districts. A nation is a family upon a large scale; quarrels distract, contentions ruin it. The prophetic language of scripture is admirably consonant with the influences and issues of human events. It is a deceiving and melancholy folly for the followers of one branch of industry to claim a superiority over those of another; the prosperity of one inevitably even though imperceptibly, ministers to that of the rest, and the happiness of a people, compounded of different classes, springs only from the prosperous condition of all. Agriculture, commerce, and fisheries, in Nova Scotia, like the three emblems which adorn our national banners should be "*Tria juncta in uno*," and from the motto which the Highland Chieftain bears on his shield, "together all, and single nothing," they may derive an imposing, instructive lesson.

But although so much may be effected through the agency of agricultural societies, provided they be supported by public funds, still there can be no doubt that the march of the Province would be vastly accelerated, were the internal consumption increased in any rate; for, as Mr. Huskisson has energetically said, the "power of consumption" is at once the index and source of a nation's prosperity. This could be promoted by the introduction of coarse manufactures, a branch of industry for which the country is perfectly prepared; and which, in its beginnings, only requires the attention and encouragement of the Legislature. From the improvement, which has lately been made in

the breed of sheep throughout the Province, there is an index afforded of what might be accomplished. Wool of excellent quality could be produced here in great abundance, and were capital directed to the manufacture of it into coarse flannels, cloths, &c. it would not only yield a fair return for its employment, in agriculture, but would largely swell an internal demand for agricultural productions.

The subject matter of this letter has multiplied on my hands. I intended, when I sat down, to confine myself to a brief illustration of the table above inserted; but every thing which relates to agriculture has with me so great a charm, and the anxiety I feel to see its practice improved in this Province is of so enthusiastic a character, that I have been led more at large into the subject than I at first meant. I trust my notions are sufficiently reputable to excuse the liberty I have taken with your readers; and that the length of this letter will be no argument against its worth.

THOMAS KING.

[By the Editor.]

SALIVATION IN HORSES.

It is said that if parsley seeds are sown with clover seeds the hay or grass produced by the mixture will cure Slavers, or Salivation in horses, a troublesome complaint in which water runs profusely from the mouths of the animals.

BOTTS IN HORSES.

A writer for the American Farmer vol. V. page 214, who signs "*Nimrod Owings*" says, "to prevent botts, burn hickory wood into ashes and keep on hand for use, giving once a week about a pint to each horse in his food; if oats, wet and sprinkle the oats; the horse will eat them without objection, and I think it, perhaps the means of keeping horses in health, where they would without the ashes have been diseased from other causes." Probably the ashes of other wood as well as that of hickory might preserve the health of the horse.

ON THE PRESERVATION OF CABBAGE.

If the raising of vegetables is an object to the farmer, their preservation will be found no less so. I am convinced from a partial experiment that the following mode of keeping cabbages will be found useful. After they are gathered, and freed from their loose leaves and stalks, that nothing remains but the sound part of the head, head them up in a tight cask. By thus excluding them from the air they may be kept a long time. Those intended for the longest keeping should be put into small casks, as they will soon spoil when exposed to the air.

TO PREVENT BEER FROM GROWING FLAT.

Put into a cask containing eighteen gallons, a pint of ground malt, suspended in a bag, and close the bung perfectly; the beer will be improving during the whole time of drawing it for use.

FINE CALF.

Mr. Moses Field of Northfield, Mass. lately killed a Heifer Calf, only 6 months and one week old, which weighed as follows:

Quarters, 263 lbs.

Hide & Tallow, 51 do.

The mother of this calf was two years old, only; and the calf ran with its dam till killed, and neither had any food but what was derived from a good clover pasture.—*Communicated*

FOR THE NEW ENGLAND FARMER.

CONTRIBUTIONS TO ENTOMOLOGY.

No. V.

Family Dytiscidae.

In order to distinguish our friends from our enemies, insects decidedly injurious from those that are beneficial to mankind, we must study the history of all which may be observed, whether inhabitants of the air, the earth, or the water. The insects of this family pass the first and last stages of their existence in lakes, ponds and pools. They are among those that make reparation for the injuries they commit in some respects, by keeping within bounds other annoying insects. In the larva and perfect states they are predaceous, sanguinary, and carnivorous. Their food is aquatic animals, such as the young fry of fish, tadpoles, some of the mollusca, crustacea, and worms, and the larvæ of dragon-flies, gnats, and mosquitoes; and in their turn they serve as nourishment to fishes, &c. The larvæ live in the water only, the pupæ are terrestrial, and the perfect insects amphibious. I have repeatedly found the latter remote from water, where they had transported themselves by flight. It is at night that they usually ascend into the air, to exercise their ample wings, or to seek for a better supply of food in more distant waters. They sometimes enter our windows in the evening, being attracted by the lights. The perfect insect swims with celerity by means of its feet, particularly the hind ones which are flattened and densely fringed with hairs; it rises from the bottom without effort in consequence of being rather lighter than the water.

The respiration of these insects is worth examination. In terrestrial animals of the higher classes air is inhaled through the throat into the lungs, where it produces an essential and vital change upon the blood. In fishes the same effect is produced by the water, which always contains a large proportion of air mixed with it, and which, entering by the mouth, passes out again at the gills, a kind of lungs. Other aquatic animals have these gills, or branchiæ as they are called, outside of the body, and hence constantly bathed in water, and exposed to the action of the air that it contains. Some aquatic larvæ of insects have similar respiratory branchiæ, and these are the only ones to which pure or unmixed air is not necessary. The majority of insects, in all stages, breathe air through lateral pores or spiracles, not receive it through the mouth, and the lungs are replaced by longitudinal tubes, their numerous minute branches, and air vesicles. The spiracles of insects, which open directly into the longitudinal tubes, are from two to eighteen in number: through the posterior or anal and abdominal ones the air is admitted or inspired, and it is expelled or expired through the anterior ones or those of the trunk. The *Dytiscæ*, in the perfect state, have eighteen spiracles, the abdominal pairs are situated upon the dorsum, and are covered by the elytra. When it becomes necessary for the insect to take breath it ascends to the surface of the water, reversed, the under side of the tail being uppermost, and the body kept steady by means of the long oar-like hind legs, which are extended at a right angle with the trunk. The abdomen is then slightly curved so as to separate it from the elytra, and elevate it above the water, the air easily insinuates itself into the cavity thus formed, and is inhaled at the pores, the last pairs of which are

larger than the rest to admit it in this position with greater freedom. When inspiration is completed the elytra are quickly closed upon the body, and the entrance of water effectually prevented. This motion is sometimes so sudden as to retain, between the body and elytra, a small quantity of unimbibed air, which makes its way under the tips of the latter, where, as the insect sinks, it adheres, a transparent globule, brilliant as quicksilver. The upper surface of the body being arched or convex, and its under side braced by a breast-bone of several pieces firmly interlocked; it is rendered sufficiently strong and inflexible; while its oblong oval form and thin margins are well adapted for its rapid and varied motions.

Although insects have no organs of voice most of them emit various sounds; and those of this family, in common with many others, exhibit their distress on being handled by a creaking sound produced by the friction of the tail against the elytra.

They pass the winter in the perfect state, burrowing in the banks and mud of their pools.

One has been kept for three years and a half in perfect health, in a glass vessel filled with water, and supported by morsels of raw meat. It was capable of fasting a month; was very sensible of the changes of the weather, which it indicated by the height at which it remained in the vessel.

DeGeer fed one upon flies and spiders, and, after it had lived a long time, he gave it a large leech which it attacked and devoured; but it paid dear for its gluttony; the food proving indigestible was thrown up the next day with great efforts, and shortly afterwards the insect died.

GENUS DYTISCUS.

D. **fraterculus*. Punctured; beneath black; thorax with a yellowish band and margin; coleoptra arcuato-fasciate behind; elytra of the female sulcated.

Length about eleven twentieths, breadth between six and seven twentieths of an inch.

Body depressed, with numerous somewhat dilated punctures. Head pale rufous, black at base, with two lunated piceous spots between the eyes. Thorax with an ochreous yellow margin, and transverse band, which is dilated backwards at the sides, and separated from the posterior margin by an obsolete blackish line. Scutellum impunctured, black. Coleoptra blackish from numerous confluent, black spots and flexuous lines; epipleura, external margin, subsutural line, common arcuated band behind the middle, and obsolete macula at tip pale ochreous yellow. (Male with four obsolete elevated lines on each elytron.) Prosternum and anterior legs pale ochreous; hind legs piceous, thighs black. Ventral segments with a pale piceous submargin, and, on each side, a yellowish spot.

Female. Coleoptra with eight, dilated, hairy grooves: (not including the external, depressed submargin which is not, properly, a groove;) tarsus depressed. The external groove commences at about one quarter of the length of the elytron from the base, the next to it is considerably longer, the third from the margin is shorter than the second, but longer than the first, and the submarginal groove is shortest of all.

I have not the least doubt that this is the female of the above male, which most closely resembles D. *mediatus* of Mr. Say. In the latter, of which I have seen the sexes, the body is rather less obse-

in front, and the elytra of the female are not sulcated, but plain like those of the male; and probably belongs to *HYDATICUS* of Leach.

The *fraterculus* is entirely distinct from the *sulcatus* of Europe, and with it, belongs to the subgenus *ACILLUS* of Leach. It is described from nine specimens of the male, and six of the female.

D. **fascicollis*. Convex, impunctured, pale testaceous; vertical lunule and base of the head, anterior and posterior thoracic fasciæ black; elytra blackish, irrorate with distinct pale yellow dots, the external margin and an abbreviated subsutural line yellowish; a distinct dorsal series, and three others obsolete of impressed setiferous punctures. Thorax of the female obsoletely corrugated each side; elytra smooth.

Length eleven twentieths, breadth over six twentieths of an inch.

Variety. Body beneath and feet pale piceous.

Specimens seven. Is probably referrible to *HYDATICUS*.

D. **thoracicus*. Pale rufo-testaceous, impunctured, oval, and somewhat convex; head and thorax immaculate; external margin of the elytra pale testaceous, disc blackish with confluent, black tortuous lines; three dorsal series of punctures. Female with obsolete rugæ on sides of the thorax; elytra smooth.

Length nine twentieths, breadth nearly three tenths of an inch.

Specimens seven. Appears to belong to *HYDATICUS*.

VEGETABLE ARTICLES OF VALUE FROM DENMARK.

Communicated for the New York Farmer, by Dr Samuel L. Mitchell.

The distinguished savant Hoffman Bang, in a letter I very lately received from him, dated at his residence in Hoffman's Grove, writes thus: "I owe you many obligations for the Memoirs, &c. which you sent me by Mr Wheaton. It would be exceedingly agreeable to me that I could be useful to you in some way. I accordingly send you a collection of minerals from Norway; three tracts on gardening; seeds of different sorts of garden plants, pot-herbs, and flowering vegetables, which, I hope, may thrive in your American soil. I will endeavor to forward you another collection in season for planting in the spring of 1829. I earnestly request your Horticultural Society will send me something of the like kind in exchange. I could despatch them the best sorts of fruit trees that we cultivate here. Supposing that a collection of the Algae, arranged upon the system of Mr Lyngbye, might be agreeable to you, I pack up the accompanying collection of these rare productions of the sea."

Among these articles are nine varieties of peas, viz. the green branched pea; the English pea called Maiklut; green pea of France; early pea of Flanders; another early pea called the May-dolber; Dutch early pea; another early pea named horn-harred, highly esteemed in the market of Copenhagen; another Dutch pea, and the Dorman pea.

Ten sorts of melon seeds.

Ten varieties of pumpkin seeds.

Twelve kinds of ornamental flowers.

And a parcel of the *Tetragonia Expansa*, or New Zealand Spinage.

The cryptogamic individuals of the marine herbarium of Mr Bang, consist of one hundred and

seventy species, all in fine preservation, and classed, named and labelled according to the most modern improvements. Among the articles received, are a number from the shores of Denmark, Norway and Finland; but a large part of the collection is marked as belonging to this magnificent gentleman's own estate of Hoffman's Grove. It is curious to observe with what laborious skill and phytological industry, Mr Lyngbye has classified these minute and difficult objects. Among them is the genus *Bangia*, named after the illustrious donor, and the *Oscillatoria* which attaches the loose particles of submarine soil together, and forms a coherent body underneath. The able author has written a particular dissertation upon an important species of this vegetable, eminently operative in fastening a sandy bottom in such a manner as to render it adhesive and firm.

The mineralogical articles consist of about thirty species, chiefly from the memorable region of Arendal, which bear a remarkable resemblance in their exhibition of original rocks, to the primitive formation of New-York city and its vicinity.—These, like the other specimens, are accompanied by a scientific catalogue, allowing comparative examination.

QUALITIES OF TIMBER, AND VIGOR, MATURITY AND DECAY OF TREES.

The qualities of wood depend much on the state of the tree when cut down. It appears, from the experiments of M. Hartig upon wood applied as fuel, that trees which have attained maturity, without passing into decay are the best for the production of heat. Thus, the value of an elm of 100 years is to that of one of 30 years as 12 is to 9; that of an ash of 100 years to one of 30 years as 15 to 11. When the trees begin to decay, their value rapidly diminishes. Thus, if an oak of 200 years yields wood worth 15 francs per cord, a tree of the same kind passing to decay yields wood only worth 12 francs. When the wood is used for other purposes, the advantages conferred by a mature and healthy state are still more considerable. The common elm growing in a forest, and in good earth, acquires its full increase in 150 years; but it will live many years, even 500 or 600 years. Large forest elms are cut down with advantage when of an age between 100 and 130 years, and then furnish a large quantity of building wood. The duration of the life of the elm depends much on the soil; in a dry soil it becomes aged, as it were, in 40, 50 or 60 years. Elms which have been lopped live for a shorter period than the others. Those that grow by the road side, or in thin plantations, may be cut when 70 or 80 years of age. In general, the increase of hard woods, as the oak and elm, is slow at first; it successively augments until the 20th or 25th year; is then uniform until the age of 60 or 80 years; after which it sensibly diminishes. For these and other reasons, it is important that trees should be cut down when they are in their mature state, and not simply when they undergo no further increase. When the period has arrived after which the increase of the tree would be less and less from year to year, then the tree should be felled, for no advantage accrues from its remaining longer in the ground. The indications of the mature state of a tree are by no means so evident as those of decay; but still certain signs of this state, as well as of the vigorous condition of the tree, may also be observed. (*M. Bonduelle in*

Biblioth. Phys. Econom., p. 13, and in *Jam. Phil. Jour.* 1827 p. 191.)

POISONOUS VEGETABLES.

Persons of all descriptions have frequent occasion to make some use of plants, when they are not in a situation minutely to investigate their nature and qualities. As many plants are narcotic and injurious to the human constitution, it is very convenient to have at hand, or in the memory, a few concise rules on this subject. The following have been selected with great care:—

Plants not Poisonous.

1. Plants with a *glume* calyx, never poisonous; as wheat, Indian corn, foxtail grass, sedge grass.
2. Plants whose stamens *stand on the calyx*, never poisonous; as currants, apples, peach, strawberry, thorn.
3. Plants with *cruciform* flowers, rarely if ever poisonous; as mustard, cabbage, water-cress, turnips.
4. Plants with *papilionaceous* flowers, rarely if ever poisonous; as pea, bean, locust tree, wild indigo, clover.
5. Plants with *labiate* corols bearing seeds without pericarp, never poisonous; as catmint, hyssop, mint, motherwort, marjorum.
6. Plants with *compound* flowers, rarely poisonous; as sunflowers, dandelion, lettuce, burdock.

Poisonous Plants.

1. Plants with five stamens and one pistil, with a dull-colored *lurid* corol, and of a nauseous, sickly smell, always poisonous; as tobacco, thorn apple, henbane, nightshade. The degree of poison is diminished where the flower is brighter colored and the smell is less nauseous. As potatoes are less poisonous, though of the same genus with nightshade.
2. *Umbelliferous* plants of the aquatic kind and a nauseous scent are always poisonous; as water-hemlock, cow-parsley. But if the smell is pleasant, and they grow in dry land, they are not poisonous; as fennel, dill, coriander, sweet cicely.
3. Plants with *labiate* corols, and seeds in capsules, frequently poisonous; as snap-dragon, fox-glove.
4. Plants from which issues a *milky juice* on being broken are poisonous, unless they bear compound flowers; as milk-weed, dog-bane.
5. Plants having any *appendage to the calyx* or corol, and eight or more stamens, generally poisonous; as columbine, nasturtium.

Most general rule.

Plants with few stamens, not frequently poisonous, except the number be five; but if the number be twelve or more, and the smell nauseous, heavy and sickly, the plants are generally poisonous.

NOTE. Many plants possess some degree of the narcotic principle, which are still by no means hurtful. But the use of such plants is to be deferred, till fully investigated.—*Eaton's Botany.*

BLACK PEPPER.

An elementary principle has been recently discovered in black pepper, which has been denominated *piperine*, and found to be a successful remedy in intermittent fevers. It has been employed in doses of one grain every hour, with as much success as quinine; and when combined with an equal portion of quinine, with even more effect than when quinine alone has been used.

INDIAN CORN IN ENGLAND.

Mr Cebbert has now at Barn-Elms Farm, (near London) a piece of 11 acres of *Indian Corn* which he assures us will yield him 1,200 bushels of ears; and that it will surely get ripe notwithstanding the badness of the season. He is sure that England will now become an Indian Corn country, and that in ten years, a man that should fatten a hog on *barley* would be deemed, and justly deemed, a fit subject for a mad-house.

[The humidity of the air in England, and the want of that intense heat which is so favorable to the growth of corn in this country, incline us to think Mr Cebbert is rather too sanguine in his expectations. He may, however, by obtaining his seed from this country for a few years, succeed in acclimating this wholesome and important grain.]

N. Y. Farmer.

There is at present in flower, in the gardens of the Marquis of Londonderry, at Mount Stewart, an American aloe, a native of South America, and was introduced into Britain about 1781. It is upwards of twenty one feet in height: circumference at the base five feet: the leaves average about five feet in length and one foot in breadth.

Considerable sugar has been made the past year in North Carolina. The ribband cane is said to flourish in that State, and sugar will very probably, at no distant day, be a staple article there.

There was manufactured last year, in the town of Salina, N. Y. 1,200,000 bushels of Salt, which was sold for 12½ cents per bushel, (exclusive of the state duty,) making the comfortable sum of \$150,000.

There are now in use in Great Britain, 15,000 steam engines, some of them of 600 horse power. It is calculated that they save the labor of more than two millions of men!

The average length of human life in the 16th century was only 18 years and 5 months; but owing to the improvements which have from time to time been made in the healing art, the average is now ascertained to be 35 years and 10 months, having more than doubled in the last 300 years.

WARREN BRIDGE.

The rapid advances towards the completion of this important avenue are very gratifying. The whole has been macadamized with a good depth of stone, and a five horse team, with very broad wheels, is engaged in wearing it down to a solid and even road. The foot walks are completed, and are wide and commodious. The plank walk extends some distance over the abutment on the Boston side, and the whole is to be lighted with elegant lamps at very reasonable distances. This Bridge is no doubt one of the best built bridges in the country, and reflects great credit upon those who are engaged in the business.—It draws forth the praises of all, and even those who most violently opposed the grant of a charter for its erection, now speak of it with complacency and admiration, and have come to the belief that the people have a right to build a bridge for their own accommodation and convenience, and to get into the city by the cheapest and shortest route.

On the Boston side, the city authorities have laid out a wide and commodious street from the termination of the Bridge extending almost directly

into Union street to the market, passing over the old Green Dragon estate, by the new Baptist Meeting House, in Hanover street, which forms the south corner of the new avenue. On this street the owners are now placing edge stone, and the whole is in progress. It will form a direct and very pleasant entrance to the very centre of the city.—*Bunker-Hill, Aurora.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, DEC. 5, 1825.

INSECTS ON FRUIT TREES.

In our paper of the 21st ult. page 142, we published notices of an insect or insects which infested fruit trees in Wrightsville, York county, Penn. described by a correspondent, with the signature "M." Since publishing the communication of "M." we have been favored with the opinion of Dr. HARRIS, who says in a letter addressed to us, that "the insect on the apple tree, mentioned by your correspondent 'M,' is probably one of those called *lice*, *coccus aphid*, and *American blight*. A description of the first, written by Enoch Perley, Esq. in December 1794, is published in the early communications to the Mass. Agri. Soc."

The description, alluded to by Dr. Harris, was given in our paper, vol. i. page 333; but we will here republish it, as that volume is now not easily obtained.

"Having for some years past discovered that there was a growing evil attending our young apple trees in the District of Maine, I have made some observations on the subject, which I shall communicate, in hopes they may be a means of leading to the discovery of some effectual cure.

"The difficulty is what is generally called *lice*; the appearance of which, is, in form, like half a kernel of rye (but not more than one twentieth part so large) with the flat side sticking to the smooth bark of the tree. These blisters contain from ten to thirty nits or eggs each, in form like a snake's eggs; which in a common season begin to hatch about the 25th of May, and finish about the 10th of June. These nits produce a white animalcule, resembling a louse, so small they are hardly perceptible by the naked eye; which, immediately after they are hatched open a passage, at the end of the blister, and crawl out on the bark of the trees; and there remain with but little motion, about ten days; when they stick themselves fast to the bark of the tree, and die. From this little carcase arises a small speck of BLUE MOULD, which is most plain to be seen between the 16th and the 20th of June, and continues about fifteen days; and then gradually wears off, until the old carcase appears; which by this time is formed into a new blister, and contains the spawns or nits before mentioned.

"These blisters prevent the circulation of the sap, and prove as fatal to the tree as the canker worm.

"In order to remedy the difficulty I have made many experiments within a few years; but long to no good effect, not knowing the particular season when these animalcules could be most easily destroyed. This, however, I have lately found to be between the time they hatch and that when the mould leaves them.* The application that I have

found most effectual is washing the tree with lye or brine. Lime, also mixed with lye to the consistence of whitewash, may be useful. And altho' the small branches cannot be cleansed in this manner without much difficulty, still if the body of the tree and the branches near the body are kept clean, until there comes a rough bark, the lice will not kill the tree.

"Some people have recommended the application of train oil to the tree; which indeed is a powerful antidote against lice; but being of a glutinous quality is very detrimental to the tree. Inoculation* has been proposed, which I think will have no effect at all on the lice; for I perceive that they hatch in May, on branches that were pruned off the tree in March, and the sap entirely extinguished.

"These lice are natural in the uncultivated forest, on what is called moose-wood and other bushes. "Much care should be taken [respecting lice] on their first appearing in an orchard or nursery; as the cutting down and destroying a few young trees is of no importance, compared with the difficulty of having an orchard overrun with them.

"P. S.—By Enoch Perley, Esq. dated November 19, 1804. To this extract I have nothing to add, but that the brine or pickle, with which the tree is to be washed, should not be such as has had meat salted in it; but let one quart of common salt be dissolved in two gallons of clean water."

The above description of a destructive insect, and the remedy prescribed by Mr. Perley, may be of use although the insect may not be the same with that which has annoyed the fruit trees of our correspondent "M." This writer says, "on rubbing them with the finger-nail or point of a knife, there seemed to remain a liquid darker colored than venous blood." This characteristic trait of the insect is not mentioned by Mr. Perley; still the insects may be the same.

Kirby and Spence inform us that Linné mentions an insect (*Tinea Corticella*, F) as inhabiting apple-bearing trees under the bark. And Reaumur has given us the history of a species common in this country [England] and producing the same effect, often to the destruction of the crop, the caterpillar of which feeds in the centre of our apples, thus occasioning them to fall. "The sap too, is often injuriously drawn off by a minute *Coccus*, of which the female has the exact shape of a muscle shell (*C. arborum linearis* Geoffr.) and which Reaumur has accurately described and figured.— This species so abounded in 1816 on an apple tree in my garden that the whole bark was covered with it in every part; and I have since been informed by Joshua Haworth, jr. Esq. of Hull, that it equally infests other trees in the neighborhood. Even the fruit of the golden pippin, which he sent me were thickly beset with it."

We have been assured that lice on apple trees may be destroyed by a wash, which was recommended by Mr. Benjamin Wheeler of Framingham, Mass. in a communication, first published in the New England Farmer, vol. iv. p. 348. The following is an extract from that communication.

"My way of using this preparation is to dissolve 2 lbs. of potash of the first quality, in seven quarts of water for the bodies of the trees. It is put on with a white-wash brush. If the limbs are

covered with moss or lice, I take a painter's brush, and apply the solution to the moss, &c. with care not to touch the leaves or buds. It may be done at any time of the year, when we are most at leisure. Once in from two to four years is generally sufficient. I have no general rule, however, but wash them as often as they appear to need it, which is always when the bark is not smooth."

The insect described by "M." page 142, found "on the body of the tree about the size and shape of a small grain of coffee, with a bristly coat and no wings," is, perhaps, what Kirby & Spence call "*Coccus* or *American Blight*." They say "this is a minute insect, covered with a long cotton-like wool transpiring from the pores of its body, which takes its station in the chinks and rugosities of the bark, where it increases abundantly, and by constantly drawing off the sap, causes ultimately the destruction of the tree. Whence this pest was first introduced is not certainly known. Sir Joseph Banks traced its origin to a nursery in Sloane street: and at first was led to conclude that it had been imported with some apple trees from France. On writing, however, to gardeners in that country he found it to be wholly unknown there. It was, therefore, if not a native insect, most probably derived from North America, from whence apple trees had also been imported by the proprietor of that nursery. Whatever its origin it spread rapidly. At first it was confined to the vicinity of the metropolis, where it destroyed thousands of trees. But it has now found its way into other parts of the kingdom, particularly into the elder countries; and in 1810 so many perished from it in Gloucestershire, that it was feared the making of elder must be abandoned. This valuable discovery, it is said, has since been made; the application of the spirit of tar to the bark being recommended as effectual. Sir Joseph Banks long ago extirpated it from his own apple trees, by the simple method of taking off all the ragged and dead old bark and then scrubbing the trunk and branches with a hand brush.

A GOOD CHANCE FOR A WOOLEN MANUFACTURER.

A friend of the Editor of the New England Farmer who is owner of a large landed property in one of the Middle States, writes us as follows: "I raise a good deal of wool, and when it is in my warehouse, I do not know what to do with it. I have about seven thousand weight at present (merino, mixed and common,) and have found no purchasers. I dislike the trouble of sending it to the cities for sale, and no one comes here to buy. In this dilemma I have erected a small building for a woolen factory, thirty by forty-five feet on the ground, and three stories high. It is situated on a good stream, and at the turnpike road, at a place marked on the map, which I send you. I do not wish to be concerned in conducting the business myself, but if I could find a suitable person, who would find his own machinery, and conduct the business, I would let him have free of rent the factory for two years, and also two or three small houses near it, and some ground for gardens, and keeping what cows he might want," &c. There are also other inducements and circumstances stated, which show the benefits which may be anticipated from the proposed establishment. These shall be detailed in a personal interview with the Editor or Proprietor of the New England Farmer.

* It appears from this account, by Mr. Perley, that those appearances can, in general, only occur between May 25th and July 5th.

* By "inoculation," is probably meant boring a hole in the tree and introducing quick-silver, sulphur, or some other substance offensive or destructive to insects.

Dr. Howard of Baltimore, civil engineer, in the service of the United States, has completed a model of an improved railway wagon, in which the friction is reduced to nearly one-fourth of that incident to vehicles of the common construction. Another object of the invention is to accommodate the wagon equally to a serpentine and a straight road. The description and details are shortly to be made public.

Advantages of canals, (or rail-ways).—A quantity of cherry plank and joist was landed in this town on the 17th inst. from the canal boat Providence, which grew in Michigan or Ohio, at the head of Lake Erie; from whence it was shipped down to Buffalo, thence by the Erie Canal to Albany, from that place to Providence by sloop navigation, and from Providence to this place by the Blackstone Canal, a distance, in the whole, of at least *nine hundred miles*, four hundred miles of which is an *artificial navigation*.—*Worcester Spy*.

Depravity.—The following advertisement appeared last week in the *Morning Advertiser*:—
Snug liquor shop to be let in a *Crowded gin drinking neighborhood*, where any person who is competent in the spirit trade may command a first rate business. A death in the family is the reason of this opportunity offering of realizing a good living without a risk.—*London paper*.

Home Department.—Since the Presidential contest is over, several newspapers have started the project of establishing a new department at Washington, to be called the *Home Department*.

License of Almanac Makers.—We frequently hear of the license of poets, but they are confined to their lifetime. Not so with Almanac Makers. In June, 1808, the gentleman who represented the town of Nantucket in the General Court of Massachusetts, was called on, in Boston, by Dr. —, and solicited to aid in completing the astronomical calculations for Low's Almanac for 1809 as Dr. Low was in low health. The gentleman readily granted assistance; and on his return to Boston to attend the winter session, inquired of Dr. —, who also was a member of the Legislature, after the health of Dr. Low, and learned that he had been *dead* some time. Nevertheless, Dr. Low's Almanac, ten years afterwards, contained an *animated* address, signed by the Doctor himself, returning suitable acknowledgements to the public for the generous patronage he had received;—and stating that *if his life and health should be preserved, he hoped to serve the public many years more*.—*Nantucket paper*.

Markets.—While we really believe that flour cannot be much lower this season than the present quotations, we are utterly at a loss to know what has caused the astonishing rise in potatoes, which sell in the market at 87½ cents per bushel. We verily believe that with ordinary crops, potatoes pay the farmer better at 35 cents a bushel, than any article that he sells in market. Our friends in the country should notice these prices, and bring in their produce before the market is supplied from Maine or Nova Scotia, where good potatoes are considered well marketed at 25 cents per bushel.—*Phil. U. S. Gazette*.

In Alabama the blow-fly is destroying numbers of horses, dogs and other animals.

Mr. Barbour, our Minister at London, has instructed the superintendent of his farm to sow as much wheat as possible, in consequence of the state and prospects of the market in England.

Mr. Sparks, who went to Europe last spring, to collect materials for illustrating the life of Washington, &c. has experienced the utmost liberality and courtesy, in Germany, France and England.

The culture of silk has been commenced in Ohio, and the agricultural societies offer premiums for the cultivation of the silk worm.

Sugar is made in South Carolina from water-melons, which grow there in great perfection.

We understand, says the National Intelligencer, that the Secretary of the Navy has tendered to Capt. CATESBY JONES, of the Navy, the command of the sloop of war Peacock, now fitting at New York, for the voyage of exploration in the Pacific and South Polar Seas, pursuant to a resolution of Congress of the last session, and that he has accepted it.

Great sale of Wool.

ON THURSDAY, DECEMBER 18, AT 10 O'CLOCK,
At the Hall over the New Market.

219 bales Saxony WOOL, consisting of first and second Electoral—first and second Prima, Secunda, and Tertia.
246 bags Leonessa Sorianna Segoviana Spanish Wool.
130 bags Portuguese Wool.
130 bags (about 76,000 pounds) American Fleece Wool, among which are some choice lots of selected Saxony and full blood Merino fleeces.
Catalogues will be ready for delivery and the Wool may be examined three days before the sale.
Coolidge, Poor & Head—Auctioneers.

Kenrick Nurseries.

100 Choice varieties of Ornamental hardy trees and shrubs, just received from New York, and selected in June last.
This establishment situated but an hour's ride from Boston, contains a very extensive assortment of Apples, Pears, Plums, Peaches, Apricots, Quinces, Grape Vines, Mulberries, Currants, Raspberries, Strawberries, &c. and a general assortment of Ornamental trees, shrubs, &c.
Also, the following fruit and ornamental trees of extra sizes, viz. Flowering Horse Chestnuts, Mountain Ash, Weeping Willows, Ailanthus, Catalpas, Purple Acacia, Dutch Cork Elm (a new article) Butternuts and Silver Firs.
300 Isabella Grape Vines; and White Mulberry Trees by the thousand.

Written orders addressed to John or William Kenrick, and directed to the Newton post office, will be promptly attended to, or they may be left at Mr. Joseph Bridge's Grocery and Seed store, Court street, Boston, where lists of the above may be seen. Trees will be packed in mats for shipping, when ordered, and delivered in Boston free of charge. St. Nov 21

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts. a paper. They were gathered by a gentleman familiarly acquainted with the sorts, expressly for us. They will be sold by the single paper, or packed to order, in any quantity.
Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the *Rheum Undulatum*, or Tart Rhubarb, or Pie Plant, an excellent article for summer use. (See N. E. Farmer, vol. vi. page 290, and page 11 of this volume, and Fessenden's New American Gardener, article *Rhubarb*, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts. per root

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.
Just received at the

New England Farmer Seed Store,
No. 52 North Market, Street—Boston.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

The collection of LILIES is very splendid, comprising a great variety of colors.

HYACINTHUS—(double and single.) dark blue, porcelain blue, red and rosy coloured, pure white, white with yellow eye white with rosy eye, and yellow with various eyes; from 25 cts to \$1 00 each.

TULIPS—splendid variegated, red, yellow, and mixed, 12 cts. each, \$1 00 per dozen.

CROWN IMPERIALS—assorted, of the most splendid colours, and showy flowers, large roots, 33 cts. each.

JONQUILLES—sweet scented, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots 33 cts. each.

DOUBLE NARCISSUS—fragrant, of all colors, 19 cts. each.
SPRING CROCUS—of all colours, 6 cts. each. 50 cts per dozen.

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinth having produced bells 1 inch and 3 1/4 inches in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the mere refuse of the most inferior collections, good roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for us—For sale by the lb. or ounce.

New England Farmer Seed Store,

No. 52 North Market Street—Boston.

MISCELLANIES.

From Drummond's First Steps in Botany.

ST. JOHN'S DAY.

In times more unenlightened than the present, a number of superstitious ceremonies were practised on midsummer eve, and on the following morning, or St. John's Day. They bore some resemblance to those of Hallow-eve in Scotland, being thought to prognosticate the good or bad fortune of young men and maidens as to their obtaining partners for life. Some of these are still practised on the Continent; and in Lower Saxony, the young girls gather sprigs of St. John's wort on midsummer-night, fasten them to the walls of their bedchamber, and by the state of the sprig on the ensuing morning, anticipate whether or not their state shall soon be changed from one of "single blessedness." If the plant remain fresh, (which will entirely depend upon the dampness or dryness of the wall,) a suitor may be expected: if it droop and wither, the willow-garland must be their fate for the ensuing year. This superstition has given origin to the following beautiful and affecting lines from the German:—

The young maid stole through the cottage-door,
And blush'd as she sought the plant of power;—
"Thou silver glow-worm, O lend me thy light!
I must gather the mystic St. John's wort to-night,
The wonderful herb whose leaf will decide
If the coming year shall make me a bride."

And the glow-worm came,
With its silvery flame,
And sparkled and shone
Thro' the night of St. John,
And soon has the young maid her love-knot tied,
With noiseless tread
To her chamber she sped,
Where the spectral moon her white beams shed:—
"Bloom here, bloom here, thou plant of power,
To deck the young maid in her bridal hour!"
But it droop'd its head, that plant of power,
And died the mute death of the voiceless flower:
And a withered wreath on the ground it lay,
More meet for a burial than bridal day.

And when a year was pass'd away
All pale on her bier the young maid lay,
And the glow-worm came,
With its silvery flame,
And sparkled and shone
Thro' the night of St. John,
As they closed the cold grave o'er the maid's cold clay

"Oh! he does not want it!"

But he *does* want it. And even if he did not, your engagement has nothing to do with his private circumstances.

Such is the self-excusing of many a careless creditor, and such the proper answer.

It is to be lamented that there is no charge to which many, who may be good men, are more subjected than the want of punctuality in the payment of little debts. And there is no plea by which conscience is more readily satisfied, than that of the declaration that the creditor does not need the amount. The same thing applies to a hundred little borrowings.

A book is lent; it is detained until the lender is unable to recollect the borrower—but then "he does not want it—he has many others, or he has read it already." But he does want it. If he has read it, it is no reason why he may not lend it to others, as well as to yourself.

A small subscription is due; "the society does not want it—the sum is so small that it can make no difference." But the society does want it. If every member did as you do, there would be no funds in the hands of the treasurer; and your neglect is dissolving the society as far as your own item of influence goes. That influence goes thus far to discourage schemes of benevolence, and to destroy public confidence. You inspired a hope which you crushed again.

An editor's payment is due—he does not want it." But he does want it. And this very plea of years gives him more trouble than all the others put together.

Of truth, there are few excuses for neglect more frequently given to the reminders of conscience than this expression. It sets aside, with the veriest sophistry, the spirit and essence of moral obligation.—*Charleston Observer.*

Squinting.—Children, when they first begin to perceive, always turn anxiously to the light. Besides the agreeable sensation, the retina is strengthened by the action of the rays. Whenever therefore, care is not taken so as to place the infant that the light may strike both the eyes equally, one generally becomes stronger than the other; and it is sufficiently known to parents and nurses, that one primary cause of "ocular indecision" (as we have heard it styled,) is an inequality in the strength of the eyes.—*London Weekly Review.*

Rump Parliament Records.—A late number of the Providence American has called the attention of the public to a curious collection of MSS. which are in the possession of the New York Historical Society. The manuscripts are eighteen in number, and purport to be the Journal of the House of Commons during the protectorate of Cromwell. As to their authenticity there can be no doubt, from the various arguments by which it can be established. These are the hand-writing, which corresponds with that of the age of Cromwell; the binding and paper; and the improbability that any one would take such a vast deal of trouble as it would require to forget them.

The probable manner in which they came into the country is explained as follows. Three of the regicides, Goff, Whaley, and Dixwell, fled to this country, and brought these records with them.—They then passed through various hands, till they came into the possession of Gov. Livingston of New Jersey, by whom they were presented to the Historical Society of New York.

This Society has been for some time in a decayed state, and these Journals, with some other papers of value, have lain neglected in their library. We must confess that we are astonished that these Records have not before this excited attention; and especially that they should have been first brought before the public by a Providence editor, when there are so many on the alert in New York to communicate the earliest intelligence. It would seem as if they had all been too much engaged in politics to pay any attention to these minor and unimportant matters.

We hope that these Records will be looked into before many more months, and a full account of them be laid before us. It is time that we knew something about them, if they are really, as there is little doubt, the true *Records of the Rump Parliament.*—*Mass. Journal.*

MUNROE & FRANCIS have just published the 2d edition of the *House Servants' Directory*, or a Monitor for Private Families; comprising hints on the arrangement and performance of Servant's Work, with general rules for setting out Tables and Sideboards in first order. The art of Waiting in all its branches; and likewise how to conduct Large and Small Parties with order; with general directions for placing on Table all kinds of Joints, Fish, Fowl, &c. &c. Nov. 28.

Wants a Situation.

A young man lately from England, well acquainted with farming. Testimonials for sobriety, honesty and capability will be produced. Apply at this office. nov 28

Subscription for Fine stock for the finest table Grapes

A Farmer, at the Horticultural Garden, Brooklyn, corner of the Jamaica and Flatbush road, two miles from New York, having been urged by several lovers of the vine to propose sets of the best kind for sale by subscription offers to the public sets of a dozen vines, with good roots of the most select and choice grapes for the table; many of which are quite new in this country, and all of which will ripen perfectly in any situation either in town or country.

Names of the twelve Sorts.

1. White Chasselas, with large fruit
2. Chasselas of Fontainebleau, near Paris
3. Yellow Chasselas of Thomery, near Paris
4. Golden Chasselas, the real genuine
5. Musk Chasselas
6. Chasselas, with very large black fruit
7. Red Chasselas
8. White Muscat, or black Constantia
9. Red Muscat
10. Black Muscat, or black Constantia
11. Black Orleans, bears very well the frost
12. Black Gamet, yields a second crop of blossoms and fruit when the first are frozen.

Nos. 11 and 12 are as fine for vineyards as for the table, the fruit is not so excellent as that of the preceding kinds, but is equally valuable on account of the certainty of a large crop annually.

The subscription receipt will be accompanied by directions on the best mode of cultivation, planting and pruning the vine.

The same sort of vines may be had separately, price One Dollar, except No. 1, Golden Chasselas, the genuine, which is Two Dollars. Communications for the above, and subscriptions to his establishment post paid punctually attended to.

References, Dr. David Hosack, President of the Horticultural Society, Dr. Pashley, President of the Linnean Society, Dr. McNeven, Dr. Mitchell, Dr. Stevenson, and Hon John Lowell. Nov. 11

Wine and Table Grapes.

A complete assortment of FRENCH VINE ROOTS in punie order, just received and for sale at a low price, by E. Copeland Jr. at the Dupont Powder Store, 65 Broad Street. CAMMUNION as usual. 30.

Full Seeds.

A small collection of seeds suitable for sowing in the autumn only, among which are the Lime Plant (*Podophyllum peltatum*) Snowberry (*Symphoricarpos racemosa*) Dwarf White Flowering Horse Chestnut, Pink Mezereon, Martagon and Superb Lily, &c. in papers of 12 cents each.—An account of the Lime Plant will be found in Fessenden's New American Gardener, pag. 123: we have but a small quantity of this seed.

New England Farmer Seed Store,

No. 52 North Market Street—Boston.

MUNROE & FRANCIS have just published the 2d edition of a work called *Seventy-Five Receipts for making Pastry, Cakes, and Sweetmeats*. By a lady of Philadelphia. With a series of miscellaneous receipts for Dishes in use at Supper Parties; also, a complete list of weights and measures, whereby weight can be ascertained by measure.

Pear Trees and Grape Vines.

For sale at the house of Samuel Downer, in Dorchester, 200 Pear Trees of the choicest varieties. 100 Isabella and Bland's Virginia—2 native and 2 Sweet Water Grape Vines from 2 to 3 years old. Also, a variety of Rose Bushes, Ornamental trees, white lilies, &c. Apply to Rufus Howe on the premises. Dorchester Nov. 21. 31.

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be published to-morrow, the *New England Farmer's Almanack for 1829*. By Thomas G. Fessenden, Editor of the New England Farmer. For sale, wholesale and retail, at the N. E. Farmer office, No. 52 North Market street, by Bowles & Dearborn, 59 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$1 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VII.

BOSTON, FRIDAY, DECEMBER 12, 1828.

No. 21.

HORTICULTURE.

PENNSYLVANIA HORTICULTURAL SOCIETY.

The adjourned meeting held on the evening of the 17th instant, at Philosophical Hall, was very well attended. The display of flowers was less imposing than on some former occasions, although quite attractive. Many of those exhibited had braved the pelting of the snow storm of last week without loss of beauty or sweetness. Chrysanthemums of almost every shade were particularly admired, fifteen varieties of this favorite flower were presented by *Alexander Parker*, from his establishment on Prime street. The same enterprising gardener brought forward several beautiful species of roses, new daisies, geraniums, &c. comprising about 40 different specimens, all of which were carefully labelled with the generic and specific names. We hope this excellent practice will be generally adopted. A specimen of the *Campanula Pyramidalis*, plucked from a plant in *A. Parker's* collection, was particularly noticed; the plant is 5 feet high, has been flowering for more than three months, producing innumerable flowers of great beauty; it well deserves to be ranked among the choicest ornaments of the green house. The Society was also favored with a very fragrant and beautiful bouquet of flowers from the garden and green house of *D. & C. Landreth*; also a flowering plant *Camellia Sasanqua*, the chouchan of the Chinese, the flowers of which are used with those of the olea fragans, to perfume Soucheong tea. [Staunton's Embassy, vol. 2d page 467.]

Six samples of wine made near our city, were sent for examination, three bottles of which were presented by *Mary Smith*, of Burlington, N. J.; two of them the juice of native grapes, the other made from currants. The specimen made from skinned grapes, with white sugar, was particularly admired for its pure whiteness and delicate flavor, forming a very agreeable and wholesome cordial. A bottle of currant wine two years old, from *Edward H. Bonsall*, near Germantown, was pronounced very good; another bottle of the same kind, five years old, from *Jno. Graff*, Philadelphia county, was tasted. It is thought that currant wine does not improve by age. *D. Landreth, Jr.* presented a bottle of *Rapp's* [Harmony] wine, it was considered very fair, but did not quite answer the expectations raised by our complaisant visitor, *Deke Bernhard*, who doubtless was served at Harmony with a bottle of very superior. *Col. Carr's* wine sustained its reputation. *George Esher*, [Ridge Road] presented a bunch of turnips, weighing 4 lbs. each, the seed of which was given him two years ago, by our late respected citizen *J. H. Roberjot*, [late a member of the Pennsylvania Horticultural Society, and a warm friend to its objects,] who received it from France; the grower, who has for many years attended particularly to the cultivation of this vegetable, considers these turnips altogether superior to any he has raised before, on account of their solidity and sweetness; he did not designate them by any new name.—*John Esher*, of Penn township, presented two enormous cabbages weighing 16 pounds each, the produce of his garden. One might suppose they

would supply a Dutchman's family with *Sour Kraut* for a twelvemonth. With such evidence before us, no one need doubt the fertility of our soil. Upwards of 20 varieties of apples and pears challenged the special attention of the members. Among them were the *St. Germain* and spice butter pear, various kinds of pippins, such as the *Melton*, golden, &c. the *Spitzenberg*, the wood apple, *Bay's Greening*, &c. We regret that many of the best flavored, were not labelled, and could not be certainly identified. We also regret that the names of the producers were not furnished. The fruit was said to be principally from the orchards of Burlington and Gloucester counties, N. J. and from Philadelphia and Bucks counties Pennsylvania.

In concluding this hasty and imperfect notice, we would return our thanks, on behalf of the Society, to such persons as have presented specimens of their horticultural products, and express a hope that others will follow so worthy an example, which cannot fail if generally adopted, of becoming the means of collecting much information of practical utility.—*Phil. Aurora*.

At the annual meeting of the Pennsylvania Horticultural Society, held at the Philosophical Hall, on Monday the 24th ult. the following gentlemen were elected officers for the ensuing year.

President—*Zaccheus Collins*.

Vice Presidents—*Horace Binney*, *David Landreth*, senior, *James Mease*, *M. D. Charles Chauncey*.

Corresponding Secretary, *David Landreth, Jr.*—Recording Secretary, *David S. Brown*—Treasurer, *Marmaduke C. Cope*.

Council—*George Pepper*, *Col. Samuel B. Davis*, *Thomas Astley*, *Matthew Carey*, *Thomas Biddle*, *Robert Carr*, *Daniel Maupay*, *Thomas Hibbert*, *Thomas Landreth*, *Moses Brown*, *Nicholas Biddle*, *Jacob S. Wain*.

From the Delaware Advertiser.

SHEEP.

We have often, in the course of our agricultural life, had occasion to notice the destruction from disease, which has been made among sheep, particularly lambs, and with what marked indifference the loss of ten or twenty of these valuable animals was viewed by their owner, without a single attempt to enquire into the nature of the disease, or make one experiment to remove its cause. It is much to be regretted, that every farmer who attempts to raise sheep does not, by some means, put himself in possession of some information relative to diseases which are liable to invade the health of his flock.—We do not know a more ready and cheap source from which to obtain this information, than newspapers.

A late writer, upon diseases incidental to sheep, states that he has discovered the cause of a malady, (the cough) which has, at times, made the most destructive havoc among our flocks. He derives his information from the carcass of a lamb, which he dissected, and found deposited in its lungs a large quantity of worms, which, no doubt were the cause of its death. The writer thus remarks:

"Feeling a lively interest in the prosperity of

the sheep business in this country, having a flock myself, I have thought proper to communicate the following facts and observations to the public, with a view to excite inquiry and elicit information in relation to that disease which has carried off so many of these useful animals.

Some time in February last, I looked at a flock of yearling lambs, (about 200 in number,) belonging to *J. R.* which I had seen in the fall; at this time they were in a thriving condition. In February when I examined them, several had died and the remainder were very poor, and a general cough prevailed amongst them, which increased with a shrill sound, a dull and heavy appearance, and extreme emaciation. Some time after, I dissected a sheep of this flock, which had fallen a victim to this disease. * * * *

I laid the lungs open, and in the cellular substance of the lungs and in the bronchial vessels, there were a multitude of worms about as thick as a linen thread, and from one to six inches in length, exceedingly sharp pointed at one end, and that end of a chestnut brown color, the rest of it of a pale white color. In a day or two after, I dissected another sheep while it was yet warm, and found the appearance precisely the same, only that the worms were alive, in the other they were dead. I directed Scotch snuff to be given to the sheep which seemed to be diseased, on their food morning and evening, and tar and sulphur once a day. They appeared to improve in health immediately. The same application was used in a neighboring flock, and apparently with good effect. Whether it is a remedy for the disease I will not undertake to decide, as but one or two experiments have been made; but it may be deserving a further trial.

BUTTONS.

Three or four years ago *Mr Samuel Williston*, of Casthampton, began to make cloth buttons, and the manufacture has gradually extended in that and other towns in this vicinity, employing some hundreds of industrious females, who are thus enabled to support themselves, and lay up something for a "rainy day," or a "setting out." It is estimated that 25,000 gross of buttons have been made within 10 miles of this place since the first of January last. They are sold at Boston and New York, and thence find their way to all parts of the United States. Competition has reduced the price and the profit, and the business is not very lucrative at the present time. The molds are made in Williamsburgh by females, and are sold at about 6 cents per gross.

The manufacture of these small articles affords some evidence of the benefits of the "American System." Before *Mr Williston* began to make cloth buttons, England supplied the whole United States, and the wholesale price was two dollars per gross, and sometimes more. Now the Yankees supply the country with buttons superior to those which were imported from England, and the wholesale price is from 75 cents to one dollar per gross.—We are told that military buttons which were sold at three dollars per dozen when imported from England are now manufactured in this country for one dollar per dozen.—*Hamp. Gaz.*

From Memoirs of the Board of Agric. in the state of New York.

ON THE MANAGEMENT OF COWS.

Having formerly kept a large number of cows, I observed many amongst them that dried up their milk so early in the fall, that they were not profitable, while others, with the same keeping, gave milk in plenty until late in the season. I likewise have often heard my neighbors observe, that some of their cows, though very good in the fore part of the season, dried up of their milk so early, that they were unprofitable, and they should have to put them off; I accordingly found it expedient to find out the cause, if possible: and when I brought to mind the ways that some of my young cows had been kept and milked, I attributed the cause to the milking of them the first season they gave milk; and by many experiments since, I have found that young cows, the first year they gave milk, may be made, with careful milking and good keeping, to give milk almost any length of time required, say from the first of May to the first of February following, and will give milk late always after, with careful milking. But if they are left to dry up of their milk early in the fall, they will be sure to dry up their milk each succeeding year, if they have a calf near the same season of the year; and nothing but extraordinary keeping will prevent it, and that but for a short time. I have had them dried up of their milk in August, and could not by any means make them give milk much past that time in any succeeding year. In 1820, I had two heifers, which had calves in April, and after getting them gentle, I set a boy to milk them for the season, (which is often done the first season on account of their having small teats;) he was careless, and dried them off in August. Although I feel satisfied I should lose the greater part of the profit of them afterwards yet I took it upon me the following year to milk them myself, and give them good feed, but to no purpose. I could not make them give milk much past the same time they dried the year before. I have two cows now that were milked the first year they had calves, until near the time of their calving again, and have continued to give milk as late ever since, if we milk them.

[Further Extracts from Vernon's Treatise on Mulberry Trees, Continued from page 154.]

OF THE CHOICE OF SOIL FOR A NURSERY OF MULBERRY TREES, AND OF THE MANNER OF SOWING THE MULBERRIES.

A soil mild, light, and mixed with much mould is the proper soil for a nursery of mulberry trees. New shoots must have ground easy to penetrate. Strong, clayey land does not suit these new plants, unless, by mixing with it a great quantity of sheep's dung and sand, it may be made light and friable. Thus prepared by this manure, and by three dressings with the hoe, or by ploughing it three times, and afterwards levelling the ground, it will be fit to receive the seeds of the mulberry.

Upon two acres of land, or any other quantity, at the will of the proprietor, beds must be made four feet wide, levelled and smoothed with the rake.

On these beds must be traced by a line, eight small furrows lengthwise, two inches wide and very little more than half an inch deep, and at the distance of six inches from one furrow to another.

At the moment of establishing this nursery, it

is necessary to be provided with mulberries from the white wild mulberry tree, or else from the Spanish mulberry tree, which are the two most proper kinds for this purpose; they must then be dropped in the furrows at the distance of twelve inches from each other, must be covered from the sides of the furrows, and the beds carefully levelled off with a short toothed rake.

There are two seasons for making nurseries; the spring and the time of the maturity of the fruit. Those who choose to sow the seed of the mulberry in the month of April, must consequently use the dried seed, gathered nine months before, and less apt to sprout. But those who sow the grain at its maturity, enveloped with all the moisture of the fruit which seems intended for its nourishment and to give it, if we may use the expression, its first milk, have generally the pleasure of seeing it put forth with vigor. Besides, the heat of the season, provided the proprietor have the attention to water the plants, will necessarily cause their rapid growth.

OF THE MANNER OF MULTIPLYING MULBERRY TREES BY CUTTINGS.

The soil chosen to receive the slips of the mulberry tree ought to be prepared in the same manner with that for sowing the seed, and which we described in the preceding chapter. The cuttings of the mulberry tree are to be planted as we plant the cuttings of the vine; that is by making furrows by a line at the distance of six feet from one to the other, and by crossing them by furrows at the same distance in order to form squares. A two years old branch of a mulberry tree, having wood of four or five years at one end, must be selected, and the extremity of the old wood must be interred to the depth of about ten inches. The branches, chosen from the white or from the rose mulberry, must be taken off in the spring at the time of the first rising of the sap. Two or three incisions must be made in the joints or knots of the old wood, because this operation will facilitate the shooting of the roots, which always put forth from the joints of the old wood. The cuttings must then be covered with a well manured and pliable earth, and the end of the branch which rises from the soil must be cut off at the third bud from the surface. If rains should not frequently occur after the plantation is finished, it would be necessary to water the plants often. The multiplication of mulberry trees by means of cuttings has the important advantage of a produce of two years in advance over the establishment of a nursery by the means of seed.

OF THE MANNER OF MULTIPLYING MULBERRY TREES BY LAYERS.

To make layers is to force a branch or a shoot of a tree or of a shrub to become itself a tree or a shrub, by putting a branch or a shoot into the ground without separating it from the parent tree. The spring and autumn are both suitable seasons for this operation. There is no precise time for making layers in autumn. Every day of that abundant season is at the service of the cultivator; he has only to choose those that suit him best. In the spring he is more restrained, for he must wait till the frosts are passed, and till the mulberry be in sap.

The shoots which arise at the foot of a tree:—the young and smooth branches found about the lower part of the mulberry; and other branches that are long and supple enough to be secured in

the ground, and lastly the shoots of a young tree, whose trunk is not high, and which may be laid as easily as the young shoots of the vine; all these offer abundant resources to the man who has industry to use them. We will now give the manner of performing each of these operations.

1st. If there arise some vigorous shoots at the foot of a mulberry tree, a hole must be dug six or eight inches deep, near each shoot, into which the shoot must be laid, without twisting it, or separating it from the tree. It is then to be secured in its place by crotchets of wood, and covered with good mould, which must be pressed over it, and the end of the shoot which rises above the ground must be cut off above the second bud. It will be further necessary to place by the side of the layer, a stake to mark the place and prevent its being trodden. It must likewise be watered immediately after the operation, and as often afterwards as may be necessary, to maintain about it a proper state of moisture.

2d. The young and smooth twigs among the branches of the mulberry may be passed through a basket or a vase perforated at the bottom, and filled with earth well manured. The twig must be cut off four or five inches above the vase of the basket, and the mould must be kept in a due state of moisture by frequent waterings.

3d. When a mulberry tree is well spread, and the boughs nearest the ground have not been lopped, some of the branches at the distance of six feet from each other, may be bent down and secured in the ground, so that the ends shall not rise more than six or eight inches above the surface. The same attention as to staking, manuring &c. must be pursued for the complete success of this method as well as for all the others. This manner of making layers is perhaps the easiest and most profitable, because the success of a branch may yield several trees, and it proves at the same time the infinite resources and power of vegetation.

If we have any young, grafted mulberry trees, whose trunks are not high, with four or five smooth and vigorous branches, we may open as many trenches, nearly as long as the branches, and eight or ten inches in breadth and depth. The roots of the little tree are cut off on the side opposite to the trenches; the earth is taken from about the trunk, and the tree inclined towards the openings in order to secure, with less risk of fracture, each branch in its proper place. The trenches are then filled and watered as in the preceding cases. The ends of the twigs are brought about six or eight inches above ground, and a prop is placed near them for their support, and to prevent their being broken under foot.

The young mulberry tree, from which we have made these layers, must be weakened by this procedure; it would droop and perhaps perish if we did not repair its losses. This tree, deprived of half its roots, is nevertheless forced to nourish all the layers. It is therefore necessary to give to the roots which remain, that increase of strength to be derived from manure and water.

All the layers made in these four different ways may be separated from the parent tree in the autumn of the second year. We prefer the autumnal transplantation, provided it do not freeze, to that of the spring. It is unreasonable to expect that a tree should perform two such opposite functions at the same time, as the settling itself by the roots immediately after removal, and the putting forth

new shoots? This is, however, the operation which we require of the spring transplantation, and which is the real cause of the feeble vegetation that attends the first season after the removal. But the autumnal planting offers a more favorable result; because the roots not only become firmly fixed in their position, but put forth before the severe frosts, numerous small fibres, which powerfully contribute to the flow of the sap in the following spring, as it generally appears by the abundance and the vigor of the new wood. Pulp trees, with a large pith, such as the Madeira walnut or the fig, whose bark when young is so apt to be affected by rigid cold, and even by white frosts, are perhaps the only sorts of trees that ought preferably to be planted in the spring.

After ascertaining that the layers have taken root, they must be cut off four inches from the parent trunk; be taken up carefully with their roots and small fibres, and placed in the nursery, or permanently established in an orchard. In the nursery they must be set at the distance of six feet from each other; and in the following year, by heading them down, four or five layers may be made from each. By these means, one hundred trees may be increased, in four years, to eighteen hundred; for the parent trees, after the layers are separated from them, being replaced in a straight position, secured to a prop, manured and watered, generally retrieve their strength and make productive trees.

If the young layers be planted in an orchard, the same care must be taken of them as when set in a nursery. Trees in the early stages of their expansion, like the growth of young animals, require an abundant nourishment. Four tillages each year with the hoe or the plough; frequent waterings if the season should be dry; manure worked into the ground in October; all this is scarcely sufficient for a new plantation. We must besides, two or three times in the course of the summer, take up the weeds which grow near them, and throw them at the foot of each tree.—We consider these weeds useful not only as a manure, but as a hindrance to the lodgment of insects which dislike the mephitical air arising from vegetables in a state of decomposition.

When the layers are separated and carefully taken from the parent tree, if they be placed in a nursery, they must be set as we have before said, at the distance of 6 feet from each other; but if in an orchard, they must be placed in quincunx order, thirty feet apart.

From the American Farmer.

TO PROMOTE THE GERMINATION OF CERTAIN SEEDS.

MR SKINNER—A correspondent in one of the late Nos. of the Farmer, inquires, what is the best method of propagating certain forest trees, named in his communication. With regard to the ready vegetation of seeds I will mention my experience as to two of the kinds enumerated. *Gleditsia* and *Robinia*, (Honey Locust and Black Locust.) About the time of planting Indian corn, or a little earlier if the weather and ground permit, the seeds may be planted.

Twelve or twenty-four hours before planting, place the seeds in a tub or other suitable vessel, and pour upon them a quantity of *boiling water* sufficient to cover them, and let them stand in it until ready to plant. This preparation of certain kinds of seeds is probably known to many persons,

but as it has not, so far as I know, been frequently noticed in print, perhaps it may be proper to give it a place in your excellent paper.

I have tried it with the two above mentioned seeds with the best success, and I believe my father generally practises the same method with Indian corn, which by that means germinates much sooner and of course escapes accidents. I have no doubt that many hard seeds which are difficult in germinating would be essentially assisted by the above process. If this is all well enough known already, omit it. The seeds of white mulberry, I have steeped in *hot*, but not boiling water, with success.

Would not a good article on the means of facilitating the ready germination of seeds be very useful. Many we know are slow and uncertain to germinate readily, the *cratogeomys* (Thorn Quicks) for instance, and a year's preparation is rather tedious, troublesome and discouraging to those who would cultivate hedges, &c.

Frost and boiling water are powerful agents in this matter; but who except a few gardeners and nursery-men, know exactly to which of these, (or other agents,) to expose their seeds, or what kinds of seeds will be aided in their germination by them?

Has boiling water been tried upon wheat and other grains, beans, peas, &c. &c.

Dayton, Nov. 24, 1828. JOB HAINES.

From the Western Review.

ON THE OIL OF PUMPKIN SEEDS.

To Dr. C. L. Seger, Northampton, (Mass.)

Your inquiries respecting pumpkins, which have lately reached me, I hasten to answer to the best of my knowledge.

I understood that pumpkin seeds were pressed like rape seed, and of course cold; when I added "*or like flax seed*," it was because I had never seen flax seed or linseed pressed warm after roasting, as you say it is done with you.

Pumpkin seeds, being very oily, and containing thin oil, require no heat to help the effect of the press. They will yield their oil to the press as easily as almonds, walnuts, and seeds of the melon tribe.

The Harmonists press this oil in the press used for rape seed oil.

I do not think that the pumpkin seed oil can be employed, like linseed oil, for painting. It is too thin and fluid, but it will answer in the instances where walnut oil is employed, being similar to it in that respect, although otherwise much sweeter and less desiccative.

Pumpkin bread and cakes are much used in the interior of the state of Kentucky, as pumpkin pies in New England. The bread is made either by itself or mixed with corn meal, by kneading pumpkins either raw or boiled, and baking them immediately afterwards, without any addition of yeast. It has, therefore, a great similarity to corn bread, and is eaten either warm or cold. It is very sweet and of a reddish color: I cannot say it is very palatable to me, but those that are used to it like it well. You know that corn bread is not liked at first by many persons. I think that the best pumpkin bread is that made by uniting equal parts of corn meal and boiled pumpkins.

Respecting the cultivation of pumpkins, I can hardly give you any additional information. Their culture is well understood all over the country, and all the farmers know how to avail themselves of

the facility which they have of growing among corn, without injury to either crop. I do not conceive that any positive advantage might result from their separate cultivation. But manures might be highly beneficial in either instance, and would increase the crops.

I remember the following additional uses which may be made of pumpkins.

1. The cakes, remaining after the oil is pressed from the seeds, are eaten greedily by cattle and hogs.

2. In Europe, they make good preserves of pumpkins, by cutting them in slices and boiling them for a long time in strong syrup of sugar.

3. In the south of Europe, a very good soup is made by mashed or diluted pumpkins with oil, butter, or broth. This dish is called *furlata* in Tuscany. Rice is often added to it.

4. The hard skin of pumpkins, if uninjured, may be used for pails, buckets, baskets, &c. The pumpkins may be made to assume almost any shape, by being confined while young, in wooden or hard vessels, which they will fill gradually, moulding themselves to their shapes.

C. S. RAFINESQUE.

Prof. of Botany and Nat. Hist.

Transylvania University, Sept. 10, 1828.

Lapland glue.—The bows of the Laplanders are composed of two pieces of wood glued together; one of these of birch, (which is flexible) and the other of the fir of the marshes, (which is stiff) in order that the bow, when bent, may not break; and when unbent, it may not bend. When these two pieces of wood are bent, all the points of contact endeavor to disunite themselves; and to prevent this, the Laplanders employ the following cement. They take the skins of the largest perch, and having dried them, moisten them in cold water until they are so soft that the scales may be freed from them. They then put four or five of these skins in a reindeer's bladder, or they wrap them up in a soft bark of birch tree, in such a manner that water cannot touch them, and place them, thus covered, into a pot of boiling water, with a stone above them, to keep them at the bottom. When they have boiled about an hour, they take them from the bladder or bark, and they are then found to be soft or viscous. In this state, they employ them for glueing together the two pieces of their bows, which they strongly compress, and tie up until the glue is well dried.—These pieces never afterwards separate.—*Trans Stockholm Acad. of Science.*

The Cherokee Phoenix confirms the statement from the Georgia Athenian, describing a species of fly said to be very dangerous to animals. These flies have lately made their appearance in the Cherokee country. The Phoenix also uses the following language in reference to the ravages of this insect.—"We have heard of several animals that have been afflicted by these strange visitants.—But only one case where a living person has been fly-blown has come to our knowledge. This person was still living by the last accounts. It is said whenever these flies penetrate the flesh they cannot, without great exertion, be extricated."

The New York Enquirer says there are 22 piano forte manufacturers in the city of New York, who dispose of 800 piano fortes in a year. Ten years ago all our musical instruments were imported from Europe.

CONTRIBUTIONS TO ENTOMOLOGY.

No. VI.

GENUS DYTISCI. [Concluded.]

The Dytisci are said to deposit their eggs in the bodies of dead aquatic animals. Roessel states that they are hatched in ten or twelve days; the larva comes to its growth the same season, when it leaves the water, and forms for itself an oval cavity in the earth; in this it remains about fifteen days before it becomes a pupa, and in fifteen or twenty days more it is changed to a perfect insect.

The larva is elongated, convex, thick or swelled in the middle and tapering towards the extremities; it is of a brownish color above, and whitish beneath. The neck is distinct, the head large, with a pair of powerful curved jaws, that are adapted for suction, being hollow within, and perforated near the tips with an oblong slit. Like most other larvae, it is furnished with several small eyes, five or six in number on each side of the head. To each of the three first segments nearest the head is attached a pair of slender legs, finely fringed with hairs. There are six spiracles on each side of the body, for the purpose of expiration. The last segment is conical, the sides fringed with hairs, which give it the power of a fin, it is terminated at tip with two conical prominences, each perforated with a spiracle, through which the air is admitted in inspiration. Beneath the tip, and forming an angle with the body are two moveable, slender and short, conical filaments. These caudal processes serve to suspend the larva at the surface of the water, and retain the end of the tail above it, so that the air may enter the anal spiracles when the insect wishes to inhale it. They are called natatory laminae by Mr. Kirby, and are supposed by him to be employed as oars in swimming; this, however, appears to be principally performed by the vermicular motion of the tail.

Several accounts are given of the voracity of these larvae. Some of the large species attain to two and a half inches in length, and are said to attack and destroy fishes much their superiors in size. Having fixed their strong curved jaws in their prey they suck their juices through these perforated organs, and afterwards devour their solid parts piecemeal.

Beside those described here, several other Dytisci are found in this vicinity; namely, *DYTISUS scutellatus*, Say, and another equally large species; *DYTISUS liberus* COLYBRATES *venustus*, *c. fenestratus*, *c. obtusatus*, *LACCOPHILUS maculosus*, *HALIPLUS 12-punctatus*, of Mr. Say; and various other species at present undetermined.

If among the insects which we have already or may hereafter publish as new there are any which have been previously described:—those who are competent to decide are most respectfully requested to communicate personally with us on the subject, and their information will be duly and thankfully acknowledged.

GENUS COLIMEETES.

c. suturellus. Beneath black; head and thorax pale testaceous, the former with two triangular spots between the eyes, the latter with an oblong apical ochreous, and (except the margins and suture) with numerous confluent tortuous lines and spots black; pectus pale ochreous; feet pale piceous.

Length between eight and nine twentieths of an inch.

Specimens nine. Extremely like *c. collaris*, Gyllenhal, and may prove to be a variety of that European species, from which it differs, principally, in being much darker beneath, paler above, and of rather larger size.

c. binotatus. Beneath blackish, ventral segments piceous at tip; head and thorax ochreous, the former with two triangular spots between the eyes, the latter with two central subquadrate spots black: each elytron with four series of punctures, a pale suture and margin, the disc irrorate with black dots and tortuous lines; three longitudinal series of spots, and a broad fascia behind the middle, obsolete, black.

Length nine twentieths of an inch.

Specimens three. It is possible that this may be the *irroratus* of Fabricius.

c. lanolatus. Ferruginous; head at base and a vertical spot black; thorax greenish black at base and tip, the black portions dilated and confluent in the middle; elytra greenish black, each with about eight irregular series of deep punctures; external margin, interrupted basal fascia, and three narrow lines pale testaceous: all beneath ferruginous.

Length thirteen fortieths, breadth between six and seven fortieths of an inch.

Sufficiently distinct from *c. venustus*, Say, and *DYTISUS interrogatus* of Fabricius. Specimens six.

c. discolor. Black, minutely and obsoletely granulated. Head with two basal piceous spots; elytra fuscous, margin and base pale, epipleura yellowish; three series of setiferous punctures, which are obsolete behind, on each elytron: ventral segments at tip and feet piceous: nails alike in both sexes.

Length over three tenths of an inch.

Specimens five. Appears to differ from all of the species described by Mr. Say.

c. acuductus. Oblong oval, black, minutely acuducted; head before, two vertical spots, lateral margins of the thorax, and humerus piceous; pectus and feet ferruginous.

Length over five twentieths of an inch.

One individual in the collection of Mr. Oakes. Easily recognised by the numerous short scratches or acuducted impressions.

GENUS HYDROPHUS.

h. fasciatus. Ferruginous, body minutely punctured above, with depressed hairs: antennae blackish at tip; head with a dilated oblique indentation each side in front of the eyes, and a vertical blackish spot; thorax black at tip and base; elytra black, an abbreviated sometimes interrupted fascia near the base, another trimacular behind the middle, and an apical macula ferruginous: postpectus and abdomen at base blackish, punctures dilated, distinct.

Length over three twentieths of an inch.

Four specimens.

GENUS HYPHIDRUS.

h. punctatus. Distinctly and regularly punctured, dull testaceous; head with two dilated frontal impressions; thorax blackish at tip and base; coleoptra fuscous on the disc, with about four obsolete paler maculae on each elytron.

Length over one tenth of an inch.

Specimens twelve. This insect must closely resemble *LACCOPHILUS punctatus*, Say, but cannot belong to that genus.

GENUS HALIPLUS.

h. immaculicollis. Pale ochreous yellow; head and thorax immaculate; each elytron with a dilated basal spot, tip, and suture near it, three submarginal, and two subsutural spots black: The anterior subsutural spot dilated and confluent with the corresponding one on the other elytron: striae with large black punctures.

Length one tenth of an inch.

Variety. Elytra pale yellow, basal spot wanting, central common spot of the coleoptra dilated, triangular, the others less distinct.

Specimens twenty; and of the variety three. Cannot be mistaken for the *12-punctatus* and *triposus*, Say, the former of which is common here.

FOR THE NEW ENGLAND FARMER.

ON THE CULTIVATION OF HYACINTHS, TULIPS, NARCISSUS, &c.

[From Notes taken by an American gentleman while in Holland.]

The proper soil for bulbs, in general, is a light rich soil, mixed with a considerable portion of fine sand; and the compost generally used, is one third fine sand, one sixth rich loam, one third cording and one sixth leaves of trees. The two last to be well rotted, and at least two years old; with this mixture, the beds are formed two feet deep, at least, and raised four or six inches above the level of the garden, to turn off rain. The proper time of planting, is in the months of October and November, though it may answer by the first of December—provided the ground remains sufficiently open.

HYACINTHS may be set six inches apart from each other, and each bulb placed in fine sand and covered with it. After the bed is thus planted, cover the whole carefully with earth four inches. When the winter is fairly set in, (say from the 1st to the 10th of December) then cover with leaves, straw, or sea-weed, four or six inches deep, which should be removed early in spring; a part of it, perhaps as early as the 20th of February, and the remainder during March. With too much protection, the bulbs draw up weak and pale, and are materially injured. During their bloom, it will be proper to support the bells by small sticks, and protect them from heavy rains and the sun. The flower stems should be cut off as soon as they have faded, and the beds left exposed until the leaves are nearly dried, when the bulbs should be taken up, the leaves cut off half an inch from the top of the bulb, and then replaced (sideways) with the fibres on and covered with earth, there to dry gradually for a month; when they are to be taken up, cleaned from the earth and fibres, and each bulb wrapped in a separate paper in a dry place, and frequently aired, or to be packed in dry sand. When wanted for the parlor, they should be planted in September, (if to blow early in the winter) in deep narrow pots, six inches in diameter at the top, and about one third deeper than common flower pots. The soil the same as before mentioned, and the bulb to be just covered by it.—They should not be watered from the top, but the pots should stand, twice a week, in saucers filled with water. Let them have as much air and sun as possible, and not suffer them to feel the direct influence of the fire—for heat forces the stem out before the bells have time to form and acquire vigor and beauty. When the flowers begin to open, give as much water as the earth will imbibe.

To preserve these bulbs, they should, as soon

as the bloom is over, be turned out of the pot with fibres and earth, and put in a prepared bed in the garden, to be treated afterwards as those growing in open ground. By this mode the bulbs will not be materially injured, and will blow well the second year. Whereas those grown on glasses or forced are seldom good for any thing afterwards.

SINGLE HYACINTHS are preferable to most double ones for early flowering in winter; being two or three weeks sooner in bloom. Their colors are more brilliant and the bells more numerous than the double.

TULIPS are hardier than the hyacinth, and in open ground may be planted four inches apart, covered two or three inches with earth.

The **POLYANTHUS NARCISSUS** should be planted six inches deep and eight inches apart, and carefully protected from frost, being the most tender of the bulbs. Unless taken up after bloom, it will grow in the autumn and suffer during winter.

Depth and distances. Hyacinths, amaryllis, martagon, and other large lilies, and peonies, should be planted at the depth of four inches; crown imperials, and polyanthus narcissus, five inches; tulips, double narcissus, jonquilles, colchicums and snow-flakes, three inches; bulbous irises, crocuses, arums, small fritellarias, tiger flowers, gladiolus, and snow-drops, two inches; ranunculus, anemones, oxalis, and dog's-tooth violets, one inch; always measuring from the top of the bulb. The rows should be about ten inches apart, and the roots be placed from four to six inches apart in the rows, according to their size.

Method to bloom hyacinths and other bulbs in the winter season, in pots or glasses. For this purpose, single hyacinths, and such as are designated earliest among the double, are to be preferred. Single hyacinths are generally held in less estimation than double ones; their colors, however, are more vivid, and their bells, though smaller, are more numerous. Some of the finer sorts are exquisitely beautiful; they are preferable for flowering in winter to most of the double ones, as they bloom two or three weeks earlier, and are very sweet scented. Roman narcissus, double jonquilles, polyanthus narcissus, double narcissus, and crocuses, also make a fine appearance in the parlor during the winter. It is a remarkable circumstance of the crocus, that it keeps its petals expanded during a tolerably bright candle or lamp light, in the same way as it does during the light of the sun. If the candle be removed, the crocuses close their petals, as they do in the garden when a cloud obscures the sun; and when the artificial light is restored, they open again, as they do with the return of the direct solar rays.

Hyacinths intended for glasses should be placed in them about the middle of November, the glasses being previously filled with pure water, so that the bottom of the bulb may just touch the water; then place them for the first ten days in a dark room, to promote the shooting of the roots, after which expose them to the light and sun as much as possible. They will blow, however, without any sun; but the colors of the flowers will be inferior. The water should be changed as it becomes impure; draw the roots entirely out of the glasses, rinse off the fibres in clean water, and the glasses well washed inside; care should be taken not to suffer the water to freeze, as it not only bursts the glasses, but often causes the fibres to decay. Whether the water be hard or soft is of no great consequence; but soft or rain water

is considered preferable, but it must be perfectly clear. Forced bulbs are seldom good for any thing afterwards.

Nosegays should have the water in which their ends are inserted changed, on the same principle as bulbous roots; and a much faded nosegay, or one dried up, may often be recovered for a time, by covering with a glass bell, or cap, or by substituting warm water for cold.

LONG ANGLO-MERINO WOOL.

The British Society for encouragement of arts, manufactures and commerce, have awarded a premium to Charles Callis Western, Esq. M. P. for a specimen of long fine Anglo-Merino Wool.

In a communication to the Society, Mr Western thus describes a sample of this wool;—"The wool will be of three years' growth next clipping time; I took it off this morning from the backs of two wether sheep. I drew it from the skin with quite as much difficulty, as if it had been of one year's growth, and with as much pain to the animals. You will observe the strength and elasticity of the wool, and the impossibility of discovering any difference in each successive year's growth. I estimate the weight of one fleece at 25 lbs.; the other at 28 or 30 lbs. in the grease.

The food of the sheep has been according to the season, tares, and clover, green grass, hay, turnips, mangel-wurtzel, and oats. Weight of the sheep alive, 239 lbs.; another 244 lbs.; dead one 158 lbs.; the other 149.

I am more and more convinced, I am right in the object at which I aim, that of the growing long, fine, strong Merino wool for combing. I am satisfied it is practicable, that the farmer who applies his attention and skill to this subject, will find an adequate return in the sale of wool and mutton.

Mr Western says in a subsequent communication,

"The principal object that I had in view was to make known the curious fact, that the animal (Anglo-Merino sheep) will carry its fleece in all its strength and beauty three years. I have produced the article such as was never seen or contemplated before, most people supposing that sheep shed their fleeces every year.

I do not propose the wool should be more than two years' growth which would require one year's cutting. The sheep should be wethers, and put up at about 16 or 18 months old."

TO KINDLE A COAL FIRE.

Let the stove or grate be empty or nearly so; put in a few blocks of dry wood, or a handful or two of charcoal, in the bottom, set fire to these and cover them over with lumps of coal about the size of a walnut; shut the stove door, or put up the blower, and in five minutes the whole will be ignited, when the stove or grate is to be filled up with coal. If the grate is of a proper size, and the draft properly regulated, a supply of coal every twelve hours will keep the fire from going out from one year's end to the other. No person need unless he chooses, let his fire go out more than once in a year.

We will take this opportunity of correcting an error, which seems to be generally entertained, that our coal requires a very powerful draught to keep it in a state of ignition. After it is once ignited, nearly the reverse is the fact. It requires a quick draught at first until the fire is lighted,

that is if you are in haste to have the room warm, but not otherwise, and then the draught necessary to ignite a wood fire is amply sufficient for one made of anthracite coal. There ought to be some mode of quickening the draught in every convenience for using stove coal; for the facility of speedily kindling and increasing the fire. But when the fire is once ignited, no more draught ought to be applied to it than will keep the coal in lively combustion. There are but few chimneys which have not more draught than is necessary. One other matter ought to be observed; the bottom of the grate should not be more than four or five inches from the floor.—*Miner's Journal.*

NEW YORK INSTITUTE.

We understand that the expected Mulberry Seed, which this Institute intend to distribute, gratuitously, for the culture of the white Mulberry, the leaves of which, used as food, insure from Silk Worms the fairest silk, has been received from France. We believe it is intended to call a meeting of the Institute, to furnish instructions of an ample kind for their efficient cultivation, and to take immediate and energetic measures to insure a handsome crop of "seedlings" in the spring, so as to interest agriculturists in this country generally in management of *Silk Worms*.—*N. Y. Statesman.*

A new and valuable invention.—We have before us specimens of paper manufactured from straw, or hay, which are worthy of examination, not only as a matter of curiosity, but as the evidence of a most valuable improvement in the arts. The inventor of the process which is applied chemically, is Col. Wm. Magaw, an ingenious and respectable citizen of Meadville, Penn.

He has produced these specimens from partial trials, but he is now erecting works for an extensive manufacture of paper from this material. The paper already produced, is wrapping and paste-board, which is of a good quality; but we understand that it will not be confined to the coarser kinds. The advantage of the improvement to consumers, may be estimated from the single fact that it reduces the price more than one half, the qualities being equal.—*Albany Argus.*

The administration of Indian Affairs is about to undergo a salutary reform. Governors Clark and Cass are directed by the Secretary of War, to prepare a report on the subject, to be submitted to Congress. From their intelligence and experience on matters connected with the subject, a valuable and able public document may be anticipated.

The rudeness of Dr. Parr to ladies was sometimes extreme. To a lady who had ventured to oppose him with more warmth of temper than cogeny of reasoning, and who afterwards apologised for herself by saying, "that it is the privilege of women to talk nonsense." "No madam," replied Dr. Parr, "it is not the privilege, but their infirmity. Ducks would walk if they could; but nature suffers them only to waddle."

An idea prevails, that animal food is indispensable to sustain the vigor of the body. A London coal-heaver must have his ale and beef. An Arab carries his load across the desert, and lives on dates and milk, or bread and oil; he runs faster, and lives longer on this simple diet than your beef-eaters.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, DEC. 12, 1828.

FIRE PLACES.

An open heart and a liberal hand are much better than an open house and a large fire place.—New England fire places, and other contrivances for warming apartments, are not, generally speaking, indications of superior skill in the useful arts, nor evidence of paramount acquisitions in the details of practical philosophy. One would think that the warmth generated by the combustion of wood, or other fuel was considered as a nuisance, and that the principal objects of our culinary fires were to heat the atmosphere, and bring on such a thaw as would soonest break up the sleighing. In pursuance of this plan, we (that is, some of us) stick our stoves in the throat of our chimneys, and turn the heat out of doors with all practicable expedition. In lieu of all this, we advise you to have a good deal of stove plate and pipe in your rooms which you wish to warm, and let the pipe go round and round till it has distributed all the heat it is capable of receiving, in the apartment, instead of conducting it to the open air by the shortest possible route.

LARGE CATTLE and LIBERAL PREMIUMS.

John L. Boylston, Esq. of Princeton, Mass. exhibited at the last cattle show at Brighton, cattle of the following description, among others:

One pair of two years old steers of the Holderness breed, which weighed 2,254 lbs.
One bull, only 14 months old, which obtained the first premium in 1826, weighed 1,014 lbs.

The amount of premiums, which have been awarded to the above named gentleman this year, for his fine stock exhibited at Worcester and Brighton, including his premium for butter is 174.20 dollars.

DRILL HUSBANDRY, or ROW CULTURE.

Much has been said and written in favor of drill or row husbandry, for grain and grass as well as Indian corn, potatoes, &c. In this kind of culture, wheat, barley, and oats are planted like peas and beans, (in rows) and the soil tilled with the plough, horse hoe, or hand hoe, while the plants are growing. It was introduced into England by Jethro Tull, who wrote largely and repeatedly on the subject. Dr. Deane, however, in his *New England Farmer*, stated his doubts, whether that sort of culture would prove profitable in this country; [see article, *New Husbandry*—Wells & Lilly's edit.] and the writer of the article *Agriculture*, in the *Edinburgh Encyclopedia*, states his opinion of drill culture as applicable to Great Britain in the following terms:

"The culmiferous grains of wheat, barley, oats, and rye may be raised more abundantly, and at less expense, according to the old fashioned, or broad east system, than by what is called the row husbandry. When these grains are drilled, they are greatly exposed to the weather, and liable to be hushed and broken down by every wind.—They also tiller or stool [branch out] so long as any interval remains for the spreading of their roots, which occasions an inequality in the ripening of the grain of considerable importance to the manufacturer. From these circumstances we are led to believe, that the row husbandry cannot be profitably exercised with any of the culmiferous

varieties [such as wheat, rye, barley, oats, &c.]—though with the leguminous ones of beans, turnips, potatoes, &c. (plants which probably derive a large portion of nourishment from the air, or at least cannot be cultivated to advantage where a free circulation of air is wanting) the row husbandry is not only beneficial in the first instance, but of important use towards cleaning the ground, and preserving it in good condition afterwards.

Bref. Market Day.—A gentleman from Vermont has made a suggestion, that the purchase day for beef cattle at Brighton, should be changed from *Monday to Wednesday*. This arrangement would make a saving of expense to those drovers who conscientiously observe the Sabbath.

FOR THE NEW ENGLAND FARMER.

CRAB AND APPLE HEDGES.

MR. EDITOR.—I have long been a reader of your useful paper, and have repeatedly enjoyed the *Yankee's privilege* of asking questions through this medium. Permit me to ask if the apple tree is known to be in use to any considerable extent, as a substitute for the thorn for hedges? And, whether it may not serve the same purpose as the thorn, and at less expense?

An answer to the above would be gratefully received by your obedient servant,

E. F. WOODWARD.

Newton, December 10, 1828.

By the Editor. European writers have recommended crab trees and apple trees as suitable for hedges; and McMahon says "the common wild thorn crab will make an excellent ground, or ditch hedge, and will thrive in a poorer soil than the thorn; and hedges raised from the pippins of apples do tolerably well and form strong fences;—the former is raised from the pippins, and the latter can be propagated in abundance by sowing the punice *very thick* immediately after being pressed for cider, on a bed of good ground properly prepared, and covering the whole with fine light earth) near an inch deep; a few plants will appear soon after sowing, but a great crop will come up in the spring, which may afterwards be used for stocks to graft on, and also for hedges, where more suitable kinds cannot be had."

Birch, beech, poplar, alder, locust, cedar, hemlock, and many other kinds of wood have been used for hedges, as well as the crab tree, and apple tree. They all have their advantages and disadvantages, and the nature of the soil should be taken into consideration in the choice of hedge plants. We have never seen a hedge of apple tree or crab tree plants, but both have been often recommended by writers on agriculture. They would, however, in this country, be liable to some incidents which a cultivator should take into consideration before he attempts to make live fences of such materials. The borer, the caterpillar, and the canker worm are to be guarded against in hedges composed of apple or crab trees. The plants must be pruned, plashed, &c. and would require a good deal of clipping in order to make them present such a barrier of limbs that cattle and especially hogs, might not crowd through them. On the other hand their fruit, and their wood, valuable in the hands of the turner, as well as for fuel would afford compensation for considerable extra trouble and expense. Our present impressions on the subject of plants for hedges are

in favor of the buckthorn, (*Rhamnus catharticus*) which has been successfully cultivated for that purpose, by E. H. Derby, Esq. of Salem, Mass.—See *New American Gardener*, page 56.

The prime principles of agriculture.—1st. The soil ought to be kept dry; or, in other words free from all superfluous moisture. 2d. The soil ought to be kept clean, in other words free from noxious weeds. 3d. The soil ought to be kept rich; or in other words, every particle of manure, which can be collected to be applied, so that the soil may be preserved in a state capable of yielding good crops. An agricultural code of this kind is not only a true one, but has the particular merit of being simple and distinct, and may be understood by the dullest capacity. Were it carried into execution—were the operations of farmers regulated by its tenets—were their endeavors constantly directed to keep the land in their possession dry and clean, and as rich as possible, then the country would be progressively improving. These are the fundamental principles of agriculture, though several other things, such as rotations of crops and the like, may be regarded as minor or inferior

SALIVATION OF HORSES.

C. S. Rafinesque, Prof. of Botany and Natural History in Transylvania, in a communication published in the *American Farmer*, says, that "two kinds of weeds, which grow occasionally in meadows and pastures, produce this disorder whenever they are accidentally eaten by horses and cattle, together with clover or grass. Sheep and hogs never eat them. The first and the worst is the *Euphorbia hypericifolia*, a small milky plant with opposite smooth leaves and very small white flowers. The second is the *Lobelia inflata*, or asthma weed, a larger plant, with alternate hairy leaves, blue flowers, and swelled seed vessels.—Both have the leaves ovate, oblong, and slightly toothed.

"They both blossom at the end of the summer, when of course they are largest and most detrimental. Being mixed with the second growth of clover and grass, they sometimes become entangled thereto, and are eaten by horses, who would probably reject them otherwise. They may likewise become mixed with the second crop of hay, and be eaten with it by horses. Hence has arisen the vulgar opinion which ascribed this disorder to the second growth of clover.

"Both the above plants have energetic properties. All the species of the genus *Euphorbia* are strong drastics, and the *Lobelia inflata* is little inferior to said genus in energy; it has been usefully employed in the cure of asthma and other disorders; it was one of the Indian medical plants. They produce a slight salivation even in man.

"Some other plants may have similar salivating properties, but the two above mentioned are the most common, being found almost all over the United States. They are not uncommon in Kentucky.

"By attending to this, it will be easy to prevent the disease, since they are both annual plants, which may easily be destroyed in the meadows by pulling them up before they ripen their seeds. Should they grow too thick, horses and cattle should not be allowed to pasture where they grow, and the second crop of hay should be cut rather early (when the weeds are in blossom) and burnt on the ground.

"Should the horses and cattle happen to eat

them notwithstanding, and be attacked with the salivation, they may be cured in a single day by feeding them plentifully with cabbage leaves—which appears to be an effectual antidote against this peculiar disorder.

"If no cabbages should be at hand, the leaves of turnips, radishes, mustard and such other plants of the cruciferous tribe, might probably answer as well.

"I venture to hint that cabbages, and the cruciferous plants might, perhaps, become an efficacious remedy in the morbid salivation brought on man by an excessive use of mercurial preparations, tobacco, &c. It is by similar analogies that the *materia medica* is often enlarged, and effectual remedies are destroyed or succedaneous palliatives adopted."

OPIUM.

The Opium of commerce is prepared from the *Papaver somniferum*, or white poppy, so named from the whiteness of its seeds. Opium is merely the milky juice of the plant inspissated, and blackened by drying. It is obtained by making incisions in the capsules every evening, and in the morning the sap, which has distilled from the wound, and become thickened, is scraped off, and being afterwards worked by the hand in the sunshine, is formed into cakes of about four pounds weight each. The quantity of this drug used for medical and other purposes is immense. Six hundred thousand pounds are said to be annually exported from the Ganges alone.—*Drummond's First Steps to Botany*.

Candles and oil.—Formerly when candles were high and oil low, the latter was considered the cheapest light. At the present time candles are ten cents for diphs, and eleven for moulds;—and oil is dear. Tallow light is now considered the cheapest.

Perkins' Plates.—No better evidence can be required, that the monied interest approve of Perkins' Bank bills, than the fact that Major A. Perkins has printed for 127 banks, the bills of which have never, in a single instance, been successfully counterfeited.

FINE VEGETABLES.

MR RUSSELL—

In the Farmer of Oct. 24th, I noticed an account of a crooked neck Squash, raised in Salem, which weighed between 40 and 41 lbs.; also another raised in Taunton, which weighed 34 lbs. *Kennebec beats them both*. I have a crooked neck Squash, raised in this town, from seed purchased at your office, which weighs now *fifty-five* lbs. It measures from the centre of the stem to the centre of the blossom, 5 feet 2 1-2 inches. Its measure around the largest part, 2 feet 6 1-2 inches; at the smallest 21 1-2 inches. It was taken from the vines 3 weeks since, and the man of whom I bought it, said it then weighed 60 lbs. The correctness of this I cannot vouch for, but I am certain it now weighs by Dearborn's balances 55 lbs. good weight.

Hallowell, Nov. 29, 1823.

Yours, &c.
F. GLAZIER.

TOMATOS.

I was very glad to see the articles on cooking Tomatos, in the Farmer of the 31st of Oct.; but neither of them is exactly what I want. I wish to see a recipe for cooking them as I have seen them on the table in Philadelphia and Boston. I think they call it *Tomato Sauce*. As near as I can recollect it was of about the consistency of boiled squash, and eaten in the same way. I should think the skin only was taken off, and mashed up with the seeds in. Whether it was boiled or stewed, and how, is what I wish to know. It is too late for this year, but I should like to see such a recipe before they are in season again. I raised some of the first Tomatos from the seed I had of you, last spring, that were ever seen here. I made some catsup of them by a recipe in vol. vi. of the Farmer, which I prefer to any catsup I ever bought.

[P] We shall feel under obligation to any person, who will furnish us with an article on the various modes of cooking this wholesome vegetable, which is now coming into general use.

EDITOR.

ADVANTAGES OF THOROUGH CULTIVATION.

That more is to be gained by cultivating a small spot of ground well, than a large parcel indifferently, is a truth illustrated by the following apologue from a Roman author:

A vine dresser had two daughters and a vineyard; when his eldest daughter was married he gave her a third of his vineyard for a portion; notwithstanding which he had the same quantity of fruit as formerly. When his youngest daughter was married he gave her the half of what remained, and still the produce of his vineyard was undiminished. Columella lib. iv. cap. 3. Pliny mentions a freedman, who having much larger crops than his neighbors, was accused of witchcraft, and brought to trial. He produced in the forum a stout daughter, and some excellently constructed iron farming tools, with his oxen, and said "These, Romans, are my charms." He was acquitted.—*Pliny's Nat. His.* xviii. 6.

About 326 cargoes of lumber arrived at Providence from Maine in the season of 1827. This article is carried into the very interior of Massachusetts on the Worcester canal. It was no unjust observation to say, that the Worcester canal has completely tapped the heart of that state.—*Noah's Inquirer*.

The Morris Canal proves of great advantage to New Jersey. Dover, a little manufacturing village of 20 houses, pays indirectly and directly \$7000 a year, for the transportation of articles which must pass the canal, when finished.

A writer in the American Farmer has suggested the propriety and utility of digging a canal from Buffalo to Detroit, along the shore of the lakes.—He says it would afford a cheaper transportation than the navigation of lake Erie now gives.

Four years ago, eight counties in Pennsylvania, sent down the Susquehanna in one season, \$23,000 bushels of wheat, 18,500 of clover seed, 10,350 barrels of whiskey, besides much pork. The trade is doubled since that time.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for—For sale by the lb. or ounce. Shallops for fall planting. Tree and Potato Onions.

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the *Rheum Undulatum*, or Tart Rhubarb, or Pie-Plant, an excellent article for summer use. (See N. E. Farmer, vol. vi. page 290, and page 11 of this volume, and Fessenden's New American Gardener, article *Rhubarb*, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts. per root.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.

Orchard Grass Seed.

A few more bushels of this valuable Grass Seed, growth of 1823. Also, Lucerne, White Clover, Fowl Meadow, and every other kind of Grass cultivated in New England.

Seed Potatoes.

A few bushels La Plata or Long Red Potatoes, raised by Mr Gourgas of Weston; selected for seed, of a uniform size, and much improved as to their earliness, by the careful attention of Mr G. For sale at the

New England Farmer Seed Store,
No. 52 North Market, Street—Boston.

Gunpowder, &c.

Du Pont's Gun Powder, at 23 to 50 cts. per pound Shot Balls Flints and Percussion Caps.

Also, Alum Refined Salt Petre Blue Vitriol, &c. constantly for sale at the *Dupont Powder Store*, No. 65 Broad street—By E. COPELAND, Jr.

[P] The Du Pont sold as above, is warranted first quality—and is marked "E. Copeland, jr. Boston," on the head of the cask
March 14

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$1 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Field Peas.

A consignment of 50 bushels of Field Peas, from Vermont, of the growth of 1827, in good order. They will be sold by the tierce at \$1.75 per bushel.

Out Meal, &c.

Fine Out meal and Out Flour, Hulled Oats, Hulled Barley, Barley Flour, &c. for sale by the barrel or less quantity, direct from Stevens' Mills, Vermont.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts. a paper. They were gathered by a gentleman, familiarly acquainted with the sorts, expressly for us. They will be sold by the single paper or packed to order, in any quantity. Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

MISCELLANIES.

From the New Bedford Mercury.

INDIAN ANTIQUITIES.

MESSRS. EDITORS.—In the prosecution of the labor pursued on the farm of Mr. ROUMAN in the construction of a mill dam and race, the workmen have exhumed many skeletons of the aboriginal inhabitants of our land. They are found in little groups, over a wide extent, at considerable distances, from each other, and buried in different positions. The ground is near the shore, and from the immense quantities of shells that cover it, must have been, at a former period, a favorite resort for the wandering children of the forest, to collect the food which at their short seasons formed their principal support.

During these visitations, the lot of humanity has overtaken many, and their relics of mortality have been deposited on the spot which witnessed their separation from their tribes. If there ever were, any external evidences of this place of sepulture, they have long since been levelled with the adjacent surface; for the spot being on high gravelly land, agreeably to the custom of our Ancestors, was the first in the neighborhood to claim the honors of the plough and the sickle: and has been gleaned until exhausted nature refused her wonted products. That there was a difference in the rank which these silent memorials of ages gone by, held among their cotemporaries, is indicated by the care which they seem to have excited in the last offices performed for them. Some were found in a sitting posture; others lying horizontally, with their heads towards the setting sun; some, without any accompanying tokens of respect, while others seem to have claimed uncommon honor. I have before me, a skull and jaw bone, with several of the vertebrae, which appear to have belonged to a hereulean frame, in a state of comparative preservation. The less durable relics crumbled to dust, on being exposed to the air. By their side were found a pipe well filled with decayed tobacco, several spoons, ear rings and chains of minute size, of copper, carefully wrapped in the skin of some beast, no doubt originally forming the pouch of the owner, together with cloth, the threads of which are manifest.—And with the same care, the bones of a small animal, some of which resemble the head of a tortoise, are preserved.

From the appearance of the teeth, their possessor must have lived to old age; and perhaps was of the race whom "Uncas" describes when he says, "once we slept where we could hear the salt lake speak in its anger;—then were we rulers and Sagamores in the land."

Seldom compute a man's wealth by his mode of living, dress, or the company he keeps.

If a man cannot pick up knowledge enough of the world in a year to satisfy him, he may in an hour discover enough to sicken him.

When silence is the trick of villany, it operates as fatally as slander or reproach.

Where there is too much anxiety required to keep a treasure, there possession is a curse.

Contemn riches, and thou shalt be rich; contemn glory, and thou shalt be glorious; contemn thy enemies, and thou shalt overcome them; contemn slothfulness, and thou shalt enjoy rest and quietness.

If you have no principles, you can have no character; acting in conformity to certain well digested rules, proves principle; the exercise of principle constitutes character.

He who bears and forbears, will always be a valuable member of society, whatever may be his situation in life.

Man discerneth another's faults easily, but his own very badly, because in another's case his heart is quiet; in his own case, troubled, and a troubled heart cannot consider what is good.

Deacon Solomon Slow.—Deacon Slow had three sons who were, as Deacons sons are apt to be, very roguish. They were in the habit of poking fun at an old ram, who endeavored to make his share of the sport by butting them over, a kind of fun which he often manifested a disposition to play off upon the Deacon as he marched down to salt the flock. The Deacon's sheep-pasture was upon the Shawshoen river, which is narrow but deep, and the pasture terminated in a precipice which is 15 feet above the water: the boys after they had exhausted all other fun upon the ram, were in the habit now and then of squatting on the edge of the precipice, and darting a hat at him, upon which he would come with blind fury thereat. The boy who held the hat, could easily leap aside, and the exasperated ram was quickly cooled by a plunge headlong down the precipice, into the stream.—At this trick they were one day caught by the Deacon, their father, who took them into a thicket close by and anointed their backs thoroughly with the oil of birch—an excellent application in such cases made and provided. It is not always effectual, however, and in this case the disease was not cured; the boys were a few days after waiting round the place in order to repeat the joke, but on beholding their father coming at a distance with his basket of salt, they hid in a thicket. Slowly came Deacon Solomon Slow, and after he had scattered his salt, he stood upright, and thought within himself, that it would be amusing to see the ram bolt over the precipice into the river. He saw no one nigh, and taking off his broad brimmed hat, he made demonstrations, which at once attracted the notice of the lord of the flock, who set out as usual in full speed. The Deacon had squatted close to the edge—and, as he saw the ram bounding along, he pictured to himself the ridiculous figure the silly sheep would make bounding with a splash into the water—he began to smile but in the midst of his delight at the ram's ridiculous appearance, he forgot to jump aside, and the beast butted him off with a splash into that water where he meant the silly sheep should have gone. The boys ran out clapping their hands "you've got it, dad!"—"you've got it, dad!" in all the ecstasy of revenge. Deacon Solomon Slow, crawled out from his bath with a visage longer than he had ever worn before.—*Galaxy.*

One of the most powerful causes of natural poverty seems to be gradually removing from society and falling into disuse—the practice of making ardent spirits a common daily drink in families.—No man accumulates a fortune without paying particular attention to *little gains*—and the experience of thousands can testify that poverty may come by *little losses*. It availed but little how hard many of our farmers labored, or how meantly clothed they went; the dram bottle sprung a leak, and each drop went to make up a drop of gold. Men,

whose eyes would have glistened with perfect content, if they could have laid up one hundred dollars a year from the gain of their husbandry, have spent two hundred for moisture, and found themselves still dry at the end of the season. Remove this evil entirely, and the united streams of increased gain, accumulating from every family in the middle and lower walks of life, will swell to a river of plenty.—*Boston Palladium.*

The Dedham paper states that in every case of criminal conviction, at the late term of the S. J. Court in that place, the convict was under the influence of ardent spirits when the crime was committed.

Great sale of Wool.

ON THURSDAY, DECEMBER 12, AT 10 O'CLOCK,
At the Hall over the New Market

219 bales Saxony WOOL, consisting of first and second Electoral—first and second Prima, Secunda, and Tertia.
246 bags Leonessa Soriana Segoviana Spanish Wool.
130 bags Portuguese Wool.
180 bags (about 76,000 pounds) American Fleece Wool, among which are some choice lots of selected Saxony and full blood Merino fleeces.

Catalogues will be ready for delivery and the Wool may be examined three days before the sale.

Coollidge, Poor & Head—Auctioneers.

MUNROE & FRANCIS have just published the 2d edition of the House Servants' Directory, or a Monitor for Private Families; comprising hints on the arrangement and performance of Servant's Work, with general rules for setting out Tables and Sideboards in first order. The art of Waiting in all its branches; and likewise how to conduct Large and Small Parties with order; with general directions for placing on Table all kinds of Joints, Fish, Fowl, &c. &c. Nov. 28.

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr. Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordeaux, Clerac, and Bazet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1828.

Mr. A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to, the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 1000; and 18 cents for less than 50 roots. Payment to be made on delivery of the roots. Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 35 Wall street; Boston, E. Copeland, Jr.—Albany, R. McMichael—Philadelphia, Van Auringer—Baltimore, Willard Rhoads—Washington City, Wm. Pairo. Richmond, Davenport, Allen & Co. Savannah, Hall, Shapter & Tupper—New Orleans, Foster & Hutten. Charleston, (S. C.) J. & J. Street Co. Mr. A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal booksellers of the United States; and his agents will furnish them gratis to subscribers. (D12.)

MUNROE & FRANCIS have just published the 2d edition of a work called *Seventy-Five Receipts for making Pastry, Cakes, and Sweetmeats*. By a lady of Philadelphia. With a series of miscellaneous receipts for Dishes in use at Supper Parties; also, a complete list of weights and measures, whereby weight can be ascertained by measure.

Winter Keeping for Horses in the vicinity of Boston,

Where the most faithful care may be relied on, may be had on application to Major Samuel Jaques, Charlestown, or Mr. T. J. Niles, School Street, or to Mr. Russell, Publisher of the New England Farmer. An early application is desirable.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

HORTICULTURE.

FOR THE NEW ENGLAND FARMER.

ON THE INSECTS THAT INJURE THE APPLE TREE.

MR PEsSENDEN—Pardon me for saying, that your exposition in the Farmer of the 5th, relative to the *Coccus*, or *American blight*, is not perfectly understood by myself, and I fear not by other of your readers. Your Pennsylvania correspondent asks information relative to an insect "about the size and shape of a small grain of coffee, found on the body of the apple tree. The plant lice described by Mr PERLEY, are "in form like half a kernel of rye, but not more than a twentieth part as large, with the flat side sticking to the smooth bark of the tree." Do these gentlemen refer to the same insect? And is this the insect described in your quotation from Kirby & Spence? I think not.* I noted Mr PERLEY's communication with deep interest, on its publication in your first volume, as many of my young apple trees were then suffering from the lice he described, and some had been apparently killed by their depredations. They were abundant not only on the smooth bark on the exterior, but on that which had formed under the rough bark that had partially peeled from the trunk. I profited by Mr PERLEY's suggestions, and subsequently by those of Mr WHEELER, and applied strong lye with a brush, in June, with very great benefit, sometimes with, and at other times without, the addition of lime. I doubt not but strong brine would be equally fatal to the insect, but I was fearful it might become injurious to the trees, having lost

* We believe that our Pennsylvania correspondent, in his communication, published page 142 of the current vol. of N. E. Farmer, meant to describe two distinct kinds of insects, one of which we thought might be the same with that mentioned by Mr PERLEY.

Our Pennsylvania friend says (page 142) "the appearance [of the insect] to me resembled the blossoms of Timothy, or some small grass, shaken on the trunk of the tree, when wet with dew, and remaining on it. After which they increased in size to about the bigness of shot No. 8 cut in two, and a little lengthened; and formed a cover adhering to the bark, under which the insect, whatever it may be, was found."

Again, in the same page, he speaks of the insect, (which may be the same, but we should suppose, from the description that it was of a different species) which was "dark coloured, on the body of the tree, about the size and shape of a small grain of coffee with a bristly coat," &c. We can hardly suppose that both these descriptions apply to the same insect, though from the manner in which the last mentioned is introduced by our correspondent, one would be led to suppose that he considered them to be the same. We, therefore, gave (page 153) Mr PERLEY's description of lice on apple trees, and observed that "The above description of a destructive insect, and the remedy prescribed by Mr PERLEY may be of use, although the insect may not be the same with that which has annoyed the fruit trees of our correspondent." The appearance which "resembled the blossoms of Timothy" of "M." might be the "white animalcule resembling a louse, so small they are hardly perceptible to the naked eye" of Mr PERLEY. But it seems improbable that "the cover adhering to the bark under which the insect was found" would have been the same with the "bristly coat," mentioned by "M." in another part of his communication. But insects present appearances so totally different in their changes from the egg to the larva, pupa and perfect state that none but a skillful entomologist can always detect them in their different disguises. It fortunately happens, however, that the same remedies are efficacious against all or nearly all the species, and we have no doubt but either a solution of salt, as recommended by Mr PERLEY, a solution of potash, as prescribed by Mr WHEELER, or spirit of tar, as used by Mr JOSEPH BANKS, would prove equally efficacious against most or all those insects which infest the bark, leaves, stems or fruit of fruit trees, whether they are or should be considered as belonging to the tribes of the *Aphis*, *Coccus*, *Tinea*, &c.—EDITOR N. E. FARMER.

several trees by the corrosive effects of salt, which was contained in damaged fish applied to my orchard.

There is another insect which is seriously injurious to the apple tree, which seems particularly to be the dread of European nurserymen and orchardists. It is called, by London, Salisbury, and other horticultural writers, the *Aphis Larata*, or *American Blight*, but for what reason this last term is applied to it, no one has satisfactorily explained. Salisbury has figured it, in its different states, as it appears under a magnifying power, upon a branch and root of an apple tree. It is decidedly different from the plant louse described by Mr PERLEY. The eggs, which cannot be distinguished but with the assistance of a microscope, are deposited in a white cotton-like substance, in which the insect is enveloped, generally at the insertion of small branches, in the chinks of the bark, or at the surface of the ground, especially if there are suckers coming from that point.—Wherever the nursery lodgment is made, warts or protuberances ensue. They are small and indurated upon the stock, but upon the roots are often in bunches or large masses. I have seen like appearances upon shrubs and plants in the fields and forests, but never gave them a particular examination.* This, I apprehend, is the *Coccus*, or *American Blight*, described by Kirby & Spence, and is different from that described by Mr PERLEY. We have for two seasons followed the directions found in London's Gardener's Magazine, in the Albany Nursery, for the destruction of this aphid, by applying oil to their nests, if I may so call the mouldy-like substance in which they are usually enveloped. As these were often found in the incision where a bud had been inserted a few weeks before, we had apprehensions that the application would prove detrimental; but this was not the case. We succeeded, with considerable labor in nearly extirpating them from the stocks in our nursery. Most of the plant lice, I believe, belong to the genus *Aphis*. They are troublesome on the peach, cabbage, &c. and are endowed with singular properties of propagation, by which they multiply with incredible rapidity.

Before I close this communication, permit me to express my regret that your "New Correspondent" has not thought fit to give us either his name or the title of the "works" in which he has read "a minute description" of the diseases which now affect our pear and plum trees. That "minute description," must advise us of the causes, as well as suggest the cures. The gentleman should not hide his light under a bushel; and I, for one, should feel particularly obliged if he would let it shine upon us. Venerating, like him, the writers of "some eighty or ninety years ago," I have carefully examined Philip Miller, as well as more modern works, but can find nothing in any of them like the diseases which we have under consideration. But let us not misapprehend each other. I consider the disease of the apple

* This insect is also described and figured by London, Gard. Mag. p. 702. The remedy he prescribes is "Thoroughly cleaning with a brush and water, together with amputation when it has been some time at work." This he says is "the only means of destroying this insect; but even this will not do, unless resorted to at an early stage of the process."—EDITOR.

and pear, now pervading the country, different and distinct from the fire blight of Europe—that it is confined to no soil—limited to no particular varieties, and confined to no aspect. Your correspondent says, this evil does not arise in light sandy soils, not heavily manured. My soils are precisely of this kind. It first appeared in them in 1827, upon more than 100 trees, and upon grounds which had received no manure for years. In terming these new diseases I have followed the example of others. I was first acquainted with them in 1822, at Kingston, and have marked their progress northward and westward from that date. During the last season I have visited several districts where they are both yet unknown. I mentioned the Hessian fly, as an instance of new insects coming among us. I might add the bee miller and the locust borer.

Your "New Correspondent," in suggesting the soils adapted to different fruits, assigns to the St. Germain pear, one that is rich. I beg leave to qualify this, by adding to rich, in the language of Miller, Loudon, Cox and others, *warm and dry*.—All cultivated fruits, I believe, like a rich soil; though the fruit of many varieties attain to higher perfection upon a soil that is warm and dry, or in other words upon sands, gravels, &c. Among these are the golden pippin, winesap and other apples, the St. Germain pear, and I think the peach. The juices are more concocted and higher flavored, on dry, light grounds, though the volume of pulp is less. Miller says, that in a moist situation the juice of the St. Germain pear is apt to be harsh and austere. The experience of my neighborhood shows it. Again—he says the Vergaleu requires a rich and the St. Michael a gravelly soil. I believe the Vergaleu of our nurseries is the St. Michael or Doyenne. The Vergaleu of Europe is advertised with us under the name of winter Vergaleu, Ice pear, or Poire de Glasse, or Chambrette. The first is in eating in September; the latter in November and December.

Albany Nursery, Dec. 7, 1828. J. BUEL.

QUINCE STOCKS FOR PEARS.

An article on this subject has lately been published in "Transactions of the London Horticultural Society," by Thomas Torbror, F. H. S. &c.—The writer observes that "working the best kinds of pears on quince stocks is an old, though not a generally enough adopted custom. The effects of such a union are universally known; but no one, perhaps, could have imagined that the difference in the fertility of quince and free stocks, could have been so much as is shown by Mr Torbror's comparison. In a careful estimate of produce, by measure and tale, as well as by space on the wall, he states that the Gansell's Bergamot, on the quince, yielded at the rate of 15.1 to 1; the Brown Beurré 4.4 to 1; the Crassane, 8.2 to 1; and the Colmar, 2.8 to 1; together averaging about 7.6 to 1 in favor of the quince stocks. "Such a result deserves the attention of nurserymen and the owners of small gardens. It is to be regretted that the trial was not made from trees of the same age and condition; those on quince stocks being from maiden trees planted in 1818-20, and those on free stocks from very old trees, cut down in the same years, but which had quite

recovered their luxuriance and fruitfulness. To this paper a note is prefixed by Alexander Seton, Esq. F. H. S. with a view to call the attention of persons to the same object, stating that he thinks pears grafted on quince stocks are better adapted for stiff clayey or loamy soils than those on free stocks, and recommending this choice to planters located on such soils.

There are, however, some disadvantages attending the use of quince stocks to engraft on.—The quince, we believe, is not naturally so long lived as the apple tree, its age, it is said, seldom exceeds ten or twelve years. The quince tree is quite as liable to be attacked by the worm called the borer as the apple tree.

(By the Editor.)

ON THE MANAGEMENT OF COWS KEPT FOR THE DAIRY.

Where butter is the chief object of a dairy, care should be taken to select such cows as afford the best and largest quantities of milk and cream of whatever breed they may be. But the quantity of butter to be made from a given number of cows must always depend on a variety of contingent circumstances; such as the size and goodness of the beasts; the kind and quantity of food and the distance of time from calving. A large cow, generally, will give more milk than one of smaller size; though cows of equal size differ as to the quantity of cream produced from the milk of each; it is therefore, in those cows whose milk is not only in large abundance, but which from a peculiar inherent richness yields a thick cream, that the butter dairyman is to place his chief dependence; and where a cow is deficient in either of these she should be parted with and her place supplied by one more proper for this use.

Where cheese is the object, the management in respect to cows should be the same.

It is essential that milk-cows be kept at all times in high health and good condition. If they are allowed to fall off in flesh during winter, an abundant supply of milk need not be expected by bringing them into high condition in summer. Warm stables should be provided for them, as beasts will not require so much food when kept warm as when shivering with cold.

For about a month previous to the time of cows calving, if in spring, they should be turned into sweet grass; or, if it happen in the winter, they ought to be well fed with the best hay. The day and night after they have calved, they should be kept in the house, and no cold, but luke-warm water allowed for their drink. On the next day, about noon, they may be turned out, yet regularly taken in, during the night, for three or four successive days; after which they may be left to themselves. Cows, thus housed, should be kept in their stables till the cold is mitigated by the morning sun, and it is recommended to give them a draught of warm water previous to their being turned out. Without such precautions they are liable to miscarry, or slip their calves; an accident by which the calf is lost and the cow injured. For some time before and after they have calved they should be kept separate from the young stock, whether in the yard, stable, or field.

English writers assert that Lucerne is most excellent food for cows in milk; and preferable to clover, as it gives the milk a better flavor and is equally nourishing. It is esteemed the best of all

grasses for cutting green and feeding out in racks or cribs, and will bear cutting the oftenest.

Mr. London says "The time cows should become dry before their calving is not agreed on, some contending that they may be milked almost to the time of their dropping their calf without injury; while others maintain that it is absolutely necessary that they should be laid dry from one to two months, both for the advantage of themselves, and of their calves. It is probable that much in this business depends on the manner in which they are kept; as where they are well fed they may be continued in milk till within a week or two of calving without suffering any injury whatever from it, but in the contrary circumstances it may be better to let them run dry for a month, six weeks or more according to their condition, in order to their more fully recruiting their strength. It appears not improbable that the longer the milking is continued, the more free the cows will be from indurations and other affections of the udder; which is a circumstance deserving of attention. Where only one or two cows are kept for the supply of a family, it is likewise useful to know that by good feeding they may be continued in milk without any bad consequences till nearly the time of calving. In the *Agricultural Survey of the West Riding of Yorkshire* it is stated, that no advantage was found to result from allowing cows to go dry two months before calving. They have there been kept in milk within ten days of the time of dropping the calf. This practice however, cannot be considered generally advisable."

In the last edition of Willch's Encyclopedia it is said that "inflamed teats should be washed with two drachms of sugar of lead in a quart of water. Should tumors appear, apply a common warm mash of bran with a little lard. And to prevent cows from sucking their own milk, we are informed that rubbing the teats frequently with the most fetid cheese that can be procured has proved an effectual remedy."

From Marshall's Minutes of Agriculture.

MANURE AS APPLIED TO DIFFERENT SOILS.

During the drought of summer, *clayey soils* are divided by innumerable fissures; and if the manure be laid on while the soil is in this state, the first shower of rain carries down the dissoluble particles into the vegetative stratum. But, in winter, a retentive soil resembles a sponge filled with water; and the manure laid on, while it remains in this state, must either be washed away by heavy rains, or be lodged near the surface; and cannot possibly penetrate the soil until it be made porous by the ensuing summer's drought. On the contrary, an *absorbent soil* is always open to superficial moisture; it resembles a dry sponge, which greedily absorbs the moisture it can reach; and as fast as the manure laid on such a soil is liquified, it is received by the mould. The danger here, perhaps, lies in its being hurried through the vegetative stratum. Is not winter then the fittest time for feeding such a soil, when the current of absorption is gentlest, rather than summer, when its rapidity may hurry down the vegetative food, and prevent its being incorporated with the plant-feeding mould? And is it not obviously eligible, on such a soil, to lay the manure on the *surface*, at the greatest distance from that depth at which it becomes useless, rather than to bury it in the

soil, where it may more readily escape below the sphere of vegetation?

The writer is, *at present*, so fully satisfied with the former part, at least of this theory, that he is determined not to manure in future the surface of a retentive soil, when its pores are full; he will either embrace the opportunity when dry weather has rendered it absorbent, or bury the manure in the soil; in which situation it may meliorate, not only, *perhaps*, as a food, but also as a provocative.

FELLING TIMBER.

Different seasons of the year for felling timber that is designed for durability, are recommended by writers. Some say in May, while the sap is vigorously flowing; others in September, when the alburnum or white wood, is not so full of ascending sap, that contains saccharine matter, acids and mucilage, which ferment and produce the decomposition of the wood. The different and contradictory opinions arise in a great measure from partial experiments and too limited observation. There are many circumstances to be taken into consideration—the maturity of the tree, the nature of the soil, the difference in climate, the state of the season and many others. Facts have been produced of trees felled in May lasting twice as long as those in February, and also *vice versa*. All writers we believe agree that peeling the bark in May and letting the tree stand for several months greatly promotes durability. The proper time can only be ascertained by the accumulation of facts; and for this accumulation there is no better way than for every farmer to record the time of felling his trees, with as many other circumstances as possible. Were farmers generally in the habit of keeping a diary, much more rapid progress might be made in agricultural knowledge.—N. Y. Farmer.

PRINCE ON HORTICULTURE.

Mr. Prince, who is so well known as a horticulturist, has published a short treatise on Horticulture, containing, as he says, "some of the leading rules whose adoption has proved most successful, and intended as an accompaniment to the catalogues and an aid to those who are ignorant of the subject." A work of this moderate pretension would not excite much expectation; it contains, however, a mass of useful information, and forms, in our opinion a valuable contribution to the horticultural science of our country. Mr. Prince is the proprietor of one of the richest and most extensive garden establishments of this or any country; and no expense or labor has been spared to collect fruit and ornamental plants of every description; and no where has so large a number of American species been brought together.

The work before us is particularly valuable as containing the results of long experience in acclimating foreign plants, and in domesticating many of our indigenous fruits which will hereafter form most important additions to the luxuries of our gardens.

A large portion of the work is devoted to the grape, which, although not of greater importance as a national object of cultivation than the apple, still it is of the highest interest, and will, we hope, continue to be the subject of experiment with cultivators throughout the Union. We recommend the work to every lover of ornamental gardening, as useful in pointing out the choicest kinds of shrubs and trees which most easily admit of profitable culture.—*Ibid.*

FOR THE NEW ENGLAND FARMER.

NORTH DEVON STOCK.

MR. EDITOR.—About four years ago a friend imported from England a very fine *bull* of the above breed; a gentleman well acquainted with stock, having recommended it, believing from their moderate size and similarity to our native stock, they were better fitted to New England pastures; and also their well known activity as working cattle and respectability as milkers.—This animal, for two years, was kept in *Sandwich, N. H.* a town, for many years past, noted for a large and fine breed of cattle, to which they were much attached; and it is stated by one of their most noted breeders, who writes under the date of November 20th, 1828, "the Devon breed are much approved of, they do well to mix with our large *Sandwich* breed, we have no heifers yet in milk—no steers, as the males were all kept for bulls; our heifers are very fine and promise good cows; there are but few of the *Devons* now in *Sandwich* as they have been sold into different sections of the country. I sold my calves (which were all bulls last season) one for \$20, one for \$25, one for \$40, and one for \$50."

These prices are considered great, when compared with the usual prices of calves of the common breeds, probably not more than five dollars.

The North Devon is now in *Westminster, Vt.* where he is said to be in high repute; and will doubtless do much good in the improvement of their stock. After the next spring this very handsome and valuable animal will probably come back to *Massachusetts*. A SUBSCRIBER.

EXTRAORDINARY YIELD.

The River La Plate, or long red Potato, is noted for its fruitfulness. A gentleman of this town raised the present season from two bushels and a peck, fifty bushels.

The ground was broken up last year, planted with potatoes and manured very liberally. The present year it was not manured at all. The potatoes were cut into one or two pieces; one piece was planted in a hill and the eyes were carefully placed uppermost. They were hoed as soon as they were up, and also after they were about six inches high. Another person informs us, that he once raised over three pecks from one potato of this kind.—*N. E. Farmer and Mech. Journal*.

From the American Farmer.

THE BEECH TREE.

Proof against the Electric Fluid.

MR. SKINNER.—The communication in your paper upon the subject of the effects of lightning upon cedar, or rather its non-effect, has induced the following. I give you the facts so far as I am able, and they may lead to some further observations, which may result in usefulness.

Passing through some of the wilderness districts of Ohio during the last summer, in company with a gentleman who had spent his life in the woods, surveying and exploring, when a heavy thunder storm came up, and it was then observed by the gentleman that we would try and find a beech tree under which to take shelter. In the course of conversation it was stated that it was a common opinion among surveyors and woodsmen, that the beech possessed the quality ascribed to the cedar, that one had never been known to be stricken by lightning, and that during the heaviest thunder storms, they felt perfectly secure when they could

find shelter under the spreading branches of a large beech.

The statement induced me to further observation and enquiry. I have never since passed a tree which had been riven by lightning, without its recalling it to my recollection, and caused me particularly to notice it; and I presume I have passed an hundred oaks which have been stricken, and although beech is more common than any other timber, I have not discovered one of that kind, nor have I any recollection of ever having seen one previous to the above occasion which called it particularly to my notice. I have also uniformly learned upon enquiry of those who are accustomed to the woods, that such is the prevailing opinion as stated.

I give you the facts as I have them. If they are well founded, and if the timber stated has the property of resisting the effects of lightning, it is proper it should be universally known. One well attested instance of a beech having been struck by lightning would at once decide the question, and show the fallacy and error of the opinion, as it should be, if without foundation. On the contrary, if an instance of similar character with the one described in the Farmer could be referred to, it would go very far in establishing the position. In an agricultural view it is worth enquiry. If beech has this property as contended, and as animals in storms seek shelter, it would be well to leave, in clearing, or plant beech trees, where grazing animals might seek shelter and safety.

Yours, with much respect.

Dryton, Ohio, Dec. 1, 1828.

H. B.

A few days ago the gardener of Mr. Thomas Goodwell, of Eastwood, gathered a cucumber eight inches long and six inches in circumference whose blossom had never expanded; no seeds were found in the fruit. The same gardener, on the 14th inst., gathered a plate of raspberries of excellent flavor, and expects several others in a few days. An apple tree of William Lamb's in the same parish, is now in blossom, and a portion of the blossom set.—*Nottingham Journal*.

Improvement of Candles.—A writer in *Brewster's Journal* says he steeps the cotton wick in lime water in which is dissolved a considerable quantity of *nitrate of potasse*, common nitre, or salt petre; by this means he secures a purer flame and more superior light—a more perfect combustion is ensured—snuffing is rendered nearly as superfluous as in wax candles, and the candles thus treated do not "run." The wicks must be thoroughly dry before the tallow is put to them.

From Drummond's First Steps in Botany.

Much of the beautiful vesture, and of the endless variety in the forms and colors of vegetables, has been given for the express purpose of attracting the admiration of man, and exciting him to their serious contemplation. This observation indeed may be applied to every department of nature. Why, for instance, have shells such uncommon beauty of form, colors, and polish, but that the examination of them may enlarge the field of intellect? The inhabitant of the common shell is housed as safely in its simple residence of calcareous earth, as that of the *Nautilus Pompilius* in a chambered palace, whose walls are like pearls and silver; and the shell of the limpet serves as well for protection, as the canopy of the

haliotis which glitters with the colors of the rainbow. Why is the goldfinch more ornamented than the sparrow, since it could fly as swiftly, though its plumage were equally dusky? and why is the peacock embellished with a combination of every hue that is beautiful and brilliant, when it could pick up its grain equally well, although it wore the unassuming dress of its more humble companions of the court-yard? Thousands of other instances might be adduced, to show that a chief part of the beauty and variety which occur in the different kingdoms of nature, have been intended for the mind of man; and no where perhaps, is this more conspicuous than in the profusion of plants which clothe our globe, in which

No gradual bloom is wanting; from the bud
First born of Spring to Summer's musky tubes;
Nor hyacinths of purest virgin white,
Low-bent and blushing inward; nor jonquills
Of potent fragrance; narcissus fair,
As o'er the fabled fountain hanging still;
Nor broad cornations, nor gay-spotted punks;
Nor, shower from every bush, the damask rose;
Infinite in pombers, delicacies, smells,
With hues on hues expression cannot paint,
The breath of nature and her endless bloom.

Now what can give a more pleasing view of the benevolence of the Almighty than thus to see the earth "apparelled with plants, (says old Gerard) as with a robe of embroidered work, set with orient pearls, and garnished with great diversities of rare and costly jewels?" How little giver to observation and reflection must they be, who can look on such a scene, and see in it only the workings of chance, or who feel as little impressed by it as though it were. People in general, indeed, have never thought of the extent of power, and profundity of wisdom displayed in the formation of the vegetable world; but were we in imagination to conceive the existence of a being endued with ten thousand times the powers that any human mind ever possessed; and that to such an intelligence were submitted the privilege of clothing a world with organized bodies formed after its own conceptions, how comparatively miserable, how destitute, would such a creation be! how unlike that which arose when "the evening and the morning were the third day," when "the earth brought forth grass, and herb yielding seed after his kind, and the tree yielding fruit, whose seed was in itself after his kind; and God saw that it was good!"

The House of Representatives in New Hampshire have passed a resolution that they will make use of no ardent liquors at their boarding-houses during the present session of the Legislature.

A singular case is mentioned in the last volume of the Medical Journal, of the complete restoration of the hair of the head in a person who had become quite bald, by the use of a solution of sulphate of copper in French brandy. As the application, when used only once a day, cannot be injurious, it is worth a trial in case of baldness.

Salt water has been obtained in Susquehanna county by boring to the depth of 550 feet. It is thought that sufficient salt will be obtained from the spring to supply the country—50 gallons of water afford one bushel of salt.

Two wild turkeys were shot in the northern part of this town on Monday the 8th instant—one weighing twenty-three pounds and a quarter, and the other eighteen pounds and a quarter.—*Hamp. Gazette*.

THE LATE JUDGE PETERS.

We have been favoured by the author with a copy of an Address delivered before the Blockley and Merion Agricultural Society, on the death of their late President, the Hon. RICHARD PETERS. By SAMUEL BRECK, Vice President of the Society. We have seldom, if ever, seen an Obituary Discourse of more interest. It contains nothing florid, tumid or exaggerated, but gives a sketch of the principal events which occurred in the life of a man, who in every sphere of action to which his versatile talents introduced him, was highly and justly distinguished. The times which "tried men's souls," tested his worth; and his labors to systematize and enlighten American Husbandry will be remembered with gratitude as long as subsistence is derived from tillage, or the light of science shall illumine the path of the practical cultivator.

The following extract gives a concise view of the benefits, which American agriculture has received from the exertions of the worthy character whose merits the ADDRESS was designed to commemorate.—EDITOR N. E. FARMER.

"We now approach, gentlemen, a period in the life of our departed President, which brought us into close intimacy with him. It was a long period of wide-spread usefulness, in which he moved almost without a rival. As a practical farmer, Mr. Peters had from time to time communicated the results of the experiments made at Belmont, to such of his neighbors as chose to profit by them; but he had not written much, if any thing, upon agriculture, before the year 1797. His first publication was then made, and contained a statement of facts and opinions in relation to the use of Gypsum. This pamphlet circulated widely, and produced such a change in husbandry, by introducing the culture of clover, and other artificial grasses, as gave, we all know, a magical increase to the value of farms. Estates which until then were unable to maintain stock, for want of winter fodder, and summer pasture, were suddenly brought into culture, and made productive. Formerly, on a farm destitute of natural meadows, no stock could be supported; and even where natural meadow existed, the barn yard was exhausted to keep up sufficient fertility, (in the absence of irrigation,) to feed a very few horses and black cattle.

Such was the situation of our husbandry, for some years after the revolution. It is proper to advert to it, that we may understand the full extent of our obligation to the Judge. In the year 1770, he was shown the effects of gypsum on clover, in a city lot, occupied by Mr. Jacob Barge, on the commons of Philadelphia.

The secret of its powerful agency, came from Germany, where it was accidentally discovered. Mr. Peters obtained a small quantity, which he used successfully, and gradually promoted its consumption, until by his example, and his publications, the importation from Nova Scotia alone, into the single port of Philadelphia, increased to the enormous amount of fourteen thousand tons annually. This was before the discovery of that fossil in the United States.

Inquire in the counties of Chester, Lancaster, and others around us, where clover is so beneficially cultivated, how much is due to that excellent man, for the great pains he took to extend the use of gypsum? On this subject, I very recently transmitted to the Judge, a testimonial of

gratitude from one of the most intelligent persons of Lancaster; who unhesitatingly ascribes to Mr. Peters' book on plaster, and his other agricultural essays, the merit of having produced a good part of the rich cultivation, for which that county is so celebrated. But his rural labors were not confined to the tilth of the ground; to the mere variety of grasses, or alimantal improvement of the soil which produced them; for we find him zealously employed, in mending by crosses, the breed of sheep and other animals. To him was confided the care of the broad-tail Barbary rams, procured at Tunis, by General Eaton. The Judge placed them advantageously, and pressed on the farmers, by repeated written exhortations, the propriety of using them.

In order to appreciate properly the industry of this gentleman, in treating on husbandry and matters auxiliary to it, we must consult his voluminous communications, published in the Memoirs of the Philadelphia Agricultural Society. Take, for instance, the first volume. There, we find him discussing with his accustomed animation, and clear and elegant style, the following topics—

- On hoven cattle.
- On peach trees.
- On yellow water in horses.
- On gypsum.
- On the thickness, cement and materials of walls.
- On orchards.
- On coarse flour.
- On brown bread.
- On the force of habit, as it relates to esculents.
- On new herbs and shrubs appearing after firing woods.
- On trench ploughing.
- On hemlock for live fences.
- Remarks on, and plan of, a stercoreary.
- On changes of timber and plants.
- On races of animals extinct.

These numerous articles, so various in their character, are, as I have said, contained in the first volume, and are all copiously and ably treated by him. The succeeding volumes are no less rich in original essays on the science and art of agriculture, from the same prolific pen. Perhaps it is not estimating the *quantity* of his labour too high, if we place it at one fourth of each volume; the *quality* of these productions, must be valued according to their wide circulation, and great popularity.

This distinguished citizen, always vigilant in promoting objects of public utility, founded our Society, and presided over it from the day of its creation until his death. You, gentlemen, will one and all, I confidently assert, most readily and most gratefully bear witness to his constant solicitude for the advancement of the objects of our association. How often has he pressed us to attend to them! His superior sagacity could discover a usefulness in labours, which we had not before thought important. When, at length, we yielded to his wishes, and consented to register the occurrences on our farms, how much information was elicited! The improvement derived from this mutual examination, was acknowledged by us all. It is much to be regretted, that these business-like meetings have been few and far between. But such as they were, and transient as they now are, I dare refer to the records for proof of their solid worth. What, though they have been followed by occasional listlessness, indifference, or non-attendance, that baffled the later efforts of our

good President; may we not remember that our early zeal, though short-lived, was salutary! Can we not revive it? Let us try, if it be only to show our love for the man who first inspired it. Our opinions on rural matters; our knowledge of agricultural facts, then so freely communicated, stand on record; we then possessed the attributes, as well as the name, of an Agricultural Society.—Those communications, evinced by their variety, their practical meaning, their good sense, and not unfrequently, their novelty; the rich fund of information among us in the concerns of husbandry, and show how profitably it may be again employed. We have but to will it, in order to restore it to its former usefulness."

(From the New York Farmer and Horticultural Repository.)

ON THE CULTURE OF THE NATIVE GRAPE.—BY PROF. GIMBREDE.

It is said that every man owes something to the community in which he lives. As I admit the truth of this obligation, it gives me pleasure to address you on the subject of *American grapes and vineyards*.

The agricultural and moral interest of the country seems to call for such information, and if I may be permitted to offer an opinion, the results of my own experience and observations in France, and in this my adopted country, after a residence of twenty-six years, I shall deem myself happy if I can give a useful example to follow.

I well know the many respectable opinions already published on the subject, and therefore wish to support by facts only, the feasibility of improving your native grapes, and to help to counteract the most injurious of all prejudices, namely, *that you must plant your vineyards in America, with the vines of the continent of Europe!* and thereby trample under foot, and sweep off from the surface of this highly favored land, with a culpable indifference, some of the most valuable varieties, many of them quite unique, with which the great God of Nature kindly provided these United States.

Allow me to say, that such facts as these are altogether unreasonable,—and I therefore expect much from your patriotic and scientific Association, in protecting and diffusing a true knowledge of your internal agricultural resources. I cannot pass unnoticed, the prevailing idea that the lands of vineyards are the southern and western States. I hope I shall be permitted to add, come and see a flourishing one on the banks of the *beautiful* Hudson. Moreover, many who have attempted to plant their vineyards in that section of our country, have abandoned it.

I shall point out at some other time, the causes of their failure in this country. Every farmer wishing to cultivate vineyards, ought to know this fact, that in Europe there are not two counties, sometimes not even two fields, that will ever produce the same reputable wine, planted with the same stock; and if planted here, you certainly could not expect to be more successful; and if made here with the vines of Europe, you could not call it a real American wine; therefore, what I should say would constitute a real American wine, would have a distinct character in the taste and flavor—a pleasing variety for the table—a *non-such*, made with the best varieties of the fox-grapes, improved by culture. Such wine would soon find its way to Europe, and command a high price.

On a subject like this, so important, and on

which volumes have been written, I know not where to stop my remarks, and can only hope to awaken the public interest on their own resources and comfort.

Having made it an amusement this seven years past, to pour some of the native grapes, I have obtained several very valuable varieties from my seedlings, and have also much improved others by culture. The nursery which I have at present at West Point, may enable me to plant two acres next season.

I wish it to be perfectly understood, that I am an advocate for some few of the varieties of the European grape in our gardens only for the table, in addition to the Isabella and a few others of this country, which not only are good for the table, but are excellent to make wine.

Yours respectfully,

THOMAS GIMBREDE.

DEW IN EGYPT AND PALESTINE.

We had a tent allotted to us for the night, and although it was double-lined, so copious are the dews of Egypt after sunset, that the water ran plentifully down the tent-pole. The vegetation of Egypt, even the redundant produce of the Delta, is not owing solely to partial inundation from the Nile, or artificial irrigation. When we hear that rain is unknown to the inhabitants, it must not be supposed the land is on that account destitute of water. From all the observations we made during our subsequent residence, it seemed doubtful whether any other country has so regular a supply of moisture from above. Even the sands of the desert partake largely of 'the dew of heaven,' and in a certain degree of the 'fatness of the earth.' Hence it is that we meet with such frequent allusion to the copious dew distilled upon Oriental territories in the sacred writings. 'Brotherly love is compared by David to 'the dews of Hermon.' The goddess of Judah is described as 'dew': 'The remnant of Jacob shall be,' it is said, 'in the midst of many people as a dew from the Lord.'—*Tour in Egypt*.

REMEDIES AGAINST SEA-SICKNESS.

Sea-sickness has puzzled more grave doctors than one. On the present occasion I had no other resource than to submit to fate, and much good it did me. To the Countess, however, of whose health I had taken charge, and who I understood, suffered considerably from sea-sickness, I administered immediately before embarking, forty drops of Laudanum. She remained, during the whole of the passage, in her carriage, and declared to me that not only she had not been ill, but that she had not even experienced the slightest of those appalling qualms which rob the cheeks of the most stout-hearted of their bloom, and unman us all.—Assuming the state of the stomach during sea-sickness to be one of irritability, this happy effect of opium can readily be understood. I again tried it on my return to England and with the same success.—*Dr. Granville's travels to St. Petersburg.*

RAIL ROAD FROM BOSTON.

We copy the following remarks from the Ohio Sun.

"As much as has been said on the subject of Internal Improvements, and Home Industry, there is still room left, if not for TALKING, at least for DOING. We would not give one bright eyed, and 'brawny shouldered' fellow that is found whistling in his fields with his axe or hoe swinging in

his nervous grasp, ere Phœbus shows her golden face o'er the beachen forest; for all the cold plodding, head-working race of animals that sit in their chimney corners, with their arms folded, arguing with sage presumption, the importance of our National Legislature, enacting laws to encourage them in their labors."

LUMBER TRADE OF PROVIDENCE.

The Providence American states, that 325 cargoes of lumber arrived at that port during the last year, from Maine, and were disposed of for cash. The town of Worcester, which formerly obtained its supply of lumber from Boston, now receives it from Providence. The diversion of this important trade from Boston will be severely felt in the metropolis. If this city sleeps much longer she will be shorn of all her strength.—*Salem Observer*.

MASSACHUSETTS AGRICULTURAL SOCIETY.

The American Farmer gives a short history of this Society. It was incorporated in 1792, and a fund was subscribed amounting to 3984 dollars. Governor Gore was one of the contributors and gave 1000 dollars. Dr. Lettson, of London, the celebrated philanthropist, gave ten guineas. The fund now amounts to 14000 dollars. The Society receive from the State, 600 dollars annually.—The amount of Premiums given by the Society, since the establishment of Cattle Shows, have averaged about 1200 dollars per year. In a notice of the festival, given by the Society, it is stated, that Mr. Dabney of Fayal, has for the last four years presented, for the annual dinner, a quarter cask of the best Pico wine which he could find on the Island.—*Salem Observer*.

The potatoe was at first positively proscribed in France. Baudin relates, that in his time, its use was prohibited in Burgundy, because it was supposed to generate leprosy! It was chiefly through the exertions of the celebrated chymist Parmentier, that the prejudices of the French people against it were removed, and that it was brought into general use among them. Yet even, as late as the revolution, so little were the vulgar reconciled to this species of food, that on Parmentier being proposed for some municipal office, one of the voters furiously opposed him on account of the share he had in their introduction—"He will make us eat nothing but potatoes," said he "for it was he who invented them."—*Mechanic's Mag.*

The potato trade.—We sometimes find something a little amusing, as well as much that is instructive, in the public documents. Thus, among our articles of provisions exported from the United States to Great Britain, in 1827, we find *two bushels* of potatoes, which must have been excellent ones, as they brought us the liberal sum of two dollars. On the other hand, we imported from the dominions of Great Britain, (mostly we presume from Ireland,) no less a quantity than twenty thousand eight hundred and ninety-two bushels of potatoes, of the average value of about forty cents a bushel. Deducting the two bushels we exported, for which we got two dollars, the balance of the potato trade is greatly against us—no less, indeed, than *twenty thousand eight hundred and sixty bushels*, equal to eight thousand four hundred and ninety seven dollars.

Brattleboro Messenger.

Hand engines.—On the 4th inst. the south wing of the dwelling house of Joseph Strong, Esq. of South Hadley, was discovered to be on fire; the inside of the kitchen was soon all in flames, and a high wind blowing towards the main house, it seemed impossible to save the buildings. Some hand-pumps, or engines were then obtained and put in operation, and by the use of these the fire checked, and in a short time extinguished. These small engines undoubtedly saved the whole range of buildings from being destroyed by the devouring element. The damage now sustained is only two or three hundred dollars.

The utility of hand-engines for extinguishing fire has been fully demonstrated, and it would be well to bring them into more general use. They can be managed by females and children, and fire within a building, or on the roof, may be overcome in a few minutes by means of one of them and a few pails of water. They are useful also for watering gardens, washing windows, &c. They are made by Mr. Holland, of Belchertown, Mr. Horace Brainard, of Northampton, and probably by other mechanics.—*Hamp. Gazette*.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, DEC. 19, 1828.

ECONOMY IN FEEDING CATTLE.

There is a remarkable difference in cattle's eating straw when fresh threshed, and when it has been threshed several days. But if fresh threshed straw is cut and mixed with hay of pretty good quality, and the whole sprinkled a little with a pretty strong solution of salt and water, and permitted to lie in a heap for several days the mixture will improve in quality.

Much chaff and straw that is often thrown away, may with a little pains be made good fodder for cattle, by being mixed with corn stalks cut with a machine, and sprinkled with fine salt and water, if the mixture will bear wetting. The sweetness of the stalks and hay is imbibed by the chaff and straw, and the whole will make a compound very agreeable to cattle. They should not however, be confined wholly to salted food, but have fresh messes a part of the time.

When young animals are pinched for food at an early part of their growth, or fed with such as is not of a sufficiently good quality, they never thrive so well, nor make so good stock afterwards. It is said in Young's *Farmer's Calendar*, that "in the winter the yearlings should be fed with hay and roots, either turnips, carrots, potatoes, mangel wurtzel, or ruta baga, and they should be thoroughly well fed, and kept perfectly clean by means of litters. At this age it is matter of great consequence to keep such young cattle as well as possible; for the contrary practice will stop their growth, which cannot be recovered by the best summer food. If hay is not to be had, good summer straw must be substituted, but then the roots must be given in greater plenty and with more attention. To steers and heifers two years old, the proper feed is hay, if cheap, or straw, with baits of turnips, cabbages, potatoes, &c. It is not right to keep yearling calves and two years old together, because in general the younger cattle are, the better they must be fed."

When a farmer is apprehensive that he has too much stock for his fodder, it is best not to stint them in their allowance as much in the fore part

as in the latter part of winter; for cattle are more liable to be pinched with cold in December and January than afterwards when they become habituated to rigorous weather. Advantage may also be made of browsing more in the latter than the fore part of winter, as the buds begin to swell and the twigs have more sap in them than in the early part of the season.

If a farmer proposes to feed his cattle with potatoes or other roots, it will be better to give them but a small quantity at first, increasing it by degrees as they become accustomed to that sort of food. It will, likewise, be better to give them a little every day than a large quantity once in three or four days or a week.

ENTOMOLOGY.

One would not think that the excrements of insects could be objects of terror, yet so it has been. Many species of Lepidoptera, when they emerge from the pupa state, discharge from their anus a reddish fluid, which in some instances, where their numbers have been considerable, has produced the appearance of a shower of blood; and by this natural fact, all those bloody showers, recorded by historians as preternatural, and regarded, where they happened as fearful prognostics of impending evils, are stripped of their terrors, and reduced to the class of events that happen in the common course of nature. That insects are the cause of these showers is no recent discovery; for Sleidan relates that in the year 1553, a vast multitude of butterflies swarmed through a great part of Germany, and sprinkled plants, leaves, buildings, clothes, and men, with bloody drops, as if it had rained blood. But the most interesting account of an event of this kind is given by Reaumur, from whom we learn that in the beginning of July 1608, the suburbs of Aix, and a considerable extent of country round it, were covered with what appeared to be a shower of blood. We may conceive the amazement and stupor of the populace upon such a discovery, the alarm of the citizens, the grave reasonings of the learned. All agreed, however, in attributing this appearance to powers of darkness, and in regarding it as the prognostic and precursor of some dreadful misfortune about to befall them. Fear and prejudice would have taken deep root on this occasion, and might have produced fatal effects upon some weak minds, had not Mr. Perresse, a celebrated philosopher of that place, paid some attention to insects. A chrysalis, which he preserved in his cabinet, let him into the secret of this mysterious shower. Hearing a fluttering, which informed him that his insect had arrived at its perfect state, he opened the box in which he kept it. The animal flew out and left behind it a red spot. He compared this with the spots of the bloody shower, and found they were alike. At the same time he observed there was a prodigious quantity of butterflies, flying about, and that the drops of the miraculous rain were not to be found upon the tiles, nor even upon the upper surface of the stones, but chiefly in cavities and places, where rain could not easily come. Thus did this judicious observer dispel the ignorant fears which a natural phenomenon had caused.

Every one has heard of the death-watch, and knows of the superstitious notion of the vulgar, that in whatever house its drum is heard one of the family will die before the end of the year. These terrors, in particular instances, where they

lay hold of weak minds, especially of sick or hypochondriac persons, may cause the event that is supposed to be prognosticated. A small degree of entomological knowledge would relieve them from all their fears, and teach them that this heart-sickening tick is caused by a small Beetle, (*Anobium tessellatum*, F.) which lives in timber, and is merely a call to its companion. Attention to entomology may therefore be rendered very useful in this view, since nothing certainly is more desirable than to deliver the human mind from the dominion of superstitious fears, and false notions, which having considerable influence on the conduct of mankind are the cause of no small portion of evil.

But as we cannot well guard against the injuries produced by insects, or remove the evil, whether real or arising from misconceptions respecting them, which they occasion, unless we have some knowledge of them; so neither without such knowledge can we apply them, when beneficial to our use. Now it is extremely probable that they might be made vastly more subservient to our advantage and profit than at present if we were better acquainted with them. It is the remark of an author, who himself is no entomologist: "we have not taken animals enough into alliance with us. The more spiders there were in the stable, the less would the horses suffer from the flies. The great American fire-fly should be imported into Spain to catch mosquitos. In hot countries a reward should be offered to the man who could discover what insects feed on fleas." It would be worth our while to act upon this hint, and a similar one of Dr. Darwin. Those insects might be collected and preserved that are known to destroy the aphides and other injurious tribes; and we should thus be enabled to direct their operations to any quarter where they would be most serviceable;—but this can never be done till experimental agriculturists and gardeners are conversant with insects, and acquainted with their properties and economy. How is it that the great Being of beings preserves the system which he has created from any permanent injury, in consequence of the redundancy of any individual species, but by employing one creature to prey upon another and so overruling and directing the instincts of all, that they may operate most, where they are most wanted! We cannot better exercise the reason, powers, and faculties with which he has endowed us, than by copying his example. We often employ the larger animals to destroy each other, but the smaller, especially insects, we have totally neglected. Some may think, perhaps, that in aiming to do this, we should be guilty of presumption, and of attempting to take the government and direction of things out of the hands of Providence;—but this is a very weak argument, which might with equal reason be adduced to prove that when rats and mice become troublesome to us, we ought not to have recourse to dogs, ferrets, and cats to exterminate them. When any species multiplies upon us, so as to become noxious, we certainly have a just right to destroy it, and what means can be more proper than those which Providence itself has furnished? We can none of us go further or do more than the Divine Will permits; and He will take care that our efforts shall not be injurious to the general welfare or affect the annihilation of any individual species.

Again, with regard to insects that are employed in medicine or the arts, if the apothecary cannot

distinguish a Lythe from a Carabeus or Cetonia, both of which I have found mixed with the former, how can he know whether his druggist furnishes him with a good or bad article? And the same observation may with still greater force apply to the dyer in his purchase of cochineal, since it is still more difficult to distinguish the wild sort from the cultivated.

There are, it is probable, many insects that might be employed with advantage in both these departments; but unless entomology were more generally studied by scientific men, who are the only persons likely to make any discoveries of this kind, than it has hitherto been, we must not hope to derive further profit from them. It seems more particularly incumbent upon the professors of the divine art of healing to become conversant with this as well as other branches of Natural History; for not only do they derive some of their most useful drugs from insects, but many also of the diseases upon which they are consulted, are occasioned by them. The profit we derive from the works of creation will be in proportion to the accuracy of our knowledge of them and their properties.

TOMATO SAUCE.

Peel about one dozen good sized Tomatoes—put in a stew pan, with about two teaspoonsfull of brown sugar, a little salt, some pepper, and about one table spoonfull of flour from a dredging box, and a small piece of butter—stew slowly one hour and a half—(Do not add any water.) Some persons prefer pounded cracker instead of flour.—[Communicated in answer to Mr Glazier's inquiries last week.]

From the New York Statesman.

HORTICULTURE.

We have perused with a high degree of satisfaction the proceedings of a public meeting at Geneva, for the organization of an extensive Horticultural Society in the western counties of New York, of which the subjoined notice from the Albany Argus is a correct abstract. In the list of officers our readers will recognize many gentlemen of talents and high attainments, from whose concentrated efforts results of great public utility may be anticipated. Never was there a wider or a fairer field opened for their transactions; and we congratulate the Society in this city, that a kindred association has been formed in the interior of the state, between the members of which we hope good fellowship and a cordial co-operation may exist. *We will merely add, that the example set by the western counties, is worthy of imitation in other parts of the state and country.*

A number of gentlemen of the western counties assembled recently at Geneva, and organised as "The Domestic Horticultural Society of the western part of the state of New York." The following officers were appointed, viz:—

JOHN GREIG, *President.*

Daniel Kellog, Enos T. Throop, Abijah Miller, Isaac G. Ogden, Graham H. Chapin, Abraham Dox, James Wadsworth, James K. Guernsey, David E. Evans, and Herman H. Bogert, *Vice Presidents.*

Andrew Glover, *Secretary.*

Joseph Fellows, *Treasurer.* And

William Kirkpatrick, David Thomas, Daniel L. Bishop, Charles W. Dey, Wm. H. Adams, Samuel E. Ellsworth, George Hosmer, Elisha B. Strong,

Jacob Le Roy, and Bowen Whiting, *Committee of Managers.*

The Society embraces the counties of Onondaga, Cayuga, Seneca, Tompkins, Ontario, Wayne, Yates, Monroe, Livingston, and Genesee; and the vice presidents and committee of managers are selected one from each of those counties. — Previous to the organization of the Society, an initiatory discourse was delivered by MYRON HOLLEY, Esq. a copy of which has been requested and obtained for publication. T. D. BURRALL, Esq. was appointed to deliver the next address.

New Printing Press.—That "this is an age of improvement," is in nothing perhaps more strongly verified than in the advances made within the last few years in the art of printing. But a short period has elapsed since the screw press was deemed the only machine of practical utility in printing; but it is now fast getting out of use. Numerous substitutes have been invented, and great saving of time and labor effected. But we have heard of none in which these objects have been so thoroughly attained as in one lately constructed and now in *successful operation* in this village. It is the invention of an ingenious mechanic of this place, and constructed for Messrs. Holbrook & Fessenden, who have spared no expense in bringing it to a comparative state of perfection. It is moved by water power, but may be carried by steam, horse, or otherwise, as may be most convenient. It requires the labor of two girls only to tend it, one to lay on and the other to take off the sheets.

The construction is simple, and the machinery little liable to get out of repair; it is also compact, occupying little more space than the common hand press. The expense of this press, compared with the facility of its operations and the reduction of labor, is by no means extravagant, not exceeding four times the cost of an iron hand press, while it does the work of more than two *at one quarter the expense*, and in a superior style.

We have always doubted the feasibility of constructing a good press in which cylinders should give the impression, and believe that platens, which are used in the one under present notice, will always be necessary to give a clear and handsome impression. It is also doubted whether much greater facility can be given to a platen press than is possessed by the above, which throws off about twelve sheets a minute, which is as rapid as the sheets can safely be applied.

Thus far we have stated what has been done and is now doing every day. We understand however that Messrs. H. & F. have another press now constructing which will embrace some improvements; it is contemplated to remove the sheets by machinery, and thereby dispense with the labor of one hand, in which case the expense of printing will be yet further reduced.

Measures, we are told, are being taken to secure the exclusive right to the above invention both in this country and Great Britain; and so fully satisfied are the proprietors (Messrs. Holbrook & Fessenden & E. H. Thomas) of the superiority of their press, that they intend shortly to manufacture them for sale, of various sizes, suitable for newspapers or other work. They have our best wishes for success, as the public must necessarily be benefitted by every additional facility provided for the diffusion of knowledge.—*Brattleboro Reporter.*

Horticulture.—The Philadelphia Aurora introduces an account of the late meeting of the Philadelphia Horticultural Society, with the following judicious remarks on the importance of a good garden:—We take the opportunity, on placing before our readers an account of the proceedings of a late meeting of the Horticultural Society, to say a few words in behalf of this meritorious institution. Travellers and residents of observation, have remarked the want of attention in the interior of the United States, to horticulture and gardening generally. This is a great blemish, besides being a serious loss. A house, having a productive, handsome garden attached to it, will bring twenty or twenty-five per cent. more rent than one without a garden, and the property is that much more valuable. Apply this to the whole State, and see the importance of horticulture, even in a pecuniary point of view, and, in addition, we may have the luxuries of delicious fruits and vegetables.

Worcester Canal.—The inhabitants of Worcester and vicinity have derived but little benefit from the open state of the canal during the mild weather of the last fortnight, although they had hundreds of tons freight, which they were anxious to get up. The reason is, that all the boats now on the canal, can be more profitably employed in doing the business of the lower end of the route. We hope our citizens will take measures to have a regular line of boats from this place early in the spring.—*Worcester Spy.*

It is found in South Carolina, that a species of "Hemp," similar to the Manilla, but rather more silky in appearance, can be obtained from the plant Okra, which abounds in that state.

Wanted Immediately,

Six or eight Journeyman Chair Makers, at the Newburyport Chair Factory.—Cash and the highest price given.—Apply to Nathan Haskell, Agent for the Proprietors. Newburyport, Dec. 19, 1832.

Winter Keeping for Horses in the vicinity of Boston,

Where the most faithful care may be relied on, may be had on application to Major Samuel Jaques, Charlestown, or Mr. T. J. Niles, School Street, or to Mr. Russell, Publisher of the New England Farmer. An early application is desirable.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.

Orchard Grass Seed.

A few more bushels of this valuable Grass Seed, growth of 1832. Also, Lucerne, White Clover, Fowl Meadow, and every other kind of Grass cultivated in New England.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for us.—For sale by the lb. or ounce. Shallops for fall planting, Tree and Potato Onions.

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the *Rheum Undulatum*, or Tart Rhubarb, or Pie Plant, an excellent article for summer use. (See N. E. Farmer, vol. VI. page 290, and page 11 of this volume, and Fessenden's New American Gardener, article *Rhubarb*, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts. per root.

Seed Potatoes.

A few bushels La Plata or Long Red Potatoes, raised by Mr. Gargus of Weston; selected for seed, of a uniform size, and much improved as to their earliness, by the careful attention of Mr. G. For sale at the

New England Farmer Seed Store,
No. 52 North Market Street—Boston.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1837.

Field Peas.

A consignment of 50 bushels of Field Peas, from Vermont, of the growth of 1837, in good order. They will be sold by the tierce at \$1.75 per bushel.

Oat Meal, &c.

Fine Oat meal and Oat Flour, Hulled Oats, Hulled Barley, Barley Flour, &c. for sale by the barrel or less quantity, direct from Stevens' Mills, Vermont.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts. a paper. They were gathered by a gentleman familiarly acquainted with the sorts, expressly for us. They will be sold by the single paper, or packed to order, in any quantity.

Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

New England Farmer Seed Store,

No. 52 North Market Street—Boston.

MISCELLANIES.

THE INDEPENDENT FARMER.

BY T. G. FESSENDEN.

It may very truly be said

That his is a noble vocation,
Whose industry leads him to spread
About him a little Creation.

He lives independent of all
Except th' Omnipotent Donor;
Has always enough at his call,
And more is a plague to its owner.

He works with his hands, it is true,
But happiness dwells with employment,
And he who has nothing to do
Has nothing by way of enjoyment.

His labors are mere exercise,
Which saves him from pains and physicians;
Then, Farmers, you truly may prize
Your own as the best of conditions.

From competence, shar'd with content,
Since all true felicity springs,
The life of a Farmer is blest
With more real bliss than a king's.

Dr. Walcott, better known as Peter Pindar, had for a time, a most violent cough, when his friend, Dr. Geach, persisted in recommending asses' milk as a certain cure. The bard, tired of his importunities, at length quieted him by sending the following epigram—

And Doctor do you really think
That asses' milk I ought to drink?
'T would quite remove my cough, you say,
And drive my old complaints away.
It cured yourself—I grant it true;
But then—I was *mother's* milk to you.

Thomas Fuller, the historian, so well known for his quaint sayings and bright points, was one day riding with a gentleman named Sparrowhawk.—The name roused his fancy, and he asked him what was the difference between "a Sparrowhawk and an owl?" "Why, sir," replied his companion, "the owl is *fuller* in the head, *fuller* in the body, and *fuller all over*."

Profitable ingenuity.—Two sweep boys wishing to go over Waterloo bridge, and having only a penny between them, determined to cheat the collector, by one getting into the sack, and his companion to carry him across on his back. They tossed which should be bagged, and the loser in a few minutes was on his companion's back, and passed through the gate as a bag of soot. The trick was discovered by a Bow-street parol, who communicated it to the gate-keeper, and he having followed the boys, they confessed that it was for the want of a penny that had caused them to "bilk the gate." The crowd immediately entered into a little subscription, and in a short time a few shillings were raised and given to the sweeps, who appeared not a little pleased at the issue of their comical incident.

From the New York Advertiser.

NEWSPAPERS IN ENGLAND.

In London newspapers an advertisement making ten lines, amounts to five dollars and ninety-four cents for three insertions. In a New York paper the price is only eighty-seven cents.

The price of a daily London newspaper is seven pence sterling, which is about thirteen cents. The papers are sold by agents, who are the only persons known to the proprietors as their customers. This class of persons are respectable men, and in

many instances possess considerable property.—They have sub-agents or carriers, in number proportioned to the extent of their business. It is this class, (the carriers) who make their appearance at the various daily offices, at the hours of publication, and, the moment the papers are received from the press, purchase them at the counting house of the office, paying in ready money for the number they take. The papers are sold to these agents or carriers at the original price of seven pence sterling a paper by the quire; but to enable them to make a living by their business, the office counts out to them *twenty-seven* sheets to the quire, thus giving them three papers above the nominal number, as their profit for selling on the quire.

All these carriers have their routes for each daily as well as semi-weekly and weekly papers marked out, and beyond those limits they consider themselves as having no right to pass, each confining himself to his own district.

The moment the carriers obtain their papers, they go off at full speed, for the various public places in their respective districts, from whence the hundreds of public coaches, morning and evening, depart for all parts of the kingdom. Here they beset the passengers with "Buy the Times, sir,"—"Buy the World, madam,"—"Buy Life in London, miss," &c. in all keys, from the coarse, dissonant note of the old man, to the firm voice of the middle aged, and the treble tones of the youth. Others are besetting the strangers in other quarters, who are about to leave the metropolis by packets and steamboats. These carriers, by way of inducement for persons to purchase, often give a brief summary of the most interesting contents of their respective papers, all claiming that their journal contains the most authentic accounts, the very latest news, the fullest particulars—no matter whether it be a battle in Turkey in which 50,000 men have been slain—a most diabolical conspiracy discovered in Cato-street, in West End, or a trial in a court of law.

Other carriers are trudging their round among their customers, who pay for the paper on delivery; or, if they be well known and well established, receive a limited credit.

Notwithstanding the daily selling of papers is more or less precarious, yet these agents not unfrequently grow rich by their business, and, to show how they acquire their wealth, we must be permitted to tell the story. For instance, the paper is sold on Monday, to Mr. Goodfellow, the proprietor of the Goose and Gridiron, in St. Paul's Church-yard, for seven pence; he wants it but a day; and on Tuesday he sells it to the carrier for four pence—the carrier, (by contract) furnishes it to a second or third-rate house, at the price of sixpence—buys it again on Wednesday, for three pence, and furnishes it to some small victualling-house the same day for four pence—buys it again on Thursday for two pence, and sells it on Friday for three pence, to some low place of entertainment—on Saturday he gets it for a penny half-penny, and then despatches it to the country at half the original price of the paper, where it is read by dozens. It is in this way that the agents make their money, and in this way only that thousands of persons in England get the reading of newspapers, which they could not otherwise enjoy, were they under the necessity of paying full price. For, be it remembered, the habit is not there as it is here, we mean the habit of borrow-

ing. In the ordinary public houses, but one, and in others better supported, two of the daily, and perhaps one weekly paper are taken; and it is not uncommon for the proprietors to advertise it on a sign in front of their houses—such for instance as "The Times taken in here," or "The Morning Post, and British Traveller taken in here." At these houses, to prevent any difficulties, the nicest etiquette is observed. Whoever first makes his appearance asks for the paper, and to him it belongs for the first reading; the person who asks for it next, receives it in his turn; the paper being handed to the waiter by the person who first read it, the moment the has finished: and in this way it passes from one to the other in regular succession.

Regarding the routes or districts which each carrier has for selling papers, it may not be amiss here to state, that such a district is considered as much his property, as though he possessed a fee simple right in it. Others will not dare to interfere with his rights. These districts, if known to be good ones, often sell for a large sum of money. This, however, is not so singular; as it is a fact, which is said to be well authenticated, that beggars in London have frequently been known to sell their right to beg in particular districts.

Reporters. The persons employed as reporters, are, generally speaking, men of fine talents, but many of them are of dissipated habits. It is astonishing to learn the facility which they acquire, by habit and necessity, of taking down the debates in Parliament, or dressing up a story of any kind for the press. During the sitting of Parliament is their harvest. In the capacity of reporters a place is assigned them in the gallery; and standing or sitting together, should a sentence escape one of them, he turns an eye to the reporter next him, and takes it from his minutes. They continue to sketch the debate till relieved by other reporters, attached to the same office, when they hurry off, and correct their minutes at the office, place the copy into the hands of the compositor, and present themselves again in the house, to relieve their substitutes. Other reporters attend to the various courts, police offices, &c. gathering the occurrences of the day or night.

In a dry time, when little foreign news is stirring, the most trivial circumstances are worked up, by their superior talents, aided by fancy and fiction, to affairs of dreadful note, and always with a heading calculated to arrest attention; such as a "Most unparalleled murder!"—"Extraordinary disclosure!"—"Frightful accident!"—"Unprecedented cruelty!"—"Wonderful escape!"—"Horrid affair!"—and "Most extraordinary leap!" &c. &c. An excellent story is told of an occurrence before a police magistrate, which the magistrate never heard of before he read it in the papers. Accidents and hair-breadth escapes are coined by dozens; and instances of the shocking barbarity, acts of great liberality, and astonishing feats are performed with wonderful liberality, each story being written according to the peculiar mood in which the reporter may be in at the moment.

Gunpowder, &c.

Du Pont's Gun Powder, at 25 to 50 cts per pound. Shot Balls Flints and Percussion Caps.

Also, Alum Refined Salt Petre Blue Vitriol, &c. constantly for sale at the *Dupont Powder Store*, No. 65 Broad street—By E. COPELAND, Jr.

[The Du Pont sold as above, is warranted first quality—and is marked "E. Copeland, jr. Boston," on the head of the cask.]

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

BARLEY.

MR FESSENDEN—I received the inclosed from Dr BRADFORD, some time since, as you will see by the date of his letter, and intended you should have had it for publication much sooner, but was desirous of showing it to some of my agricultural friends, which has caused the delay; when it is considered that Dr BRADFORD is concerned in an extensive brewery, and very competent to investigate and determine the quality of barley, it cannot be doubted the publication of his letter will tend to induce cultivators to give their attention to the subject. The Barley, Wheat, and Rye, which I raised this year was ordinary, the kernels much shrivelled, the barley weighing only forty-one pounds per bushel; much of this may be imputed to the season, which was unfavorable for every kind of grain (Indian corn only excepted) in my neighborhood, but a large part of the failure, I am inclined to think, was owing to the quality of the seed.

Your friend and humble servant,

GORHAM LARSONS.

Brighton, Dec. 24, 1828.

DEAR SIR—You may remember, some time since, a conversation respecting barley, and that you then observed that any information on the subject would be put in a proper train for reaching those interested in the improvement of agriculture. The following extract from an article on Brewing, written by Professor THOMSON, contains many things that I think should be known to farmers, since it is evidently for their interest to cultivate a valuable, instead of an indifferent article.

"Barley is the seed of the *Hordeum vulgare*, a plant which has been cultivated from time immemorial, chiefly for the manufacture of beer.—There are two species of *Hordeum* under cultivation in Britain; 1st. The *Hordeum vulgare*, or barley, in which the seeds are disposed in two rows on the spike. This is the species usually cultivated in England and in the southern parts of Scotland. 2d. The *Hordeum hexastichon*, called in the South of Scotland *bear*, and in Aberdeenshire, *big*. In this species the grains are disposed in two rows as in the other; but these seeds spring from the same point, so that the head of big appears to have the seeds disposed in six rows. Big is a much more hardy plant than barley and ripens more rapidly. Hence it thrives better than barley in cold and high situations.—On this account it is sown in preference in the Highlands and northern parts of Scotland, where the climate is colder than more to the south. We have been assured that there is a third species of *Hordeum* cultivated in Scotland, in which the seeds in the spike are arranged in four rows. To this the term *bear* is exclusively confined by some. We have not, ourselves, had an opportunity of examining this species, nor do we find it noticed by botanists. The trivial name *tetrastichon* might be applied to it.

The grains of barley are much larger than those of big, and the cuticle which covers them is thinner. Indeed the thickness of the skin of barley

itself varies according to the heat of the climate in which it is cultivated, being always the thinner, the warmer the climate.

The specific gravity of barley is rather greater than that of big. The average weight of a Winchester bushel of barley, was found to be 50.7 lbs. avoirdupois, and the average weight of the bushel of big 46.383 lbs. The heaviest barley tried weighed 52.265 lbs. per bushel, and the heaviest big 48.586 lbs. This big grew in Perthshire, and the season was peculiarly favorable. It was not absolutely free from a mixture of barley, as was ascertained by sowing a quantity of it—but the proportion of barley was very small. The average weight of a grain of barley is 0.6688 of a grain or nearly two. The average weight of a grain of big is 0.5613 of a grain. The average length of a grain of barley from many thousand admeasurements is 0.345 of an inch, while that of a grain of big is 0.3245 of an inch. The average breadth of a grain of barley is 0.145 of an inch, while the average breadth of a grain of big is 0.136 inch. The average thickness of a grain of barley is 0.1125 inch, while that of a grain of big is 0.1055 inch. Thus we perceive that the grain of big is smaller than the grain of barley in all its dimensions.

To determine the relative weight of the skins of barley and big, we made choice of three parcels of grain, all excellent in their kinds, namely, Norfolk barley—Haddington barley, and Lanark big. The weight of the whole grain and of the skins of each of these is as follows.

	Weight of a corn in grains.	
Norfolk barley	"	0.6809
Haddington barley	"	0.7120
Lanark big	"	0.5408
	Weight of skin in grains.	
Norfolk barley	"	0.110 or 1-6
Haddington barley	"	0.123 or 1-6
Lanark big	"	0.125 or 1-5

From this we see that there is little difference between the weight of the skin of Norfolk and Haddington barley; but a very considerable one between Haddington barley and Lanark big.—Hence it would seem that this difference is not owing to the climate in which the barley vegetates, but rather to a difference in the nature of the species. The bulks of these two species of grain are to each other as follows.

Barley 0.00217 inch.

Big 0.001777 inch.

These quantities represent the average bulk of a corn of each kind. Thus it appears that a grain of barley is rather more than 1-6th part larger than a grain of big.

Finally, from a comparison of many thousand corns of each species with each other it appears that the inequality between the size of different grains of big is greater than between different grains of barley. Indeed if we examine an ear of big when nearly ripe, we shall perceive that the corns towards the bottom of the ear, are smaller than those towards the summit and about the middle of the ear. Several of those towards the bottom are usually abortive or consist only of skin, but this is not always the case. In an ear of bar-

ley, on the contrary, we shall find almost all the grains nearly of a size, though in some cases, the grain constituting the upper termination of the spike is rather smaller than the rest.

These circumstances may strike the reader as too minute and trifling to be stated in such detail, but we shall find afterwards, that they will furnish us with an explanation of some anomalous circumstances that occur when these two species of *hordeum* are converted into malt. The value of barley, (or its produce in alcohol) is rather improved, while big on the contrary, is deteriorated in malting it at least 20 per cent."

Such are the remarks of Professor THOMSON, and they are founded on very careful experiments. My own opportunities of making similar experiments and acquiring similar information respecting the barley of this country, have been too limited to speak at much length concerning the matter. As far as I have been able to ascertain, there are four species cultivated, namely—

1st. The *Hordeum vulgare*, or true English barley. This agrees with Professor Thomson's description, and is the most valuable, though unfortunately the least common species. It is known by the name of *two-rowed* barley. A bushel of this species well cleaned, will, as I am informed, for I have not been fortunate enough to procure such a sample, weigh from 50 to 51 pounds.

2d. The *Hordeum tetrastichon*, or bear. The corns of this species when removed from the spike, resemble those of the first species—indeed it is commonly considered as the same. On a close examination they will be found to differ in two or three particulars—the skin is thicker, the beard harder and stronger, and the back of the corn is marked by a stronger ridge along the centre—it is not so valuable as the former species, weighing from 47 to 50 lbs. only. It is called *two-rowed* barley like the last, but incorrectly since it grows in four rows, and the ear when growing is thus easily distinguished from that of the true *two-rowed* barley.

3d. The *Hordeum hexastichon*, or big—commonly known to our farmers, I believe, by the name of French or *four-rowed* barley. It grows as asserted by Thomson, in six rows, or rather two rows, of which each is divided into three. It answers his description very well, and is an inferior grain—seldom weighing more than 46 lb. and often not 44 lbs. Unfortunately for the brewers it is a common variety.

4th. The naked, or ball, or potatoe barley, for I have heard it called by all these names, I have never happened to see, and know nothing of its comparative value.

I cannot but think that it would be for the interest of the farmer to cultivate the former of these in our warm climate to the exclusion of the others, certainly to the exclusion of the third species, or big, since it would command a much higher price. It would even be a great improvement in our agricultural system, if farmers would take pains to prepare for the market, parcels of any one of these species by itself. As it is they are always mixed; the consequence is that when the barley or bear predominates, the big malt, which is unprofitable enough at any rate, must be rendered

still less valuable, by being kept on the floor long enough for the barley to come forward. It is thus sacrificed, or spent, or if the big be treated fairly, as in those cases in which it constitutes the largest portion of the parcel. The other portion, namely, the barley or bear, being grains of slower growth, must be dried before they are half malted.

With great respect,
your obed't serv't,

Boston, Oct. 1828. GAM. BRADFORD.

AGRICULTURE.

The following article was written for the *Conversations-Lexicon, a Popular Encyclopedia, translated from the German, with Corrections and Large Additions*, edited by Dr FRANCIS LIEBER, and soon to be published by Carey, Lea & Carey, Philadelphia. By the Editor of the New England Farmer.

Agriculture is the art of cultivating the earth in such a manner as to cause it to produce in the greatest plenty and perfection, those vegetables which are useful to man, and to the animals which he has subjected to his dominion. This art is the basis of all other arts, and in all countries coeval with the first dawn of civilization. Without agriculture mankind would be savages, sparsely scattered through interminable forests, with no other habitations than caverns, hollow trees, or huts more rude and inconvenient than the most ordinary hovel or cattle-shed of the modern cultivator. It is the most universal as well as the most ancient of the arts, and requires the greatest number of operators. It employs seven-eighths, and feeds the whole mass of population of almost every civilized community. Agriculture is not only indispensable to the prosperity of a nation at large, but is eminently conducive to the welfare of those who are engaged in its pursuits. It gives health to the body, energy to the mind, is favorable to virtuous and temperate habits—that knowledge and purity of moral character, which are the pillars of good government, and the only supporters of national independence, which can be relied on in the hour of danger.

With regard to the history of agriculture, slight sketches only can be given in a work, which, like the present, professes rather to present general outlines than minute delineations of the subjects, which it brings to view. The first notices, which history has afforded of agriculture, are found in the writings of Moses. From them we learn that Cain was a "tiller of the ground," that Abel sacrificed the "firstlings of his flock," and that Noah "began to be a husbandman and planted a vineyard." The Chinese, Japanese, Chaldeans, Egyptians and Phœnicians appear to have held husbandry in high estimation. The Egyptians were so sensible of the blessings resulting from that art, that they ascribed its invention to superhuman agency; and even carried their gratitude to such superstitions and absurd excess as to worship the ox, as a tribute due to the animal for his services as a laborer. The Carthaginians cultivated the science, and carried the art of agriculture to a higher degree than other nations their contemporaries. Mago, one of their most famous generals, wrote no less than twenty-eight books on agricultural topics, which, according to Columella, were translated into Latin, by an express decree of the Roman Senate.

Hesiod, a Greek writer, supposed to be contemporary with Homer, wrote a poem on agriculture, entitled "Weeks and Days," which was so denominated because husbandry requires an exact

observance of times and seasons. Other Greek writers wrote on rural economy, and Xenophon among the number, but their works have been lost in the lapse of ages.

The implements of Grecian Agriculture were very few and simple. Those mentioned by Hesiod are a plough, consisting of three parts, the share-beam the draught-pole and the plough-tail; but antiquarians are not agreed as to the exact form of the implement. A cart with low wheels, and ten spans (seven feet six inches) in width.—The rake, sickle and ox-goad are mentioned, but no description is given of the mode in which they were constructed. The operations of Grecian culture according to Hesiod were neither numerous nor complicated. The ground received three ploughings, one in autumn, another in spring, and a third immediately before sowing the seed. Manures were applied, and by Pliny their invention is ascribed to the Grecian king Augeas. Theophrastus mentions six different species of manures, and adds that a mixture of soils produces the same effect as manures. Clay, he observed, should be mixed with sand, and sand with clay. Seed was sown by hand, and covered with a rake. Grain was reaped with a sickle, bound in sheaves, threshed, then winnowed by wind, laid in chests, bins, or granaries, and taken out as wanted by the family, to be pounded in mortars or quernmills into meal.

The ancient Romans venerated the plough, and in the earliest and purest times of the Republic, the greatest praise which could be given to an illustrious character was to say that he was an industrious and judicious husbandman. M. Cato, the censor, who was celebrated as a statesman, orator and general, having conquered nations, and governed provinces, derived his highest and most durable honours from having written a voluminous work on agriculture. In the *Georgics* of Virgil the majesty of verse and the harmony of numbers add dignity and grace to the most useful of all topics. Columella, who has been celebrated as a writer, flourished in the reign of the emperor Claudius, and wrote twelve books on husbandry, which constituted a complete treatise on rural affairs. Varro, Pliny, and Palladius were likewise among the distinguished Romans, who wrote on agricultural subjects.

With regard to the Roman implements of agriculture, we learn that they used a great many, but their particular forms and uses are so imperfectly described that very little is known concerning them. From what we can ascertain respecting them, they appear more worthy of the notice of the curious antiquarian than the practical cultivator. The plough, the most important implement of agriculture, is mentioned by Cato as of two kinds, one for strong, the other for light soils.—Varro mentions one with two mould boards, with which, he says, "when they plough, after sowing the seed, they are said to ridge." Pliny mentions a plough with one mould board, and others with a coulter, of which, he says there are many kinds.

Fallowing was a practice rarely deviated from by the Romans. In most cases a fallow and a year's crop succeeded each other. Manure was collected from nearly or quite as many sources as have been resorted to by the moderns. Pigeon's dung was esteemed of the greatest value, and next to that a mixture of night soil, scrapings of the streets and urine, which were applied to the roots of the vine and olive.

The Romans did not bind their corn into sheaves. When cut it was sent directly to the area to be threshed, and was separated from the chaff by throwing it from one part of the floor to the other. Feeding down grain when too luxuriant was practised. Virgil says, "What commendation shall I give to him, who, lest his corn should lodge, pastures it while young, as soon as the blade equals the furrow. *Geor. lib. 1, l. 111.* Watering on a large scale was applied both to arable and grass lands. Virgil advises to "bring down the waters of a river upon the sown corn, and when the field is parched, and the plants drying, convey it from the brow of a hill in channels." *Geo. lib. 1, l. 106.*

The farm management most approved of by the scientific husbandmen of Rome, was, in general, such as would meet the approbation of modern cultivators. The importance of thorough tillage is illustrated by the following apologue. "A vine dresser had two daughters and a vineyard; when his oldest daughter was married he gave her a third of his vineyard for a portion; notwithstanding which he had the same quantity of fruit as formerly. When his youngest daughter was married, he gave her half of what remained, still the produce of his vineyard was undiminished."—This result was the consequence of his bestowing as much labour on the third part left after his daughter had received their portions, as he had been accustomed to give to the whole vineyard.

The Romans, unlike most conquerors, instead of despoiling improved the countries which they subdued. "To benefit mankind and increase their comfort and happiness seemed to be the invariable wishes of the Roman commanders. They seldom or never burned or laid waste the country which they conquered, but rather strained every nerve to civilize its inhabitants, and introduce the arts necessary for promoting their comfort and happiness. To facilitate communications from one district or town to another seems to have been a primary object of the Romans, and the works of this kind, accomplished by them, are still discernible in numerous places. By employing their troops in this way, when not engaged in more active service, their commanders seem to have had greatly the advantage over our modern generals. Instead of suffering their soldiers to loiter in camps, or riot in towns, and thus enervate their strength and relax their morals, the Roman commanders kept their soldiers regularly at work, and what was still better, at work on objects highly beneficial to the interests of those whom they subjugated."

In the ages of anarchy and barbarism which succeeded the fall of the Roman empire, agriculture was almost wholly abandoned. Pasturage was preferred to tillage, and the reason for such preference consisted in the facility with which sheep, oxen, &c. can be driven away or concealed on the approach of an enemy.

The conquest of England by the Normans contributed to the improvement of agriculture in Great Britain. By that event many thousands of husbandmen from the fertile and well cultivated plains of Flanders, and Normandy, settled in Great Britain, obtained farms and employed the same methods in cultivating them which they had been accustomed to use in their native countries.—Some of the Norman barons were great improvers of their lands, and were celebrated in history for their skill in agriculture. The Norman clergy,

and especially the monks, were still greater improvers than the nobility. The monks of every monastery retained such of their lands as lay most convenient to their own possessions, which they cultivated with great care under their own inspection, and frequently with their own hands. The famous Thomas Becket, after he was archbishop of Canterbury used to go out into the field with the monks of the monastery where he happened to reside, and join with them in reaping their corn and making their hay. The implements of agriculture in this period, were similar to those in most common use in modern times. The various operations of husbandry, such as manuring, ploughing, sowing, harrowing, reaping, threshing, winnowing, &c. are incidentally mentioned by the writers of those days; but it is impossible, to collect from them a definite account of the manner in which those operations were performed.

The first English treatise on husbandry was published in the reign of Henry VIII. by Sir A. Fitzherbert, Judge of the common pleas. It is entitled *The Book of Husbandry*, and contains directions for draining, clearing and enclosing a farm, and for enriching and reducing the soil to tillage. Lime, marl and fallowing are strongly recommended. "The author of *The Book of Husbandry*," says Mr. Loudon, "writes from his own experience of more than forty years, and if we except his biblical allusions, and some vestiges of the superstition of the Roman writers about the influence of the moon, there is very little of his work which should be omitted, and not a great deal that need be added, in so far as respects the culture of corn, in a manual of husbandry adapted to the present time."

Agriculture attained some eminence during the reign of Elizabeth. The principal writers of that period were Tusser, Googe, and Sir Hugh Platt. Tusser's *Five Hundred Points of Husbandry* was published in 1562, and has been recommended to be taught in schools. The treatise of Barnaby Googe, entitled *Whole Art of Husbandry*, was printed in 1558. Sir Hugh Platt's work was entitled *Jewel Houses of Art and Nature*, and was printed in 1594. In the former work, says Loudon, are many valuable hints on the progress of husbandry in the early part of the reign of Elizabeth. Among other curious things he asserts that the Spanish or Merino sheep was originally derived from England.

Several writers on agriculture appeared in England during the Commonwealth, whose names, and notices of their works may be seen in London's *Encyclopedia of Agriculture*. From the restoration down to the middle of the eighteenth century very little improvement took place. Immediately after that period a considerable melioration in the process of culture was introduced by Jethro Tull, a gentleman of Berkshire, who began to drill wheat and other crops about the year 1701, and whose *Horse-oeing Husbandry* was published in 1731. Though this writer's theories were in some respects erroneous, yet, even his errors were of service by exciting inquiry, and calling the attention of husbandmen to important objects. His hostility to manures, and attempting in all cases to substitute additional tillage in their place, were prominent defects in his system.

(To be continued.)

Maj. A. Perkins has printed for 127 Banks, the bills of which, it is said, have never been successfully counterfeited.

From the Sandy Hill Sun.

CULTURE OF HEMP.

In republishing from the Franklin Telegraph the following article on the culture and cleaning of Hemp, it is proper to remark: that though much credit is due to the writer for his voluminous and useful compilation of facts, still he is mistaken in the belief that hemp will not grow, "or grows but feebly on sandy or gravelly land;" and that its culture is alone confined to low or "moist soils." That "sandy or gravelly lands" may be profitably devoted to the culture of hemp, if they be naturally rich, or made so by manure or plaster, many of the farmers of this county and Saratoga can certify from actual experiment. Hemp, it is most clear, like all other crops, is produced more abundantly on strong or fertile lands: and it is equally clear that there is nothing in the soil itself peculiarly adapted to the culture of this article. Much, however, depends on the season, in the production of different soils of the same strength and state of cultivation. It is an axiom among farmers that their uplands, of equal richness produce corn, wheat, potatoes, &c. more luxuriantly in cold and wet seasons, than their bottom or lowlands; and that the latter produce best in dry and hot seasons. The same remark is also applicable to the hemp crop, as experiment has abundantly demonstrated. Last season, it will be recollected, was unusually wet in this section of the country, and while the "sandy and gravelly lands" produced a fine growth of hemp and of a good quality, the alluvial, or "moist soils," produced "but feebly." In our last number we gave satisfactory evidence, it is believed, of the erroneousness of the opinion which had so generally obtained, of hemp being an extremely exhausting crop. And we hope soon to see exploded the equally unfounded but too generally accredited notion that low lands or "moist soils," are alone adapted to the culture of this new but profitable crop to the American farmer. One other position assumed by the writer in the Telegraph, it might not be improper to notice. The ploughing of land early in the fall, if it be sward or stubble ground, is considered by him as indispensable in preparing it for the reception of the seed for a good crop of hemp. This, too, must be mere matter of opinion with the writer, and not founded in experiment, the correctness of which we very much doubt. Last season we were interested in planting for seed about four hundred acres of hemp, and nearly that number of acres which were sown broad cast for the lint; and we can state that the greater part of the whole was on green sward land, turned over in the months of May and June at the time of planting and sowing the seed—some of which was put in as late as the last of June or first of July. And ploughing, the turf was left smooth and compact by means of a roller; and harrowed lengthwise of the furrows until sufficiently mellow for the working of the drill. And we have no hesitancy in saying that our crops from late sowing and planting on lands thus prepared, were equal and in some cases preferable, to those put in earlier and on lands prepared in the manner advised by the Telegraph writer. From experiment therefore, as well as information derived from our most experienced and intelligent farmers, we are fully prepared to say, that there is no precise and invariable rule to be observed in fitting land for a hemp crop, as it must be done well—the surface

should be rendered smooth and mellow; and while some lands will require to be ploughed and harrowed three or four times to subdue them properly, others will be better prepared by the first or second operation. No matter whether the process be begun in the fall or the spring, provided it be completed before the sowing or the planting of the seed. As regards the time for sowing and planting: this must depend entirely on the state or condition of the land, in reference to its dryness and warmth—say between the first of May and 4th of July.

Hemp, is capable of being cultivated in almost all climates; but flourishes best and is most valuable in northern latitudes. It requires a strong moist soil; and grows but feebly on sandy or gravelly lands. The rich soils of this region seem peculiarly adapted to it; as any one may have observed its luxuriant growth where it has accidentally been sown.

Like flax it exhausts the soil; but successive crops can without difficulty be raised, if manure be plentifully used. The better way, however, is to cultivate it in rotation with grasses and grain. The land must be well prepared so that it will be light and free from weeds. Stubble or sward land should be ploughed and harrowed three times; the first early in the fall; then as soon as the frost is out in the spring; and again immediately before putting in the seed. The time for sowing depends upon the state of the soil. It is usually about the time of corn planting. When the object is to procure the seed, it is sown in drills about three feet apart. Soon after the plant is up, it is dressed like Indian corn, with an instrument called a cultivator or horse shoe. When ripe it is cut or pulled, dried and threshed, and the stem affords a coarse lint for cordage. But when cultured for manufacture solely, two bushels should be sown, broadcast, upon the acre, and carefully covered, to prevent the birds from plundering it. The hemp is cut with a cradle about the time the seeds begin to fill, at which time the leaves turn white. It is then bound up in small bundles, and set up in the field like grain. It was formerly rotted on the ground, in the way farmers now prepare flax for bleaching. But this is a dilatory and expensive method, and greatly injures the material for manufacture. The "water rot" was afterwards substituted as an improvement, and is still practised in Europe.

By this process the hemp is taken to pits of standing water, and immersed four or five days, when it is taken out and spread on the ground for three or four weeks—care being taken to turn it often to prevent the mildew or insects from destroying the fibre. This process is also tedious and precarious in bad weather. The hemp was then dressed in the ordinary method of dressing flax.

A great improvement, however, has lately been introduced into the business. The new hemp and flax machine supersedes the necessity of rotting before breaking. When the stem is sufficiently dried, in the field or kiln, to render the woody substance brittle, it is run through the breaking machine, which consists of a succession of fluted rollers, which operate upon every part of the stem several hundred times, with sufficient force and velocity to break and dislodge it from the lint. The glutinous vegetable matter with a portion of the shives still adheres to the lint; to separate which, the hemp is sunk into running or standing

water from three to five days, according to the temperature. It is then dried by a few hours' exposure to the sun, and again passed through the machine, which frees it from the remaining shives, and leaves it in a fine flexible state.

This improvement not only saves more than half the expense and waste in manufacturing hemp, but secures it from the injury which it unavoidably sustains by the rotting system. Too much labor has heretofore been requisite in producing this article, so that our farmers could not compete with Europeans, who obtain labor so much cheaper; but now that labor-saving machine and our tariff give him a double advantage. If our government continues to extend the protecting hand to our own productions and manufactures, the growing of hemp and flax will soon become a branch of business to the northern agriculturists."

RUSSIA.

The American Quarterly Review reckons the population of Russia at between 50 and 60 millions of souls, of whom about 40 millions are serfs, (white slaves employed in husbandry.) The number of serfs belonging to the crown is 14 millions. The serfs are not sold in Russia as slaves are sold in the United States, but they are bonded to the land; they form a part of the glebe, and can only be made over to another as a part of the estate. On some estates, they are allowed to work three days in the week on their own account; the other three days they work for their lord. When the government wants recruits for the army, each person holding serfs is directed to send his quota of peasants, suitably equipped, to a particular spot. The serfs settle it among themselves who are to march. The friends of the recruits bewail their fate in the most lamentable manner, and take an everlasting farewell of their children, brothers and relations. They seldom see or hear from them again. Few furloughs are given to Russian soldiers; their distance from home renders visits impossible; they cannot send letters to their friends, being unable to read or write; and most of them fall in battle or by natural death before the expiration of their 25 years' service. The pay of the poor soldier is not more than 55 cents a month. Capt. Jones, in his Russian Tour, estimates the Russian army at 800,000 men, of whom not more than half are efficient for field duties. The Cossacks usually send 40 or 50,000 cavalry into the field in time of war.—*Hamp. Gaz.*

The New Zealand Spinage is certainly a great addition to our list of culinary vegetables. We have given the method of cultivation recommended in New York. Having it under cultivation two seasons, we are enabled to speak of it from our own observation, and we certainly concur in the encomiums bestowed on it. In a subsequent number, and in time for those to benefit by it, who may wish to cultivate it, we will give our experience on the subject.—*Southern Agriculturalist.*

Souvenirs, Tokens, &c.—Seven or eight Souvenirs, or Annuaries, have been published within the last two months, each of which contains, *probably* ten, *possibly* twenty, pages of excellent composition; the remainder, if it were sent in manuscript to the editors who praise it, would not be admitted into the columns of their respective papers. Anything, paid for such blank verse and "blanker prose," must be extravagant.—*Boston Courier.*

BRITISH IRON TRADE.

By a statement in a late English paper, it appears that nearly 700,000 tons of iron are made every year in Great Britain—valued at 6,297,000 pounds sterling. In making this estimate of the value of the trade, the writer merely takes into account the coarser kinds of the article. Undoubtedly the finer manufactures of Sheffield and Birmingham, if added to the above, would greatly swell the amount. This immense sum is derived, it is affirmed, from the minerals of Great Britain alone—no foreign ingredient whatever being employed in the manufacture—and, what is equally creditable to the character of the iron trade of that country, almost the whole amount of the money thus obtained, is distributed among the artisans engaged in that business.—*Boston Bulletin.*

From the New York Evening Post.

HORTICULTURAL SOCIETIES.

We are glad to observe that these useful institutions are multiplying over the country, and that now the political storm is over, the activity and zeal of our citizens are turned to the improvement of husbandry. A meeting of gentlemen from the several counties of Onondaga, Cayuga, Seneca, Tompkins, Ontario, Wayne, Yates, Monroe, Livingston, and Genesee, has lately been held at Geneva, for the purpose of forming a "Domestic Horticultural Society for the Western part of the State of New York." The vice-presidents and committee of managers are selected, one from each of these counties. Myron Holly delivered a discourse, previous to the organization of the society, which will be published. The officers of the society have been chosen from among gentlemen of the highest respectability in that part of the state. The Geneva Gazette, speaking of the institution, says—

"The countenance which this society has received in its origin, from men of acknowledged acquirements and of extensive influence, gives an earnest of success, cheering to its projectors, and which promises lasting benefits to this section of our state. A project, so honorable in its character, so laudable in its object, and so auspicious in its commencement, cannot fail of final and complete success."

CHEMICAL EXPERIMENT.

A new Fire-Screen for the Ladies.—Draw a landscape on paper with common Italian ink, representing a winter scene, or mere outline; the foliage to be painted with muriate of cobalt, (green,) muriate of copper, (yellow,) and acetate of cobalt, (blue,) all which colors dry in invisible; but on the screen being held near the fire, the gentle warmth will occasion the trees, flowers, &c. to display themselves in their natural colors, and winter is magically changed to spring. As the paper cools, the colors disappear; and the effect may be repeated as often as desired.

Our countrymen sometimes leave potatoes as legacies to the nations whom they visit. Mr Bogle brought them to Tibet, and in that country they are called "Eogles." The Hindoos regard them as the best boon bestowed upon them by the English. Sir John Malcolm introduced them into the garden at Bushire, and now they are abundant on the coast of the Persian Gulf, and distinguished by the name of "Malcolm's Firm."

WOBURN ACADEMY.

On Wednesday the 3d inst. the academy in Woburn was opened, and the handsome edifice dedicated by appropriate services, commencing by an anthem. The dedicatory prayer was made by Rev. Mr Bennet; an appropriate address was delivered by Rev. Dr Fay, of Charlestown, in which he gave a concise account of the original design in the establishment of the Institution; last prayer by Rev. Mr Mallory; an anthem concluded the services. It is intended by the Trustees, and the Preceptor, that nothing on their part shall be wanting, to make this institution equal to any in our highly favored land; especially for instruction in such branches of education as may qualify for active business, as well as in sound literature, and the moral and religious cultivation of the mind.—Instead of a gymnastic establishment, it is contemplated that the students shall have a far more healthful and useful exercise, by occupying a small portion of their time in labor, either in a garden, (there being several acres of land attached to the Institution for that purpose,) or at some mechanical work in a shop already provided.—*Bost. Rec. & Tel.*

Impostor.—An impious wretch has recently appeared in Ohio, who declares that he is Jesus Christ, and that he has come to judge the world. He has about 20 crazy followers, who worship him, prostrating themselves at his feet, and calling him God. Some of them were formerly considered respectable citizens. One man knowing the injury he had done to his followers, gave him a thrashing, and drove him out of the place. A few sound drubbings will doubtless divest him of his pretended omnipotence.—*Id.*

Flour and grain have advanced a little in New York. On Friday last flour was sold from \$7 75 to 8 25 per barrel; wheat 1 62 per bushel; rye 0 67. In 1827 the wheat received by the canal was 1,290,552 bushels; this year it has been only 555,902 bushels—decrease 724,650 bushels.—Supplies of wheat come in freely from the south.

Large Crop.—From two bushels and two thirds of a bushel of potatoes, planted by Lt. Timothy Eaton, of East Pond Plantation, this season, he had the astonishing product of one hundred and thirty bushels.

Extraordinary Vegetable Production.—A Cabbage which grew at the farm of Mr Shubrick, on the neck, was this morning (Dec. 4) brought to this office; it measures in circumference between 40 and fifty inches—and is as large a vegetable of its kind, in size, as was perhaps ever seen.—*Charleston Patriot.*

Losses in New York by Fires.—Mr Jameson Cox has presented the City Council of New York an estimate of the losses by fire during eleven months of the present year, 1828—which amount to the enormous sum of six hundred and eighty thousand dollars.—*N. E. Palladium.*

The coffers of the Bank of England are stated to contain gold to the amount of thirteen millions of pounds.

So great is the vintage the present year in some parts of France, that it is stated in many villages the vintners will give two hogsheads of wine for an empty cask.

FLOODING OF LANDS.

Where swamp land is to be cleared, and it can be flooded, by making a dam at the outlet, at a small expense, it is a matter of economy to attend to this, as in this way its growth of wood can be completely killed. This may also be performed on lands, after they are cleared, for the purpose of killing the grass, if it be bad, in order with more ease to introduce a better kind, or a better system of culture. Flooding also serves, in a greater or a less degree, to enrich the land; though this depends chiefly on the kind of water with which it is flooded. If it contain a rich sediment, it is good; but, if destitute of this, it is of no use.—*Farmer's Assistant.*

GROVES.

These are both ornamental and useful. To plant heights of ground, the sides and tops of which are generally not very good for tillage or pasture, adds much to the beauty of a landscape; and is at the same time highly useful, as it regards the quantities of firewood which may be produced from such spots. Planting rows of trees along highways is also pleasant for shade to the traveller, and profitable to the owner of the soil. The same may be observed, in regard to lanes, and to passages from the highway to the mansion-house. Sugar-maple trees, planted round the borders of meadows, and some straggling ones in them, are very pleasant and profitable, as they do no injury to the growth of the grass. Wherever trees can be planted in pastures and along fences, without doing injury to the growths of the adjoining fields by their shade, this part of rural economy ought never to be omitted.

The shade of some kinds of trees is much more hurtful to the growth of plants than others.

"I planted Indian Corn (says Mr Livingston) on the west side of a young wood, consisting of oaks, poplars, a few chestnuts, and a large mulberry somewhat advanced into the field. The shade made by the rising sun extended nearly across the field, and was not entirely off until about ten o'clock. I remarked that, as far as the shade of the chestnut reached, the corn was extremely injured; it was yellow and small. The conical shape of the morning shade from particular trees might be traced a considerable extent, in the sickly appearance of the plants. The black oaks were likewise injurious; but less so than the chestnuts; the poplars, very little so. Near the mulberry tree, the corn was covered by its shade for a long time every morning; and, though not so large as that which had more sun, maintained a healthy appearance."

The shade of the black oak is particularly hurtful to the growth of wheat; that of the locust is, on the contrary, beneficial to grass-grounds; and that of the sugar-maple does but little injury to the growth of grain, and none to grass.—*Farmer's Assistant.*

HILLS AND VALLEYS.

It is found that more rain falls in the valleys than on the hills. The reason of this is, that in the valleys the drops of rain having farther to fall, of course come in contact with, and absorb more of, that vapor with which even the driest atmosphere abounds.

If a goblet filled with cold water be set in a warm atmosphere, this vapor will presently adhere to its sides in the form of water; and in the same

way it adheres to the drops of water in their descent.

In this, as in everything else, the wisdom of the Creator is displayed. The temperature of the valleys being warmer than that of the hills, more moisture is required and more is given them. Hence, too, the reason why many plants, which require much heat, grow best in valleys: they have the requisite degree of heat, and at the same time a proportionate degree of moisture. But as all grasses which are indigenous require only the heat of the hills, they grow as well on them as in the valleys: a good general rule, therefore, is, *the valleys for tillage, and the hills for pastures.*

Two other good reasons for this are: Firstly, when hills are kept in tillage, they are generally more or less washed by the heavy rains, by which much of the best soil is carried off; and secondly, they are always more or less inconvenient for ploughing, and generally still more difficult for carrying any heavy manures upon them. The above rule, however, is not to be applied to hills of large extent and moderate descent; it is, in strictness, merely applicable to broken hills and declivities.—*Farmer's Assistant.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY DEC. 26, 1828.

ON THE PRESERVATION AND REPAIR OF ROADS.

A friend, who resides in Maine, has requested us to republish from London's Encyclopedia of Agriculture, an article on the use of *broad wheels* in carriages, for preserving roads much travelled on. This we do with much pleasure, as we know of few subjects of more general interest.

The preservation of a road depends in a great measure on the description of machines and animals which pass over it, and of keeping it dry and free from dust and mud. The repairs of a road should commence immediately after it is finished, and consist in obliterating vats the moment they appear, filling up any hollows, breaking any loose stones, and correcting any other defect.—After cleaning and this sort of repair have gone on hand in hand, for a longer or shorter period, according to the nature of the materials, and traffic of the road, a thorough repair or surface-renewal may be wanted, of three or more inches in thickness, over the whole of the road. [*Some remarks on Broad Wheels in our next.*]

FOR THE NEW ENGLAND FARMER.

DOMESTIC COOKERY.

MR FESSENDEN—I am a constant reader of your excellent paper, and often see articles of a tendency to suppress intemperance. This is as it should be; but there is a kind of intemperance to which I would call your attention—viz. Introducing ardent spirits into domestic cookery. I have been a house keeper for nearly thirty years, and can say with confidence, from my own experience, there is not the *least* need of using spirits in any kind of cooking. Intemperate *eating* is said to be as hurtful as intemperate *drinking*. No wonder, when, in addition to high seasoning, is often added large quantities of *brandy* and wine. It is no uncommon thing to see, in a receipt, for instance, for making mince pie, "to one pound of meat add *one quart* of brandy, and, *one quart* of wine!" These together with the great quantity

of *spices*, &c, are enough to destroy the tone of almost any stomach. How often do we hear people say, "I can't eat any mince pie—my stomach won't bear it,"—whereas, if properly made, almost any stomach could bear it. It would be nutritious, innocent. I hope while there are improvements making so universally, this important branch of domestic economy, and I may add, domestic *temperance*, will not be neglected.

Keene, N. H. Dec. 23, 1828. A MOTHER.

FOR THE NEW ENGLAND FARMER.

MR FESSENDEN—I noticed in one of your numbers last summer, a description of a method of telling a horse's age, which I did not thoroughly understand; and I should be grateful to any person who would explain it a little more satisfactorily. I am happy to find that the horses sent here by Admiral Coffin have met, with the favor they deserve. Some time in the next spring, I will endeavor to give a very short, but more complete account of the causes of foot-lameness; and to rectify any mistakes I may perceive in my previous communication. I am surprised to find that I omitted high feeding as one of its exciting causes. However, I did not intend to give much more than an account of what is now conceived to be the disease.

Portsmouth, N. H.

J. L. ELWYN.

FATTENING CALVES.

In order to make calves fine and fat, the best and most efficacious way is, to keep them as clean as possible, by elevating the coops in such a manner that the sun may not have too great power over them, and to such a height above the level of the ground, that their urine may pass off; by giving them fresh litter every day, and suspending over the coop a large chalk-stone, so that they can easily lick it. Besides this, it is usual to bleed them when they are about a month old, and again just before they are slaughtered; which practice contributes in a considerable degree to the beauty and whiteness of the flesh, and is therefore more frequently repeated by some persons, [in England] but this is not altogether necessary; twice bleeding being fully sufficient for that purpose, in the opinion of the most experienced breeders. It is however, to be observed that those calves, which are intended for bulls, or for oxen, should be selected as soon as possible; as the operation necessary to make them oxen should not be deferred till the calves are more than twenty days old.

Willich.

CANDLES.

When tallow is very dirty or rancid, an ounce of pearl ash to about ten pounds of tallow, put into the water wherein the tallow is melted, is of service. In such candlesticks as are not made to slide, the candles are frequently permitted to burn in the socket, to great waste, and to the injury of the candlestick. This may be prevented by taking out early the short piece of candle, placing it between three common pins, stuck in an old cork, and putting the cork in the candlestick. A pound of candles, ten to the pound, will give a greater quantity of light, by one fourth, than a pound of six to the pound; because the tallow is more perfectly consumed, in consequence of a greater surface of wick being exposed to the air. In large wicks the tallow is not burned, but distilled away.

Cooper.

DEEP PLOUGHING.

Deep ploughing may be a very profitable practice in a rich soil; and in a fertile, shallow soil, situated upon cold clay or sandy subsoil it may be extremely prejudicial. A shallow soil, however, may be rendered deeper by degrees, ploughing up a small quantity of barren earth at a time, and manuring plentifully.

FOOD FOR PLANTS.

Water, and the decomposing animal and vegetable matter existing in the soil, constitute the true nourishment of plants; and as the earthy parts of the soil are useful in retaining water, so as to supply it in the proper proportions to the roots of the vegetables, so they are likewise efficacious in producing the proper distribution of the animal or vegetable matter; when equally mixed with it they prevent it from decomposing too rapidly; and by their means the soluble parts are supplied in proper proportions.

SOILS ABSORBING MOISTURE.

I have compared the absorbent powers of many soils with respect to atmospheric moisture, and I have always found it greatest in the most fertile soils; so that it affords one method of judging of the productiveness of land.—*Agricultural Chemistry.*

POTATOES IMPORTED.

In 1827, 20,892 bushels of potatoes were imported into the United States from the British dominions; but the exports of American potatoes in that year to England and her dependencies were only two bushels. This, however, is the less to be wondered at, when we reflect that the climate of Great Britain, Ireland, Canada, and Nova Scotia, being more moist and cool than that of the United States, is better adapted to the culture of potatoes.

NICETY IN MAKING CIDER.

An English writer says, "In some places apples are split, and two kinds of cider made; that with the red side being of a superior quality to what the whole apple would make."

TO MAKE VERY STRONG VINEGAR.

An European author asserts that, "Cider (particularly such as is of an acid tendency,) placed in the sun, becomes vinegar in a short time; and one pound of honey to a gallon of cider will, after standing some months, become such strong vinegar that it must be mixed with water for common use."

ENTOMOLOGY.

A new animal or plant is seldom to be met with, even by those who have leisure and opportunity for extensive researches; but if you collect insects, you will find, however limited the maner upon which you can pursue your game, that your efforts are rewarded by the capture of some new-descript or rarity at present not possessed by other entomologists, for I have seldom seen a cabinet so meagre as not to possess unique specimens. Nay, though you may have searched every spot in your neighborhood this year, turned over every stone, shaken every bush or tree, and fished every pool, you will not have exhausted its insect productions. Do the same to another and another, and new treasures will still continue to enrich your cabinet. If you leave your own vicinity for an entomological excursion, your prospects of success are still

farther increased; and even if confined in bad weather to your inn, the windows of your apartment, as I have often experienced, will add to your stock. If a sudden shower obliges you at any time to seek shelter under a tree, your attention will be attracted, and the tedium of our station relieved, where the botanist could not hope to find even a new lichen or moss, by the appearance of several insects, driven there, perhaps by the same cause as yourself, that you have not observed before. Should you, as I trust you will, feel a desire to attend to the manners and economy of insects, and become ambitious of making discoveries in this part of entomological science. I can assure you from long experience, that you will here find an inexhaustible fund of novelty. For more than twenty years my attention has been directed to them, and during most of my summer walks my eyes have been employed in observing their ways; yet I can say with truth, that so far from having exhausted the subject, within the last six months I have witnessed more interesting facts respecting their history, than in many preceding years. To follow only the insects that frequent your own garden, from their first to their last state, and to trace all their proceedings, would supply an interesting amusement for the remainder of your life, and at its close you would leave much to be done by your successor; for where we know thoroughly the history of one insect, there are hundreds concerning which we have ascertained little besides the bare fact of their existence.

Kirby & Spence.

USES OF THE BEECH TREE.

The leaves of the Beech, gathered in autumn, before they are much injured by the frost, make infinitely better mattresses than straw or chaff, and endure for seven or eight years. It is unparalleled in water works, for when constantly kept wet, it appears as perfectly sound at 40 years end, as when first immersed. [It rots very quick, however, in fences, or other situations in which it is exposed to changes from wet to dry.]

The wood is formed into tool-handles, planes, chairs, bedsteads, spokes, bowls, large screws, &c. The felloes of the London carts are made of it, because it tears with more difficulty than even ash.

It is excellent fuel, and when burnt it affords a large quantity of potash.

The mast, seeds or nuts yield a good oil for lamps: swine are fond of them, but their fat is soft, and boils away, unless hardened before they are killed, by some other food. They have been toasted as a succedaneum for coffee.

The hulls of the seed's are collected by the poor for winter firing. The tree bears lopping, and may be trained to form very lofty hedges.—*Gleanings on Husbandry.*

Cure for Warts.—Procure sixpence worth of muriat of iron, sufficient to cure any number of warts, which may be had of any of the druggists, and touch the wart with the liquid three or four times a day, for two or three weeks, with the feather of a quill made very small at the end, so as to discharge a drop at a time, and let it dry in. If the wart should be an old one, it would be more speedily cured by shaving off with a sharp pen-knife a little of the rough outside skin, not, however, so as to make it bleed, but just sufficient to make the surface a little tender.—*Am. Sentinel.*

STATISTICS.

In the notice of the work of M. BALBI, called "*The Political Balance of the Globe*," which we find in the *Journal des Debats* of the 27th September, the following tables are extracted, purporting to show the power and resources of the principal nations of the civilized world, as compared with their respective population:

Proportion between the amount of Revenue and Population.

United Kingdom of Great Britain and Ireland, for each inhabitant, about	\$13 00
France, - - - - -	6 00
Netherlands, - - - - -	5 1-5
Prussian Monarchy, - - - - -	3 1-2
United States of America, - - - - -	2 2-5
Empire of Austria, - - - - -	2 1-10
Empire of Russia, excluding Poland, - - - - -	1 1-5

Proportion between the amount of Debt and Population.

United Kingdom of Great Britain and Ireland, for each inhabitant, about	\$174 00
Netherlands, - - - - -	127 00
France, - - - - -	29 00
Austria, - - - - -	9 00
United States of America, - - - - -	7 00
Prussia, - - - - -	5 9-10
Russia, excluding Poland, - - - - -	4 1-12

Proportion between the Army and the Population.

Russia, without Poland, one soldier for every	57
Prussia, - - - - -	80
Austria, - - - - -	118
France, - - - - -	138
Netherlands, - - - - -	142
Great Britain and Ireland, - - - - -	229
United States of America, - - - - -	1977

Proportion of the Naval Force to the Population.

Great Britain and Ireland, one line of battle ship or frigate, to	82,979
Sweden and Norway, - - - - -	154,640
Netherlands, - - - - -	170,566
France, - - - - -	299,909
United States of America, - - - - -	316,000
Russia, without Poland, - - - - -	760,000
Austria, - - - - -	2,909,091

This is a curious, and not uninteresting view of the various powers enumerated; and if the same accuracy be evinced with regard to the other calculations, which is exhibited in those relating to the United States, it must be deemed authentic.

From the United States Gazette.

COMMUNICATION.

Gentlemen—Herewith I send you an extract from late English papers, which may be interesting to some of your readers, and which you can publish when you have room for it.

A Coffee Drinker.

Coffee.—The discovery of coffee is generally attributed to the Prior of a monastery in that part of Arabia where the shrub is indigenous.—The fact of the case, however, as verified by the learned Addalender, whose manuscript is in the King of France's library, and by Mr Galland, translator of the Arabian Tales, are as follows:—

About the middle of the fifteenth century, one Gemaleddin, who resided at Aden near the

mouth of the Red sea, having occasion to travel into Persia found there some of his countrymen, who were in the habit of taking coffee, and who were loud in the praise of its virtues. On his return to Aden, he was cured from sickness by the use of coffee. As Mufti of Aden, and having occasion to pass whole nights in prayer, Gemaiddin persuaded the Dervishes, the better to fit them for watching, to make use of coffee. In a short time there was no beverage in Aden, so popular as coffee; lawyers took it to stimulate their faculties; mechanics and artists to invigorate their bodies; travellers to aid them to prosecute their journey by night; in short, all Aden took it. From Aden it passed to Mecca, where it became in a short time, if possible, still more popular. From Arabia Felix it was carried into Egypt, thence to Syria, and finally to Constantinople.

BRIGHTON CATTLE MARKET.

We have received from an obliging correspondent, the following view of this great market, from the 29th September, to the 1st December.

SOLD AT BRIGHTON.

1828.	Cattle.	sheep.	Swine.
September 29,	1750	4000	1000
October 6,	1374	4257	1227
“ 13,	1660	2062	200
“ 20,	1500	4000	400
“ 27,	2300	5172	100
November 3,	3054	4400	2000
“ 10,	3003	4500	600
“ 17,	3500	4000	700
“ 24,	2200	3000	1000
December 1,	1200	4000	900

AGGREGATES.

21,546 Cattle, average value \$25 each,	\$538,953
39,391 Sheep, “ “ \$1.50 do.	59,746
8,127 Swine, “ “ \$4.00 do.	28,508

68,504 Total, 626,904

Our correspondent adds,—“The cattle have been unusually large and good, exceeding that of any former season. The sales for the *best cattle* have been dull, in consequence of the large number in the market. *Barreling cattle* have commanded better prices than for some years past.”—*Bost. Cent.*

We have received a sample of sugar, refined in London, from the maple sugar of Canada. It is certainly equal to any of the refined sugar imported for sale into this country. We have not the means of ascertaining what quantity of maple sugar is manufactured annually in this province, but we have reason to believe it is considerable.—*York, U. C. paper.*

We have been shown the prospectus of a plan for forming an association to be called the ‘Erie and Ontario Transportation Company,’ with a capital of \$130,000, for effecting the transportation of produce and merchandize from any designated port on lake Erie, through the Welland Canal, to Prescott, and from thence to Montreal, or to Oswego, and from thence to New York—and *vice versa.*—*ib.*

Such is the mildness of the season to the South, that Okra was in blossom on the 4th of Dec. in several gardens in Charleston.

A specimen of the growth of native *Ginger*, has been left with us by Mr Raiford, who has raised it successfully for four years past, on common land, and exposed to all the variations of our climate. That in our office, was planted in February last, is now in full vigor and luxuriance, and in a few weeks will ripen. From several experiments made in its culture on a small scale, it might, it is thought, be made a profitable article, considering the demand for it.—*Savannah Georgian.*

Mr JOSEPH W. CAPRON, of Attleborough, raised the last season, from 130 square rods of land, 75 bushels Potatoes and 20 bushels Indian Corn. A small orchard on the same land yielded between 30 and 40 bushels apples.

We are informed that Col J. Hare Powell, of Pennsylvania, has sent by the ship Helen Mar, Capt. Harrison, a young Bull, from a full bred Chinese cow, by a celebrated Durham short horn. This valuable animal is considered to be particularly well adapted to endure a Southern climate, and has been presented to Dr Tidyman by that distinguished and zealous agriculturist, Col. Powell, who has evinced more liberality in benefiting the cause of agriculture, than any individual in the United States. The public are much indebted to this gentleman for the persevering and successful effort he has made to promote the breed of cattle and sheep. We have reason to rejoice at the continued improvements which are making in every branch of agriculture through the United States.—*Char. Cour.*

Oil stone.—This valuable stone, of a quality superior to the Turkish Oil Stone, has been discovered in Hocking county, Ohio.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Field Peas.

A consignment of 50 bushels of Field Peas, from Vermont, of the growth of 1827, in good order. They will be sold by the tierce at \$1.75 per bushel.

Oat Meal, &c.

Fine Oat meal and Oat Flour, Hulled Oats, Hulled Barley, Barley Flour, &c. for sale by the barrel or less quantity, direct from Stevens' Mills, Vermont.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts. a paper. They were gathered by a gentleman familiarly acquainted with the sorts, expressly for us. They will be sold by the single paper, or packed to order, in any quantity.

Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.

Orchard Grass Seed.

A few more bushels of this valuable Grass Seed, growth of 1826. Also, Lucerne, White Clover, Fowl Meadow, and every

other kind of Grass cultivated in New England.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for us—For sale by the lb. or ounce.

Shallots for fall planting, Tree and Potato Onions.

Tangier Cauliflower.

We have just received through Mr Malony, the American Consul at Tangier, a few lbs. of this celebrated Cauliflower seed. A small parcel was sent to the Hon. Jonathan Huswell of this city, a few years since, who pronounces it altogether superior to any seed from England, and which produced cauliflowers much finer than any he had seen cultivated in this country.

Thorn Quicks for Hedges.

A few thousand Buckthorns and Hawthorns. The latter were imported from Glasgow last spring, and are in fine order for transplanting, \$5.00 per thousand, 75 cents per hundred. We are now filling up an order for Georgetown, (D. C.) for several thousands of the *American Thorn*, which will be delivered here at \$5 per thousand for seedlings; \$6 for plants two years old. Persons in want of this valuable thorn for live hedges are desired to transmit their orders soon.

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the *Rheum Undulatum*, or Tart Rhubarb, or Pie-Plant, an excellent article for summer use. (See N. E. Farmer, vol. vi. page 290, and page 11 of this volume, and Fessenden's New American Gardener, article *Rhubarb*, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts. per root.

Seed Potatoes.

A few bushels La Plata or Long Red Potatoes, raised by Mr Gourgas of Weston; selected for seed, of a uniform size, and much improved as to their earliness, by the careful attention of Mr G. For sale at the

New England Farmer Seed Store,

No. 52 North Market, Street—Boston.

MISCELLANIES.

Egotism.—Those people who have nothing else in them are, generally, full of themselves.

A good man is a useful man.—The blessings of education, wealth, rank, leisure, authority, and reputation, are granted to a few, that they may employ them for the good of the whole community; so that those who labor may have no cause to reproach those who do not work with their hands for being drones, and a useless burthen to the community.

Responsibility of men of talents.—When a talent is given to any one, an account is opened with the great GIVER, who appoints a day in which he will arrive and redemand his own with usury.

Success and its consequences.—Prosperity, which hardens weak souls, softens generous hearts; and nothing can be more gentle than a hero after victory.

Poverty and Knavery.—The poorer a man is, the more necessity there is for his being honest. A rich knave may, perhaps, prosper for a time in worldly affairs; but a poor knave will soon have as little credit as cash, and will not only suffer but deserve all the evils, which covetousness can inflict.

A queer mistake.—When the late Admiral Crosby was dining with Col. Fitzgerald, at Merriam-square, London, he happened to lay his huge brown fist upon the table; at that moment Dr Jenkins, who was very short sighted, casting his eyes around the table in search of a loaf of bread, happened to rest them on the Admiral's fist; and mistaking it for a loaf, thrust his fork plump into it. The Admiral smarting with the wound, said in a rage, "don't trouble yourself to reach—I'll help you," and raised the same fist to demolish the doctor. The doctor perceiving his mistake, cried out, "only a slice, sir, it won't go round." This disarmed the Admiral of his wrath, and so convulsed the company with laughter, that all the dyspeptic cases at table were discontinued.

Fontenelle.—At the close of a fine summer's day, Fontenelle was discovered by a friend reclining on the sunny side of a hill, contemplating a flock of sheep, which, anxious for the arrival of their shepherd, kept bleating. "Why so melancholy, sir?" inquired his friend, "ruminating, no doubt, on human vicissitudes and ———." "You are very right," said the amiable philosopher, interrupting him; "I am examining that noisy flock before us, and I am just saying to myself—that among them 200 sheep, it is very probable there is not to be found one tender shoulder of mutton!" —*London Weekly Review.*

Cobbett on Early Education.—"I have just now put my French Grammar into the hands of my youngest son, who is 14 years and a half old—that being about the age that I think it best for boys to begin to read books; and as to girls, they will always begin soon enough, if you suffer any books to be in the house. I have no opinion of settling little creatures down to pore over printed letters, before it is possible for them to understand any reason which you give for anything. The first thing in my mind, is to do your best to cause them to have healthy bodies; then, as soon as they can

reason, they will have sound minds, learn anything you put before them, and they will, in a trice, overtake the little masters that have been perched upon a form from three years old to fourteen."

In 1697, the corporation of New York ordered lights to be placed in their windows, during the dark time of the moon. At this time, the city contained 6090 inhabitants, 600 of whom depended upon *bolting* for a living. At a subsequent period, in the same year, it was ordered that every seventh house hang out a pole with a lantern, to light the streets.

In 1757, Staten Island was sold by the Indians to the Dutch, for 10 shirts, 20 pairs of stockings, 10 guns, 30 bars lead, 30 lbs. powder, 12 coats, 2 pieces duffil, 30 kettles, 50 hatchets, 25 hoes, and a number of knives and awls.—Two years after, the Indians complained that the terms of the sale had not been complied with, and the Dutch were obliged to add more trinkets, when the island was formally delivered to Thomas Lovelace and Mathias Nichols.—*New York Gazette.*

The Catskill Republican of the 26th ult. says that more than three thousand firkins of butter, made principally in Delaware county, came into that village in one day. Schoharie has sent a vast quantity of wheat this season, to the same place. Toast, we imagine, will be plenty in Catskill this year. Will old Berkshire send them some cheese to eat with it?

"A Salt River Roarer."—One of those two-fisted back-woodsmen, "half horse, half alligator, and a little touch of the snapping turtle," went lately to see a caravan of wild beasts. After giving them a careful examination, "he offered to bet the owner," says the Western Mercury, "that he could whip his lion in an open ring; and he might throw in all his monkeys, and let the zebra kick him occasionally during the fight!"

Indigo.—It is proposed to revive the cultivation of Indigo in Florida. Formerly much was produced there, which was only rivalled by that of the Caraccas. In former times, nearly \$480,000 were paid in London, in one year for Florida Indigo.

The first Paper Mill in England, was erected at Dartford, by a German, in 1588, who was knighted by Elizabeth; but it was not before 1713, that a stationer, one Thomas Wathers, brought the art of paper making to any perfection.

A nectarine scion, inserted in a peach stock, on the farm of Mr W. Elliot, of Northford, Conn. grew five feet six inches the last season, handsomely proportioned, with fine thrifty branches.

Old proverb.—"He who whistles much has an empty head."

We learn, says the Williamstown Advocate, that all the merchants in six towns in Berkshire county, have determined to retail no more ardent spirit.

Large orders for silks have been received from America at Lyons and St Etienne.

Cobbett.—This extraordinary man alluding to the number of his "works," observes—"If any young man wish to know the grand secret relative to the performance of such wondrous labor, it is told him in a few words—he abstinent—he sober—go to bed at eight o'clock and get up at four—the last two being of still more importance than the two former. A full half of all that I have ever written, has been written before ten o'clock in the day; so that I have had as much leisure as any man I ever knew any thing of. If young men will but set about the thing in earnest, let them not fear of success; they will soon find that it is disagreeable to set up, or to rise late. Literary coxcombs talk of "consuming the midnight oil." No oil, and a very small portion of candles, have I ever consumed, and I am quite convinced, that no writing is so good as that which comes from under the light of the sun.

The merchants in Boston have come to a resolution to decline in future to give a discharge to their debtors, either in Boston or in the country, for less than one hundred cents on a dollar, in case of loss by fire, unless their property is insured to near the amount of its value.

A new State Prison, in the vicinity of Westchester, N. Y. has just been completed. It is built of white marble, is 482½ feet long, 44 broad, 4 stories high, and contains 800 cells.

From the year 1821 to 1825 inclusive, the value of silk goods imported into the U. States, was upwards of thirty-five millions of dollars. Nothing is wanting but proper attention paid to the subject to enable the inhabitants of the U. States not only to supply domestic consumption with this costly article, but to export it.

SUBSCRIPTION

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of this culture into the United States.

Mr Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordeaux, Clerac, and Bazet, departments of Gironde and Lot and Garonne, in France, (15° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1828.

Mr A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50.—Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 1000; and 18 cents for less than 50 roots. Payment to be made on delivery of the roots. Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Loubat, 85 Wall street; Boston, E. Copeland, Jr.—Albany, R. M'Michael—Philadelphia, Van Amringe—Baltimore, Willard Rhoads—Washington City, Wm. Pairo. Richmond, Davenport, Allen & Co. Savannah, Hall, Shapter & Tupper—New Orleans, Foster & Hutton—Charleston, (S. C.) J. & J. Street & Co. Mr A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal booksellers of the United States; and his agents will furnish them gratis to subscribers. ID12.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VII.

BOSTON, FRIDAY, JANUARY 2, 1829.

No. 24.

AGRICULTURE.

AGRICULTURE.

Written for the *Conversation-Lexicon*, by the Editor of the *New England Farmer*.

(Continued from page 179.)

After the time of Tull's publication, no great alteration in British agriculture took place, till Robert Bakewell and others carried into effect some important improvements in the breeds of cattle, sheep, and swine. These resulted in great benefits to British agriculture and emolument as well as fame to those who effected the alteration. By Bakewell's skilful selection at first, and constant care afterwards to breed from the best animals, he at last obtained a variety of sheep, which, for early maturity, and the property of returning a great produce of mutton for the food, which they consume, as well as the small proportion, which the weight of the offal bears to the four quarters, were without precedent. Culley, Cline, Lord Somerville, Sir J. S. Sebright, Darwin, Hunt, Hunter, Young, &c. &c. have all contributed to the improvement of domestic animals, and have left little to be desired in that branch of rural economy. Among other publications of distinguished merit, on agricultural topics, may be numbered *The Farmer's Letters, Tour in France, Annals of Agriculture*, &c. &c. by the celebrated Arthur Young; Marshall's numerous and excellent works, commenced with *Minutes of Agriculture*, published in 1787, and ended with his *Review of the Agricultural Reports*, in 1816, *Practical Agriculture*, by Dr R. W. Dickson, &c. &c. The names of Kaimes, Anderson, Sinclair, are also rendered illustrious by publications, which exhibit a union of philosophical sagacity, and patient experiment, resulting in improvements of incalculable importance not only to the British nation but to the human race. To these we shall only add the name of John Loudon, F. L. S. H. S. whose elaborate and able works, entitled *Encyclopedia of Gardening* and *Encyclopedia of Agriculture*, have probably never been surpassed by any similar works in any language, age, or country.

The establishment of a National Board of Agriculture was of pre-eminent service to British husbandry. Hartlib, a century before, and Lord Kaimes, in his *Gentleman Farmer*, had pointed out the utility of such an establishment, but it was left to Sir John Sinclair to carry their ideas into execution. To the indefatigable exertions of that worthy and eminent character the British public are indebted for an institution, whose services can hardly be sufficiently appreciated. "It made farmers who reside in different parts of the kingdom acquainted with one another; and caused a rapid dissemination of knowledge amongst the whole profession. The art of agriculture was brought into fashion; old practices were amended, new ones introduced, and a degree of exertion manifested, which had never before been exemplified in this island."

AGRICULTURE OF FRANCE.

French agriculture began to flourish in the beginning of the seventeenth century, under Henry IV. and a work on that subject was published by

Olivier de Serres. In 1761 there were thirteen agricultural societies established in France, and nineteen co-operating societies. Those of Paris, Amiens, and Bourdeaux have distinguished themselves by their published memoirs. Du Hamel and Buffon caused the study of rural economy to become fashionable, and other writers contributed to the advancement of husbandry. M. de Trudine introduced the Merino breed of sheep in 1776, and Comte Lasteyrie has written a valuable work on sheep-husbandry. The celebrated Arthur Young made an agricultural survey of France in 1787, 8, and 9. Since that time several French and English writers have given the statistics and culture of different districts, and the Abbe Rosier and Professor Thouin general views of the whole kingdom. Buonaparte established many new agricultural societies and professorships, botanic and economical gardens for the exhibition of different modes of culture, and the dissemination of plants. He also greatly enlarged and enriched that extensive institution, the National Garden, whose Professor of culture, the Chevalier Thouin, is one of the most scientific agriculturists in Europe.

The lands in France are not generally enclosed and subdivided by hedges or other fences. Some fences occur near towns, but, in general the whole country is open; the boundaries of estates being marked by slight ditches or ridges, with occasional stones or heaps of earth, rows of trees or scattering trees. Depredations from passengers on the high ways are prevented by *gardes champetre*, which are established throughout all France.

Since the time of Colbert the French have paid a good share of attention to sheep, and there are considerable flocks of Merino sheep owned by individuals, besides the national flocks. That of Rambouillet, established in 1786, is, or lately has been managed by M. Tessier, an eminent writer on agriculture. Sheep are generally housed, or kept in folds, and little yards and enclosures.

Mr Birkbeck considers the practice of housing or confining sheep as the cause of foot rot, a disease very common among sheep in France.—Where flocks remain out all night, the shepherd sleeps in a small thatched hut, or portable ware house placed on wheels. He guides the flock by walking before them, and his dog guards the sheep from wolves, which still abound in some parts of the country. In the south part of France, the ass, and the mule are of frequent use in husbandry. A royal stud of Arabian horses has been kept up at Aurillac, in Limousin, for more than a century, and another has been more recently established near Nismes. Poultry is an important article in French husbandry. Mr Birkbeck thinks that the consumption of poultry in towns may be equal to that of mutton. The breed of swine is, in general, bad; but fine hams are made in Bretagne from hogs reared on acorns, and fattened with Indian corn. The French implements of agriculture are generally rude and unwieldy, and the operations of husbandry unskilfully performed.

The vine is cultivated in France in fields, and on terraced hills, but managed differently in that country from its common culture. In France

vines are planted in hills, like Indian corn, kept low, and cultivated like a plantation of raspberries. The white mulberry tree is very extensively cultivated for feeding the silk-worm. It is not placed in regular plantations, but in corners, rows, by the sides of roads, &c. The trees are raised from seeds in nurseries, and sold, generally, at five years' growth, when they have strong stems. They are planted, staked, and treated as pollards.

The eggs of the silk worm are hatched in rooms, by means of stoves to 18° of Reaumur (72½ Fahr.) One ounce of eggs requires one hundred weight of leaves, and will produce from seven to nine pounds of raw silk. The hatching commences about the end of April, and with the feeding is over in about a month. Second broods are procured in some places. The silk is wound off the cocoons in little balls by women and children. The olive, the fig, the almond, and various other fruits are also extensively cultivated in France.

AGRICULTURE IN GERMANY.

The earliest German writer on husbandry, was Conradus Heesbachius, who lived and died in the 16th century. His work *De Re Rustica* was an avowed compilation from all the authors who had preceded him. No other books on agriculture of any note appeared previous to the seventeenth century. With regard to the present state of agriculture in Germany, we are necessarily limited to brief notices. The country is very extensive and presents a great variety as respects soil, surface, climate, and culture. Its agricultural produce is, for the most part, consumed within its limits, but excellent wines are exported from Hungary and the Rhine, together with flax, hams, geese, silk, &c. The culture of the mulberry, and the rearing of the silk worm is carried on as far north as Berlin. The theoretical agriculturists are well acquainted with all the improved implements of Great Britain, and some of them have been introduced, especially in Holstein, Hanover, and Westphalia; but, in general, their ploughs, wagons, &c. are unhandy, unwieldy, and inefficient. Fish are carefully bred and fattened in some places, especially in Prussia, and poultry is every where attended to and carried to a high degree of luxury at Vienna. The culture of forests likewise receives particular attention in that country as well as in France. The common agriculture of Germany is every where in a state of improvement. Government, as well as individuals have formed institutions for the instructions of youth in its principles and most enlightened practices. The Imperial Society of Vienna, the Geographical Institution at Presburg, and that of Professor Thaer, in Prussia, may be numbered among recent institutions of this description.

AGRICULTURE IN ITALY.

The climate, soil, and surface of Italy are so various as to have given rise to a greater diversity of culture than is to be found in the whole of Europe, besides. Corn, grass, butcher's meat, cheese, butter, rice, silk, cotton, wine, oil, and fruits of all kinds, are all found in perfection in this fertile section of the globe. Loudon asserts that only one-fifth of the surface of Italy is considered ster-

ile, while only a fifth of the surface of France is considered fertile. The population of Italy is greater in proportion to its surface than that of either France or Great Britain.

The writers on the rural economy of Italy, are Arthur Young, in 1788, Sigismundi, in 1801, and Chateaubriand, in 1812.

In Lombardy, the lands are generally farmed by metayers, (from *meta* one half). The landlord pays the taxes and repairs the buildings. The tenant provides cattle, implements and seeds, and the produce is divided. The irrigation of lands in Lombardy is a remarkable feature of Italian husbandry. All canals taken from rivers are the property of the state, and may be carried through any man's land, provided they do not pass through a garden, or within a certain distance of a mansion, on paying the value of the ground occupied. Water is not only employed for grass-lands, which, when fully watered, are mowed four, and sometimes five times a year; and in some cases as early as March, but is conducted between the narrow ridges of corn lands, in the hollows between drilled crops, among vines, or to flood lands, a foot or more in depth, which are sown with rice. Water is also used for depositing a surface mud in some places where it is charged with that material. The details of watering for these and other purposes are given in various works, and collected in those of Professor Re. In general, watered lands let at one third higher price than those not irrigated.

The implements and operations of agriculture in Lombardy, are both very imperfect. The plough is a very rude contrivance, with a handle thirteen or fourteen feet long. But the cattle are fed with extraordinary care. They are tied up in stalls, then bled once or twice, cleaned and rubbed with oil; afterwards combed and brushed twice a day. Their food in summer is clover or other green herbage; in winter a mixture of elm-leaves, clover-hay, and pulverized walnut-cake, over which boiling water is poured, and bran and salt added. In a short time the cattle cast their hair, grow smooth, round and fat, and so improved as to double their value to the butcher.

The tomato or love-apple (*solanum lycopersicum*) so extensively used in Italian cookery, forms an article of field culture near Pompeii, and especially in Sicily, from whence they are sent to Naples, Rome, and several towns on the Mediterranean sea. (To be continued.)

Williams, in his book on West Florida, remarks on the cultivation of Indigo in that country, that Caracas, alone was able to rival Florida, in this article; forty thousand pounds sterling in one year, has been paid in London, for Florida Indigo; yet at this time not a pound is raised in the territory for sale; a few planters cultivate it for the use of their families; yet it is raised with less trouble than any other crop, and any female slave can manufacture it. This plant also is a native of Florida; its natural soil is the Pine Barrens.

Sheep.—A meeting of the citizens of Orange county has been called at Goshen, N. Y. to devise some plan to protect their sheepfolds from the ravages of dogs, the existing laws being insufficient.

Ginger Root.—Mr Raiford, near Savannah, has raised ginger root for the last four years, successfully, on common land, and exposed to all the variations of the climate.

FOR THE NEW ENGLAND FARMER.

INSECTS ON FRUIT TREES.

MR FESSENDEN—Your Pennsylvania correspondent, M, appears to have noticed two distinct insects on the apple-tree, one of which, as Mr Buel remarks, you did not advert to in your Farmer of the 5th instant.* I regret that you overlooked a conjecture hazarded in the memorandum furnished you, the substance of which was, that the "dark colored insect, on the body of the tree, about the size and shape of a small grain of coffee, with a bristly coat, and no wings," might be the *apterous female of a moth*, several species of which (besides that of the canker-worm) are common here.† That this insect had no connexion whatever with the minute muscle-like insects observed on the trees no one can doubt who has read Mr Perley's communication on the bark-louse, a species of *Coccus*, and Mr Loudon's description of the American blight, *ERIOSOMA mali* of Leach, *APHIS Lanata* or *lanigera* of other naturalists.

The account given by M. was not sufficiently detailed and particular to enable us to decide which of these two latter insects his probably was, although it appeared most to resemble the bark-louse of Mr Perley.

It has not yet been ascertained whether our bark-louse is the same as that described by Reaumur and Geoffroy, and observed by Shaw and Kirby on the apple-trees of England; but ours agrees in size and shape with theirs, and it is highly probable, if it is identical, that we are as much indebted to Europeans for introducing this and other lousy complaints, as they are to us for the American blight, which, however, I have never seen. In regard to the introduction of insects, I am fully persuaded that we have no species, in common with those of the Eastern world, which have not accompanied man and his imports from thence.

Perhaps a few general remarks on the economy of the *Coccus* genus may not be unacceptable to some of your readers, and may stimulate them to complete, by careful observation, the history of Mr Perley's species.

Early in the spring the *Cocci* are found apparently torpid, situated longitudinally in regard to the branch, the head upwards, and sticking by their flattened inferior surface closely to the bark. On attempting to remove them they are generally crushed, and there issues from the body a dark colored fluid. By piercing them with a pin they

* We intended, however, to make our remarks applicable to two distinct species of insects. One which was described by "M" as having an appearance which "resembled the blossoms of timothy or some small grass, shaken on the trunk of the tree, when wet with dew, and remaining on it.—After which they appeared to increase in size to about the bigness of shot No. 3 cut in two and a little lengthened; and formed a cover, adhering to the bark, under which the insect, whatever it may be, was found," &c. [See p. 112.] This we supposed might be the bark-louse of Mr Perley; but having doubts on the subject, after describing the Perley insect, we remarked, "The above description of a destructive insect, and the remedy prescribed by Mr Perley, may be of use, although the insect may not be the same with that which has annoyed the fruit trees of our correspondent 'M.'" We then quoted from Kirby and Spence, notices of the *Tinea Corticella*, and *Arborem Linearis*, which we concluded might be identical with the insect first mentioned by "M."

† Having done with this insect we then took up the other on the last column of page 158 as follows, viz:

"The insect described by 'M,' page 142, found on the body of the tree about the size and shape of a small grain of coffee," &c. See also our note p. 169.—EDITOR.

‡ After we had commenced writing the editorial article p. 153, and before we had completed it, the "memorandum" was mislaid, and has not since come to hand. This we regret, as we set a high value on the communications of the author.—ED.

can be made to quit their hold, which I have often seen in the common species of the myrtle, *Coccus Iesperidum*. A little later the body is more swelled, and, on carefully raising it with a knife, numerous eggs of an oblong form will be discovered beneath it, and the insect appears dried up and dead, and forming only a convex cover to its future progeny. Under this protection the young are hatched, and, on the approach of warm weather, make their escape at the lower end of the shell which is slightly elevated at that part. They then move with considerable activity, and disperse themselves over the young shoots or leaves. The shape of the young *coccus* is much like that of its parent, but the body is of a paler color, more thin and flattened. Its six legs and proboscis are visible under a magnifier. Some species are covered with a mealy powder, as in the *C. cacti*, or Cochenille of commerce. These little lice insert their proboscis into the bark and leaves, and draw from the cellular substance the sap which nourishes them. Reaumur observed the ground quite moist under peach-trees infested with *Cocci*, which was caused by the dripping of the sap from the numerous punctures made by these insects. While they continue their exhausting suction of sap they increase in size, and during this time, are in what is called the larvæ state. When this is completed they are still of different magnitudes, and set about their transformation by spinning from the mouth minute whitish filaments, which are affixed in a radiate manner to the bark, and which confine and secure the body in its situation. (Do not these constitute the specks of blue mould noticed by Mr Perley?) They now remain apparently inanimate; but under these lifeless scales the metamorphosis of the insect is conducted; with this remarkable difference, that, in a few days, the large ones contrive to break up and throw off, in 4 or 5 flakes, their former coats, and reappear in a very similar form to that which they before had: the smaller ones, on the contrary, continue under their envelope, which serve as cocoons, and from which they seem to shrink and detach themselves, and then become perfect pupæ, the rudiments of wings, antennæ, feet, &c. being discoverable, on raising the shells. If we follow the progress of these small ones (which are to produce the males) we shall see, in process of time, a pair of filaments and the tips of the wings protruding beneath the shell at its lower elevated part, and, through this little passage, the perfect insect at length backs out. The pupæ coat of the female is never cast off, so far as we can discover, but continues adherent and flexible, and the insect itself never afterwards changes place. The male is exceedingly small in comparison with the female, and is an anomaly in the order, (*Hemiptera*) having only two wings or hemelytra, though Latreille detected, in one species, vestiges of another pair of wings, which resembled the balancers of flies. The tail of the male is furnished with an elongated curved stilet, and a pair of slender, long, filaments. The ovaries of the female are fecundated through the small aperture beneath the lower tip of the shell. After this her body gradually augments, becomes more convex, and when the eggs are matured they are extruded and spread by the contraction of her body beneath its envelope, till the fond mother perishes in her labors, but still shields with her body the eggs which are to give birth to her future offspring.

There are several broods of some species in

the year. Of the bark-louse at least two are produced in one season. It is probable that the females of the last brood are fecundated in autumn, survive the winter, and thus provide for a succession of the species.

The writer of the article on Bees, in the North American Review, was too indiscriminate in denouncing all insects except the favorite elaborators of wax and honey. The single genus *Coccus* affords an ample refutation to the charge of universal noxiousness and inutility. Various tints of red are furnished by them from the splendid *Carmine* of the cochénille, to the duller hues of the *scarlet in grain* and the *Palish coccus*. The resin called *lac* is produced by a species of this genus, and has become essential in the composition of varnishes, japanned ware, and sealing-wax, and by a chemical process a beautiful pigment is obtained from it. The *wax* of China, called *Pe-la* is procured from certain trees, which are stocked, in that country, with *Cocci* for facilitating its production.

No species of *SAPERDA*, inhabiting the apple-tree, is known to us except the common one striped with white and brown, and which proceeds from the well-known *borer*. If there is another appropriated to this tree, we should like to see a description of it, and should be highly gratified to receive specimens.

With respect, your friend and servant,

T. W. HARRIS.

Milton, December 24, 1828.

FOR THE NEW ENGLAND FARMER.

VILLAGE ANECDOTE.

MA EDITOR.—It is encouraging to reflect, that however misled men may be, at times, by passions and prejudices, yet virtuous deeds and generous feelings, directed by a love of justice and peace, have something so amiable in themselves, that they will meet, not only with undisguised and general approbation, but they will create in society a predisposition to the same valuable end, offering thereby a strong assurance, that the human mind was intended by the Almighty Founder, as their native and prosperous soil. Nor is the magnitude of the object which brings those feelings into action, of much consideration; it is altogether the moral principle which gave them birth.—There is in them an irresistible charm to bring forth seeds of life, which otherwise might remain dormant and barren. It seems to be a duty, therefore, and it is a very pleasant one, to record those occurrences. In the present instance, the natural repository is assuredly the New England Farmer, now of general circulation among that order of citizens, within whose ancient and noble avocation is to be found, the safeguard to the best interests of our country. After this short preamble, I will ask your leave to introduce the following anecdote.

Some time since, it was in October, the weather being favorable for clearing land, A. H. determined to burn away the brush in one of his pastures; the fire ran faster than expected, and extended into the wood lot of his neighbor, N. H., where it did considerable damage, before it could be subdued. N. H. was absent on a journey, at the time, and on his return met with A. H., who expressed his regret at the accident which had taken place, and his readiness to satisfy him for the loss. Let us refer the case, said A. H., and

the damages to be assessed, to two men we can trust, and let those men be you and I.

Your proposal, Mr A. H., is very fair; but in such cases two men have been known, at times, not to agree, therefore, I would propose to you, to leave it to one alone, and let that man be your good self. You will take the case into consideration, and when we meet again, you will inform me to what amount you have fixed the loss.—The next time they met, A. H. informed N. H., that he had walked over his wood lot, and, that from the best opinion he could form of the injury it had received, he had estimated the loss at sixty-five dollars. N. H. professed himself perfectly satisfied with the liberal damages, which A. H. had brought in; but, neighbor, said he, it is a hard case, and, therefore, I will propose to you, that we should divide the loss; you pay me one half, and I will bear the rest.

When an anecdote is clothed with that character of pleasantness, which seems to render its truth somewhat questionable, it is often styled a *good story*. In the Italian language the same idea is prettily expressed by *se non è vero, è ben trovato*, which translated, *if it is not true, it is at least well imagined*. But in the present instance there is no fiction. The parties alluded to, are AMOS HARRINGTON, and NATHAN HAGAR, of the Rev. Mr FIELD's parish. Happy the town where hard cases, and all cases, are generally settled under the mild influence of such feelings! Happy the State where such spirit should prevail! Justice, equity, and peace! It would have a tendency to shorten and simplify the work of legislation, and to relieve of part of their labors the ministers of the law; it would hasten the promised and happy period, when the moral Rose is to bloom in the wilderness. J. M. G.

Weston, 29th Dec. 1828.

From the American Farmer.

GRAPES.

Retreat, near Dublin, Nov. 30, 1828.

ISABELLA GRAPE.—Much paper and ink have been wasted about the origin and value of the Isabella grape. I formerly understood, that Col. Hawkins obtained it from the garden of Mount Vernon, as a grape Fountainbleau; but, recently, the gentleman who succeeded Mr Hawkins as agent to the Creek Indians, informed me that the scions were received from Mr Fraser, a gentleman on botanical researches, who called it a French grape. Monsieur Roma had the same vine in his garden in Savannah, and said it was a French muscadet. It may be of much value to the north, where the climate suits it; but is worthless in the south, by reason of its ill habits. Half, or more, of the grapes, rot every year before the season what it may; and only three or four ripe berries can be obtained from a bunch at one time, and nearly a month is required to ripen all the berries on a branch; hence it is no wine grape in our climate. When ripe berries can be obtained in sufficient quantity, it yields wine of nice flavor, provided the grapes are not too ripe, and the vintage remain only four or five hours in the vat; but let the grapes become mellow on the vines, and then let the vintage remain twenty four hours in the vat, and the wine is ruined—dull, heavy, flat, and a strong taste of the seeds.*

ALEXANDER'S OR SCRUYLKILL GRAPE.—This

*These remarks, it will be observed, do not apply to the Isabella grapes, in our climate.—Ed. N. E. F.

grape is a native, and makes excellent wine under the following conditions: collect the grape so soon as the berries are of full color and in the plenitude of their juice; if they remain on the vines to become mellowed, the product will be a dead, flat and ill flavored wine. When the grapes are mashed, or crushed in the vat, let them remain only one hour and a half, when the *must* will have obtained a sufficiency of color; press, and the product will be a crimson rose color, with flavor of the first class; but let the vintage remain ten or more hours in the vat, the longer the worse, and the wine will be austere and taste strongly of the seeds. The juice of this grape may be called weak, sp. gr. 1.056—raise the *must* with brown sugar to sp. gr. 1.124, and the wine will be strong enough.

CATAWBA.—This wine is said to be a native, and yields a superior dessert wine; and as Mr Adlum justly remarked, its vinous product suits all palates. Whether the flavor of this wine may be injured by the grapes mellowing on the vine is not known to me; but that it may be materially injured by too long residence in the vat, before pressing, is very certain. Five or six hours in dry warm weather is long enough. In cool, or wet weather, the continuance of the vintage in the vat may be of longer duration.

BLAND GRAPE.—This is said to be of doubtful nativity. It makes good wine if we will have patience to wait for its maturity three or four years; it has a superabundant proportion of gum in the juice, part of which seems to be insoluble, and the lees formed by the vernal and autumnal fermentations do not subside and the wine become clear, without new additions of fining. No other wine that I have made requires refining. The vine and fruit are subject to mildew and rust.

WARREN VINE.—This vine seems to be of foreign origin, and is of the superior class of wine grapes. It is subject to rot considerably with me; its vinous product was adjudged by a *gourmet* to resemble the delicious wine of Cyprus.

ROUND VIOLET MADEIRA GRAPE.—This vine came from Madeira to Savannah, many years ago. The vine is not distinguishable from the Warren, but the fruit is of a lighter color, and the vinous product of a different flavor, and it is not subject to rot. It is a superior wine grape. The *gourmet* was probably correct about the flavor of the Warren vine, because all the wine grapes planted in Madeira, were transplanted from the island of Cyprus, in 1420, by Prince Henry of Portugal, Duke of Visco, together with the sugar canes of Sicily, for the use of the colonists.

Yours, respectfully,

J. S. SKINNER, Esq. THOMAS McCALL.

Wholesome Advice, from Johnson's Letters.—Begin life with the least show and the least expense possible; you may at pleasure increase both, but you cannot easily diminish them. Do not think your estate your own, while any man can call upon you for money and you cannot pay; therefore begin with timorous parsimony. Let it be your first care not to be in any man's debt. Resolve not to be poor; whatever you have, spend less. Poverty is a great enemy to human happiness, it certainly destroys liberty, and it makes some virtues impracticable, and others extremely difficult.

There are no less than 2,533 varieties of the Rose, of which 18 belong to the Moss Rose, 20 to the Dog Rose, and 1,215 to the Provence Rose.

From the New York Farmer.

ON USE OF GYPSUM IN AGRICULTURE.

SIR—The extensive application of Plaster of Paris in the interior of this state, to the purposes of husbandry, induces me to hazard a few remarks upon the causes of its fertility, and the soils and crops to which it may be advantageously applied. I perceive that many of our farmers, although slow to adopt this or any other innovation upon old habits, now that they have become satisfied of the benefit of plaster in some cases, seem to infer that it is useful in *all*, and thus apply it without "rhyme or reason." The consequence, I fear, will be to bring it into disrepute and lead to its rejection in cases where its utility is unquestionable.

The most common opinion is, that this substance benefits crops by drawing moisture from the atmosphere. This theory proves too much: for if it has so strong an affinity for moisture, it will attract it from the soil as well as from the atmosphere; and thus rob the plant, instead of increasing their supply, of this essential agent of vegetable development. But it has been proved that gypsum absorbs moisture far less powerfully than putrescible manures, or even common soils, and retains it a shorter time. Johnson has given us, in his essay on the use of salt in agriculture, tables exhibiting the absorbent and retentive powers of different substances. I subjoin an extract in proof of my position:—

1000 parts.	Horse dung evaporated previously to dryness, at a temperature of 100°,	145
	absorbed, during an exposure of three hours to air saturated with moisture at 62°,	
	Putrified tan bark, under like circumstances, (66°,)	145
	Unputrified, do	115
	Cow dung do	180
	Pig do do	120
	Sheep do do	31
	Refuse Salt (63°)	49
	Burnt Clay,	29
	The richest soil (in one hour)	23
10 parts.	Lime, (part carbonate)	11
	Gypsum,	9
	Pig dung, evaporated to dryness, at a temperature of 106° (the heat of a meridian sun at midsummer) and then moistened with six parts of water, required for being reduced to dryness again, at the above temperature,	min. 135
	Horse dung, under similar circumstances,	90
	Common Salt,	75
	Rich Soil,	32
	Poor Soil (silicious),	25
	Gypsum,	18

Thus it appears, that the absorbent power of horse dung is sixteen times greater than that of gypsum, and its retaining power seven times greater. Let us not lose sight of another important fact which these experiments suggest, viz: That the power of a soil for absorbing and retaining moisture, and of course of resisting drought, is in the ratio of the dung and vegetable matter which it contains—rich soil suffering least, and poor soil most in dry weather.—Ploughing and hoeing frequently tend very much to increase, or rather to bring into full

operation, these qualities of soils for absorbing and retaining moisture.

After water has been expelled from plaster of paris by burning or heating, it then again absorbs it powerfully—and not only absorbs, but solidifies it. It is by this process that it is fitted for cornices, busts, &c.

Another agency which has been ascribed to plaster in the process of vegetation, is that of accelerating putrefaction in the soil—of rendering inert vegetable matter soluble, and thus increasing the supply of vegetable food. The experiments of Sir H. Davy disprove this theory, and show that gypsum rather retards than increases animal and vegetable putrefaction.

Some, supposing that plants are gifted with sensation, contend, that gypsum acts as a condiment to the vegetable, as spices do to the animal system, and benefits by stimulating their absorbent and assimilating organs. I am not physiologist enough to discuss this point, and will therefore barely observe, that if this is so, all plants are not equally sensitive; for many are certainly not affected by this stimulus.

Others again have maintained, that plaster owes its utility to the sulphuric acid (oil of vitriol) which it contains; and of course that a decomposition or separation of parts, takes place in the soil. Sulphuric acid has been applied, blended with different parts of water, without seeming to confirm this theory. But a sufficient objection is found in the fact, that gypsum is detected in the clovers and other plants, showing that no decomposition has taken place, and that the sulphuric acid, remaining chemically combined with its base, could not have acted separately.

Sir H. Davy, I think, has suggested the true cause of the fertility in gypsum: That it forms as necessary a constituent of some plants, as a few drops of peppermint do to a mint sling; and that when the soil does not contain it, in the small proportion needed, its application is necessary for their complete development and perfection—and that it is only useful to such crops as yield it on analysis, and on soils where it is deficient. Of the plants which contain gypsum, Sir H. Davy has enumerated the clovers, luzern, sainfoin and some other grasses; in which he believes it may exist to the amount of three or four bushels on an acre of these plants. The turnip crop yields it in small quantities; and if this theory is correct, Indian corn and potatoes will afford it, as it evidently benefits these crops. He adds, that *gypsum is not taken up in corn crops*, such as wheat, rye, barley, &c. A course of experiments during ten years, has satisfied me that these crops are *not* benefited, directly, by its application, but often indirectly, by increasing the growth of other vegetables, which ultimately enrich the soil.

The soils which plaster most benefits, are the poor lean sands and sand loams; and its effects diminish in proportion as these become more rich, adhesive, or wet. The dung of cattle contains gypsum; so does peat or bog earth. To lands often dunged, its effects are consequently less perceptible. That it does not prove efficacious upon wet lands may be accounted for by their generally abounding in bog soil, and not usually producing plants which contain gypsum.

As to the time and manner of applying plaster, different opinions prevail. It cannot enter the

mouths of plants until it is dissolved, or become soluble. To effect this, 500 times its weight of water is found to be requisite. This would seem to indicate that it should be sown early on grass lands. My practice has been to sow in March, or early in April, and if practicable, upon a light snow. When sown late, and a dry summer ensues, its benefits are frequently not perceptible, probably from the circumstance of its not having been dissolved. I have followed the example of two great pioneers in the improvement of American husbandry, the late Judge Peters and John Taylor, in sowing it for Indian corn and potatoes before the last ploughing. I consider the benefit in this method more certain and the labor less, than in that of strewing it on the hills of the growing crop.

The experience of practical men seems to have fixed the proper quantity at from one to two bushels the acre.

Plaster appears partially to have lost its efficacy in some parts of Pennsylvania, where it has been longest and most successfully used. It is said, to adopt the common language, that the soil has become tired of it. I suspect too much reliance has been placed upon it; and that it has been used as a substitute rather than as an auxiliary, for old fashioned barnyard dung. There is another way of accounting for its apparent failure. Has not the soil become tired of the plants which it aids, and which may have exhausted it of some other constituent? In the Norfolk system of alternate husbandry, it was long ago ascertained that clover could not be sown to advantage oftener than every second course, or once in eight or ten years, and other grasses were consequently alternated with it. The practice in Pennsylvania has been, I believe, to continue sowing clover every four or five years.

The preceding view of the subject and my personal experience, induce me to offer the following rules for the consideration of the farmer:

1. That plaster may be applied to pasture and meadow lands, not absolutely wet, with strong probability of profit—as it undoubtedly forms a constituent of many of the grasses, increases their vigor, and thickens the soil.

2. That it may be applied, with equal prospect of success, to the maize and potato crops, and I think, to legumes, such as peas, beans, &c. These being sown, as good husbandry implies, upon lands naturally free from surface water, or rendered so by draining.

3. That its benefits are greatest upon sands, gravels, and light loams; and that these benefits diminish in proportion as the soil becomes rich, either naturally or by the application of dung.

4. That plaster can never become a substitute for dung, but may be rendered a valuable auxiliary—benefiting some crops directly, and all remotely, by increasing the volume of vegetable matter, which ultimately becomes the food of plants.

5. That from one to two bushels per acre is a sufficient annual dressing for lands.

6. That upon grass it is most profitably sown early, that the vernal rains may render it soluble; and upon tilled crops before the last ploughing, that the moisture in the soil may perform this office in season, in both cases, to benefit the summer's growth.

And, finally, That its use can be best regulated by the farmer himself carefully noting its

effects upon different crops, soils, &c. always leaving a strip unplastered upon crops which it is supposed to benefit, and plastering a strip upon those on which its benefits are doubtful.

Very respectfully,
J. BUEL.
Albany Nursery, Nov. 24.

ON THE CULTURE OF THE VINE.

In February, take a single joint of the vine you choose; cut it off a half an inch above the eye, and again at two inches below the eye; cover each end with sticking plaster of any kind, and set it in a pot of garden mould, above five or six inches in diameter, and unglazed. The eye of the cutting must be covered with earth, and then watered to settle the ground: after this lay half an inch of horse manure on the surface to keep it from becoming dry and hard, and place the pot in a hot bed prepared for raising cabbage plants. If more than one shoot rises from the eye, rub off all but the strongest. About the first of June, turn out the vine from the pot, and set it in the garden, or at the east or north end of your house; wherever it can be protected from violence. It will grow in any soil, but like other plants it grows best in the best soil. When first removed, water it at a distance from the plant, so as to draw the earth toward the vine, instead of washing the ground from it. If you water it afterwards, pour your water into a trench at least eighteen inches from the plant; for unless this precaution be used, watering does more harm than good, and does most injury in the driest time. As the vine shoots, it must be prevented from falling. In November, a slight covering of straw is beneficial to prevent freezing and thawing of the vine. In February it must be trimmed by cutting it off at a half an inch above the eye; all the eyes below are to be carefully rubbed off, as being imperfect:—The eye thus left will sometimes produce more than one shoot, in which case all but the strongest should be rubbed off. In November, this shoot is again to be covered, and in the following February is to be again cut off above the second lowest clasper: that is leaving on two eyes to shoot this season, and again rubbing off all the eyes below the lowest clasper. Both these shoots should be permitted to grow their utmost length; which if the soil be favorable will be very considerable, and there will be reason to hope for fruit in the next season. In the third February cutting, three eyes upon each shoot may be left, and no more. From this time forward all the side branches from the shoots of the year are to be rubbed off, taking care not to injure the leaf whence they spring, which is the nurse of the bud at the root of its stem.

At the fourth time of cutting the vine, and from that time forward, it may be cut about the last of October; four eyes may then be left, and the fifth cutting, five eyes may be left on each shoot and never more, even in the most vigorous state of growth, for the injuries thereby done to the vine will be seen and lamented in succeeding years.

Anger destroys Reason.—When a man is angry he will answer no good purpose to attempt to argue a point with him, or to try to convince him that he is wrong, either in practice or in principle. You must wait till the paroxysm of passion has subsided, and the impatient sufferer becomes again a rational being.

From the New York Statesman.

NATURAL SCIENCES.

Every day affords us evidence of increasing intercourse between the naturalists of Europe and this country. This is as it should be, for, to say nothing of its obvious tendency to soften the asperities, and diminish the coldness which frequently occur between the learned of different countries, this mutual communication of friendly offices and early notice of each others labors, is of great importance to the whole learned world.

A pleasing instance of attention from one of the most distinguished Geologists of Europe to the Lyceum of Natural History of the city, has lately come under our notice. The Rev. Dr Buckland, of the University of Oxford, England, has presented to this society a set of casts of the teeth and bones of two species of Mastodon, found in diluvium not long ago, in the kingdom of Ava. It may not be known to the generality of our readers, that naturalists were already acquainted with six species of this gigantic genus of animals, of which none are now found alive. Of these, one was peculiar to North America, two to Europe, two to South America, and one common to Europe and South America. The recent discovery of similar remains in Asia has excited much interest among naturalists. It is now ascertained that these Ava Bones, although resembling those of Mastodon in size and structure, yet differ from all those known, and have accordingly been designated as two distinct species, and increasing the number now known to eight.

The casts referred to are such exact and admirable copies of the original remains, and the colors are imitated in so perfect a manner, that they exhibit altogether a proficiency in the plastic art, which our artists would do well to study.

The discovery of these remains must have been highly gratifying to that distinguished naturalist, Dr Buckland. In his celebrated work, "Reliquiæ Diluvianæ," in giving an account of the remains of the Elephant, the Rhinoceros, &c., &c., found in the European deposits of Diluvium, made by the last great deluge that has swept the face of the earth, he anticipated a repetition of the same circumstances in distant deposits of Diluvium to be hereafter discovered—an anticipation which has been realized, by the discovery of these Bones in the Kingdom of Ava, accompanied by those of the Elephant, the Rhinoceros, the Hippopotamus and various antediluvian animals. Our own country is covered in every direction with diluvium of the same period, and from the examination of which many new and interesting discoveries may be also anticipated.

Kitchen Economy.—A friend has mentioned to us an improvement in kitchen economy which we think deserving of notice. It may be called an *iron back log*, and is cast hollow, to contain water. A small leaden leader is attached to this iron cylinder, which is placed at the bottom of a wood fire, and connected with a cask or tub of water near the fire place, or in any convenient part of the room. The family may thus have a constant supply of hot water, without incumbering the fire-place, and with much less than the ordinary consumption of fuel for that purpose.—*Long Island Star.*

GOLD WASHINGS.

Strange as it may appear, it is a fact, that till very lately the jewellers were in the constant practice of throwing away the water into which they dip articles of jewelry after they are taken out of the boil (a menstrum of nitro muriatic acid, employed to give them a high finish,) without being at all aware of the quantity of gold that was thrown away with it. Of late a person possessed of some chemical knowledge is said to have made a handsome livelihood, by instructing jewellers, at the rate of five guineas each, in a method of recovering gold contained in the washing. This method consists simply in adding a solution of copperas, which precipitates the gold, and then fusing the residuum with nitre, by which the iron in combination is oxidated, and the gold left in a pure state.—*Mechanic's Magazine.*

In boring for water on the island, at the upper end of this village, owned by Mr Sewell, a vein of water was struck at the depth of 160 feet, which emits an inflammable gas in large quantities. It is so perfectly free from the nauseous smell of the oil gas, that its existence was discovered only by the casual introduction of a light into the mouth of the well.—*Watertown Register.*

Damask Table Linen.—Mr Hamilton Stewart, of Pittsburgh, has commenced the manufacture of Damask Table Linen. The Statesman of that city observes, that "the Table Cloths are extremely neat, and what is of equal importance, they are very cheap, and of a texture that will insure service and durability. In weaving the cloth, the threads are so arranged and managed, that almost any figure, name, or letters can be made to appear in full view upon the surface."

Method of curing Pork Hams, to make them far superior to those cured in the common way.—To twelve common size hams, such as are cut from hogs weighing from 140 to 200 pounds, take 12 lbs. fine salt, 8 oz. of salt petre, and 3 pints of molasses—mix them well together—rub the hams with it, and pack them down in a tub or cask, and let them lay one week—then put to them pickle enough to cover them, made as follows:—To 3 gallons of water, put fine salt enough to make it bear an egg—add 1 quart of molasses, 2 quarts of strong ashes lie, (made from ashes without lime) and a porter bottle of purified pyroligneous acid—let them lay in it four weeks—then take them out and hang them up in a dry room—when dry they are fit for use.

Hams cured in this way are clean, tender, juicy, and fine flavored, without the waste occasioned by the drying and filth of smoking in the chimney or smokehouse.—*Newport Republican.*

Cleared from the port of Meadville, (Pa.) the fast sailing boat "THE ANN ELIZA."

All the materials of which this boat was built were growing on the banks of French Creek, on the 27th ult. On the 28th she was launched, and piloted to this place before sunset, by her expert builders, Messrs. Mattocks and Towne. Her cargo consisted, amongst other things, of 3000 reams of crown, medium, and royal patent *straw paper*, with patent book and paste boards; and left this place early on the 30th ult. for Pittsburgh, with about 20 passengers on board.—*Crawford Mess.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY JAN. 2, 1829.

BROAD WHEELS.

To preserve a road by improving the wheel carriages which pass over it, all agree that the wheels should be made broader than they usually are, and cylindrical: that carts with two horses abreast are less injurious than such as are drawn by two horses in a line: and that it would be an advantage to have the axletrees of different lengths.

Edgeworth, upon a careful examination, concludes, that the system of rolling roads by very broad wheels must be abandoned; and that such a breadth only should be insisted upon, and such restrictions made as to loading, as will prevent the materials of the road from being ground to powder, or from being cut into ruts. With this view the wheels of carriages of burden should have felloes six inches broad, and no more than one ton should be carried on each wheel.

Farcy is of opinion, that six inch cylindrical wheels, or under, are the most practicable and useful, provided the projecting nails are most rigidly prohibited, which can never be done but by a penalty per nail upon the wheelers who put in those nails, and upon the drivers of the carriages, who use such roughly nailed wheels.

Telford thinks that no wagon or cart wheel ought to be of less breadth than four inches, and that in general no carriage ought to be allowed to carry more than at the rate of one ton per wheel: "when it exceeds that weight," he says, "the best materials which can be procured for road-making must be deranged and ground to pieces."

Paterson is a warm advocate for broad wheels. "If the wheels were used double the breadth as at present," he says, "they would act as rollers upon the materials, binding them together, and consequently the surface would always remain smooth and free from ruts; and the waste or decay, would, of course, be exceedingly little." All broad wheels, however, should be made on a construction different from those that are in common use. Those in common use, whether broad or narrow, are generally *dished* (as it is called) on the outside, and the ends of the axletree bent a little downwards. This causes the wheels to run wider above than below; and the reason, I believe, for adopting this plan, was to allow people to increase the breadth of their carriages, and get the wheels to run in the same track. Upon this plan, the edges of the wheel, to run flat on the road, must be of a *conical* shape, the outer edge being of less diameter than the inner one. Any bad effect arising from this is indeed very little felt from the narrow wheels; but as they increase in breadth, the evil increases in the same proportion. "A conical wheel," says Edgeworth, "if moved forward by the axletree, must partly roll and partly slide on the ground, for the smaller circumference could not advance in one revolution as far as the larger." Suppose," says he, "the larger revolution sixteen feet, and the smaller thirteen feet, the outer part must slide three feet, while the carriage advances sixteen, i.e. it must slide nearly one fifth of the space through which the carriage advances,—thus, if loaded with ten tons, the horses would have two tons to drag, as if that part of the weight was placed on a sledge." The same thing has been ably and beautifully demonstrated by Cumming, (*Essay on the Principles of Wheels and Wheel Carriages, &c.*) and is very easily illustrated; take

for instance, the *frustum* of a cone, or a sugar loaf, from which you have broken off a little bit at the point; then set this a rolling upon a table, and instead of going straight forward it will describe a circle; and if you will put a pin or axletree right through the centre of it, and upon that axle cause it to move straight forwards, the smaller diameter must slide instead of rolling. It is evident, therefore, that the rims of the wheels ought to be of a *cylindrical* form. Edgeworth states in relation to this, that "from the testimony given to the committee of parliament, by every person of science and judgment, cylindrical wheels and straight axletrees have been unequivocally preferred."

Farcy finds the Whitechapel road more injured by broad wheels than any other, owing to those wheels being barrelled and conical, and not running flat, and the middle tier projecting above the others with rough nails.

Cumming has proved experimentally, before the committee of 1808, that when the rim of a wheel is made truly cylindrical, so as to have an equal bearing on its whole breadth, the resistance to its progress on a smooth road is not increased by increasing its breadth. And in regard to the immense saving that would accrue to the nation, Jessop, in his report, says, "I may venture to assert, that by the exclusive adoption of cylindrical broad wheels, and flat roads, there would be a saving of one horse in four, of seventyfive per cent in repairs of roads, fifty per cent in the wear of tire, and that the wheels with spokes alternately inclined, would be equally strong with conical ones, and wear twice as long as wheels do now on the present roads." But over and above the preference due to such wheels, in respect to public roads, they are no less preferable when applied to purposes of husbandry. Besides the great resistance to the draught occasioned by the sinking of the narrow wheels on soft land, every farmer knows what injury is frequently done to subsequent crops by such poaching and cutting up of the land. But this is not all. Many a field of beautiful pasture, when subjected to the destroying operation of the narrow wheels, is very much injured, both in respect to the appearance and the crop, which would be entirely prevented by using broad wheels. Thus it has been stated in regard to the introduction of the use of broad wheels, that the saving on the incidental repairs of the road would be immense; that the roads would uniformly retain a smooth and even surface, which would greatly contribute to the comfort of the traveller, and the ease of the draught; that in husbandry also the advantages would be great; in short, that in every point of view, the benefits that would be derived in consequence, would be paramount to everything that would be urged in favor of the narrow wheels.

McAdam thinks a wagon wheel of six inches in breadth, if standing fairly on the road with any weight whatever, would do very little material injury to a road well made and perfectly smooth.—The injury done to roads is by these immense weights striking against materials, and in the present mode of shaping the wheels, they drive the materials before them instead of passing over them. If a carriage passes fairly over a smooth surface, he says, that cannot hurt the road, but must rather be an advantage to it, on the principle of the roller. On being asked, "are you not of opinion that the immense weights carried by the broad wheeled wagons, even by their perpendicular pressure, do injury,

by crushing the materials?" he answered, "On a new made road, the crush would do mischief, but on a consolidated old road, the mere perpendicular pressure does not do any. But there is a great deal of injury done by the conical form of broad wheels, which operate like sledging, instead of turning fairly. There is a sixteen inch wheel wagon, which comes out of Bristol, that does more injury to our roads than all the travelling of the day besides."

With regard to regulating the weight to be carried on wheels, Farcy judiciously observes, that though it is not easy to state any one scale that would be generally applicable for each breadth of wheels below six inches, there should be a rate fixed, which should apply to ordinary or gate-tolls; and at the weighing machines additional, or what may be called machine tolls, should be levied upon all carriages which exceeded the weight, to be regulated in an increasing scale for each breadth of wheels, so as very greatly to discourage, but not ruinously to prohibit the occasionally carrying of large weights upon any wheels.

Axletrees of different lengths have been proposed by some engineers, with a view of preserving the roads. On this subject Paterson observes, "at present the axles of all kinds of carriages are made to one length, so that their wheels all run at the same width, and in the same track, than which nothing could be more fitly devised for the destruction of the roads. I would, therefore, propose that the length of the axletrees should be varied, that the wheels of the lighter description of carriages should run two inches narrower than the present track; and that the axles for the more weighty carriages should be increased in length, so that the wheel should run from one to four inches beyond the present track. I would also propose, that mails, and other heavy coaches, should be so constructed, that the hind wheels should follow either two inches within, or two inches outside the track of the fore wheels, as might be considered most proper. Were the axletrees of all kinds of carriages to be of various lengths as here proposed, we should have no rutted roads. The stones now displaced by the wheels of one carriage, would be replaced again by the next carriage that came up, having its axle of a different length; and in the same manner would the hind wheels repair the injury done by the fore wheels of a carriage. If this plan was to be acted on all over the kingdom, it is evident that it would have a very beneficial effect on the roads; and if it should be found thus to contribute to the keeping the roads smooth and even, it is also evident that it must contribute in the same proportion to the comfort of travellers of every description, and also to the ease of the beast of draught.

CULTURE OF THE GRAPE.

The following extract of a letter of a recent date, written by a gentleman who is well qualified to speak upon the subject, shows what may be done in this interesting pursuit, which is now occupying the public attention. The writer resides on the Georgia side of the Savannah river, a few miles above Augusta.

"Send me a quarter cask of Madeira Wine—I hope soon to make some of this article for sale. The vines I got from Adlum, of Georgetown, in 1825, will bear fruit this year; but a small por-

tion of them took root; I have, however, now got near 800 vines growing, and I am increasing the vineyard—in three years, from what already is planted, I expect to make at least 40 pipes, and increase yearly. I have for four years past made a little wine from 11 old vines in the garden, equal to most Madeira imported, none who have tasted it believed that such wine could be made in America."—*Charleston Courier*.

Culture of Silk.—Within a few days our attention has been called to this useful and highly interesting subject.—Mr Canfield, a respectable and intelligent farmer of the town of Clay, in this county, informs us that he intends as soon as practicable to engage in the profitable business of rearing the Silk worm—that he contemplates appropriating six or more acres of ground to the culture of the Mulberry tree.—*Syracuse Advertiser*.

Feeding and fattening Fowls.—Fowls will become fat on the common run of the farm-yard, where they thrive upon the offals of the stable, and other refuse, with perhaps some small regular daily foods; but at thrashing time they become particularly fat, and are thence styled barn-door fowls, probably the most delicate and highly flavored of all others, both from their full allowance of the first grain, and the constant health in which they are kept by living in a natural state, and having the full enjoyment of air and exercise. It is a common practice with some housewives to coop their barn-door fowls for a week or two, under the notion of improving them for the table, and increasing their fat; a practice which, however, seldom succeeds, since the fowls generally pine for the loss of their liberty, and slighting their food, lose instead of gaining additional flesh. Such a period, in fact, is too short for them to become accustomed to confinement.

Eggs become desiccated, and, in consequence, lose great part of their substance and nutritive quality, by keeping, and everybody knows the value of a fresh-laid egg. They will retain their moisture and goodness, however, three or four months or more, if the pores of the shell be closed and rendered impervious to the air by some unctuous application. We, generally, anoint them with mutton suet melted, and set them on end, wedged close together in bran, *stratum super stratum*, [layer above layer] the containing box being covered closely,—laid upon the side the yolk will adhere to the shell. They thus come into use at the end of a considerable period of time, in a state almost equal to new-laid eggs for consumption, but ought not to be trusted for incubation, excepting in the case of imported eggs of rare birds.

Ice a Medicine.—The custom of taking ice in Italy and Sicily is considered as an indispensable refreshment and as a powerful remedy in many diseases. The physicians of these countries do not give many medicines; but frequently prescribe a severe regimen, and prevent the baneful effects of various diseases, by suffering the sick, for several days, to take nothing but water cooled with ice, sweet oranges, and ice fruits.—*American Sentinel*.

Orchard Grass Seed.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, Boston,—a consignment of prime Orchard Grass Seed, raised by Mr LLOYD JONES, of Pennsylvania, who is well known as the most extensive and success-

ful cultivator of this valuable grass in this country, as the following letter shows:

"MR RUSSELL.—In regard to the character of Mr JONES' seed, I have pleasure in saying, that it is the best in this market, and always commands an extra price. Col POWELL, always purchases of him, not only for himself but for his southern friends; and the Pennsylvania Agricultural Society, at their last exhibition, awarded him the premiums for both Orchard Grass and Clover Seed.

Yours, &c., JOHN P. MILNOR.

Recording Secretary Penn. Agri. Society.

Gentlemen who wish to secure a supply of this seed, will do well to secure it soon.

Also, a most extensive supply of Garden, Field, and Flower Seeds, raised expressly for us, or procured from the most unquestionable sources.

Canary Birds.

For Sale, a few copies of the New and Complete Canary Bird Fancier, containing a variety of useful information, by which the admirers of those beautiful Birds may be instructed in their management while breeding, and their treatment when diseased; with useful Hints to the breeders of Mules. From the latest London Edition.—Price 25 cts. Just received at the

Agricultural Warehouse.

No. 52 North Market Street, Boston.

Valuable Real Estate, &c, For Sale.

The Subscriber offers for Sale, the following Real Estates in Durham, N. H. viz:

About 50 acres of land, under good cultivation, with tolerable buildings thereon;—Soil of excellent quality, and capable of a high degree of improvement. Also, a Farm on the New Hampshire Turnpike road, containing about 80 acres, with buildings nearly new.

Also, a Farm of about 110 acres, with new buildings, lying within two miles of the New Market Factories.

Also, a small Farm lying in the Great Bay containing 30 or 40 acres, a very productive and excellent tract of land, in the neighborhood of the above named Factories.

Also three Houses in the Village of Durham—one of them possessing excellent accommodations for a Tavern.

Also, a Farm in Lee, containing about 30 acres.

Also, a Wood Lot in Barrington, containing 105 acres, well wooded.

He also offers for sale, a Stud Horse of approved blood, and several Mares and Colts of different ages.—All kinds of Farming Utensils, and Stock of all sorts.

The above described Lands are within a short distance of the large Factory Establishments at Dover and New Market.

Durham, Dec. 26, 1823.

JOHN FROST.

Two Heifers For Sale.

Two Superior Heifers, with calf, mixed between the Denton and Coelebs breed. Both of which took a premium at the late Show in Brighton.—Inquire of Daniel Chandler, Lexington, or at the counting room of the New England Farmer, Agricultural Warehouse, Boston.

3t

Jan. 2, 1829.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranunculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Field Peas.

A consignment of 50 bushels of Field Peas, from Vermont, of the growth of 1827, in good order. They will be sold by the tierce at \$1.75 per bushel.

Oat Meal, &c.

Fine Oat meal and Oat Flour, Hulled Oats, Hulled Barley, Barley Flour, &c. for sale by the barrel or less quantity, direct from Stevens' Mills, Vermont.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts a paper. They were gathered by a gentleman familiarly acquainted with the sorts, expressly for us. They will be sold by the single paper, or packed to order, in any quantity.

Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are war-

ranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.

Orchard Grass Seed.

A few more bushels of this valuable Grass Seed, growth of 1828. Also, Lucerne, White Clover, Fowl Meadow, and every other kind of Grass cultivated in New England.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for us.—For sale by the lb. or ounce.

Shallots for fall planting, Tree and Potato Onions.

Tangier Cauliflower.

We have just received through Mr Malony, the American Consul at Tangier, a few lbs. of this celebrated Cauliflower seed. A small parcel was sent to the Hon. Jonathan Hunewell of this city, a few years since, who pronounces it altogether superior to any seed from England, and which produced cauliflowers much finer than any he had seen cultivated in this country.

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the *Rheum Undulatum*, or Tart Rhubarb, or Pie-Plant, an excellent article for summer use. (See N. E. Farmer, vol. vi. page 290, and page 11 of this volume, and Fessenden's New American Gardener, article *Rhubarb*, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts. per root

Seed Potatoes.

A few bushels La Plata or Long Red Potatoes, raised by Mr Georgas of Weston; selected for seed, of a uniform size, and much improved as to their earliness, by the careful attention of Mr G. For sale at the

New England Farmer Seed Store,

No. 52 North Market, Street—Boston.

MISCELLANIES.

NEW YEAR ADDRESS

To the Patrons of the New England Farmer.

AGAIN the incessant lapse of Time
Demands our Monument of Rhyme,
Like that which Horace bragg'd about,
And tall enough the skies to flout,
Compared with which the Tower of Babel
Would seem the lean-to of a stable.

We're highly gratified to find,
The public more and more inclined
The Cultivator's art to practise,
And patronize, because the fact is
That righteousness and cultivation
Go hand in hand t' exalt a nation:
And Husbandry's a hobby which
A world may ride with spur and switch,
(Though not like jades, which will not stir
Without the aid of switch and spur);—
If all mankind at once bestrode him
They could not tire nor overload him.
Not only men, who sit astride,
But Ladies also on a side-
Saddle so neat, or on a pillion,
That's big enough to hold a million,
May ride our hobby with a cheer-up,
And he'll not kick, bite, plunge, nor rear up,
But *vires in eundo crescit*,
As cousin Virgil somewhere has it.
So Fire, which has obtain'd ascendance,
When setting up for independence,
Prepares by heat of radiation
Combustibles for conflagration;—
By burning fast, the mighty master
Acquires fresh means of burning faster,
Till blazing pyramids arise,
Which threaten to consume the skies.

With ken prophetic, we behold
A brighter age than that of gold,
Which, with accelerating pace,
Is hurrying on to bless our race;
And hail its grand approximation,
Mark'd by superior cultivation,
When wise men's heads, and good men's hearts,
Devoted to the art of arts,
And industry's untiring hand,
Shall make a garden of our land—
Yea, make New England, all exceeding,
A new edition of old Eden,
If not quite equal, yet before it,
In many a root, and fruit, and floret,
Indebted for its propagation
To modern arts of cultivation.

We're tranced with rapture, when we find
The fairer moiety of mankind,
Whose smile makes mortal man's condition
But little short of sheer fruition,
By whose society is given
Earth's purest prototype of Heaven,
Th' angelic part of human nature
Inspire and aid the Cultivator.
A plant that's sunn'd by Ladies' eyes
Will like an exhalation rise,
We hope that Horticulture may
Be therefore blest with Beauty's ray,
Till Flora's germes gem every waste,
And every grove's a "Bower of Taste."

* Virgil, however, says "*acquiri*," which not rhyming readily, we use a substitute;

"For rhyme the rudder is of verses."

Adam, in Eden, we believe,
Had been a brute without his Eve;
An arid heath, a blasted common,
Blest with the smiles of lovely woman,
We should prefer to a l that's rare
In paradise, without the Fair.
We therefore pray that Friendship's hand
From every Lady in the land,
May be to us henceforth extended,
From this time till our time is ended;
And would solicit every Charmer
To please to patronize our Farmer,
And make those gentlemen, who claim
Her approbation, do the same;
And common justice must require her
To grant this boon to an admirer
Like us, so prone to chaunt her praises,
In verse which absolutely blazes.

His head is very like a stump
Whate'er its craniologic bump,
Who does not see that we the Tillers
Of Earth compose the nation's pillars,
And may be styled with strict propriety
The props of civilized society.
What would have been poor mortals' lot—
Yea, what were man, if we were not?
Nature's poor, simple, houseless child,
The weakest wild beast of the wild,
Must live on browse, his home must be
A cavern or a hollow tree;
Sometimes, in spite of fears and cares,
Be served up raw to wolves and bears,
Or maugre tooth, nail, fist, and truncheon,
Make hungry catamounts a luncheon.

Our art, moreover, claims ascendance
As german to our independence;
Both, commonly, are coexistent,
And each the other's best assistant.
We Farmers are a sort of stuff,
Tyrants will always find too tough
For them to work up into slaves,
The servile tools of lordly knaves.
Those men who till the stubborn soil,
Enlighten'd, and inured to toil,
Cannot be made to quail or cower
By traitor's art or tyrant's power,
They might as well attempt to chain
The west wind in a hurricane;—
Make rivers run up hill by fright'ning,
Or steal a march on kindled lightning—
The great sea-serpent, which we've read of,
Take by the tail and snap his head off—
The firmament on cloudy nights,
Illume with artificial lights,
By such an apparatus as
Is used for lighting streets with gas—
Or, having split the north pole till it's
Divided into baker's billets,
Make such a blaze as never shone,
And torrefy the frozen zone—
With clubs assail the polar Bear,
And drive the monster from his lair—
Attack the comets as they run
With loads of fuel for the sun,
And overset by oppugnation
Those shining colliers of creation—
The Milky Way McAdamize,
A railway raise to span the skies,
Then make, to save Apollo's team,
The Solar Chariot go by steam.—
These things shall tyrants do, and more

Than we have specified, before
Our Cultivators they subdue,
While grass is green, or sky is blue.

But this is spinning out sublimity,
As one would cotton yarn for dimity;
We'll therefore break our thread off here,
By wishing you a happy year,
And all good things, which can be given
To man from all indulgent Heaven.

Boston, Jan. 1, 1829.

High Life and Domestic Life.—The gayest votary of pleasure, who pursues the phantoms of genteel dissipation, is generally the duller of domestic companions. In choosing a partner for life, the selection should not be made merely from public appearances. The undisguised realities of private life, the indications of worth or unworthiness, which the family fireside exhibits, are the only traits of character, in which any confidence can be placed.

Age and Perseverance.—It is a fault too much practised by both sexes to indulge in listlessness, and a kind of hopeless languor, at the decline of life. Our energies and talents were given us to persevere to the end.

A Rule for Conversation.—We should be as careful not to offend unnecessarily, as not to mislead intentionally, those with whom we converse; and indeed to give unnecessary pain, by remarks in conversation, is not only a breach of manners, but of morals.

Evenness of Temper.—Madame Necker relates the following anecdote M. Abauret, a philosopher of Geneva. It is said of him that he had never been out of temper; some persons, by means of his female servant, were determined to put him to proof. The woman in question stated that she had been his servant for thirty years, and she protested that during that time she had never seen him in a passion. They promised her a sum of money if she would endeavor to make him angry. She consented, and knowing that he was particularly fond of having his bed well made, she on the day appointed neglected to make it. M. Abauret observed it, and the next morning made the observation to her; she answered that she had forgotten it; she said nothing more, but on the same evening she again neglected to make the bed; the same observation was made on the morrow by the philosopher, and she again made some excuse in a cooler manner than before. On the third day he said to her, "you have not yet made my bed; you have apparently come to some resolution on the subject, as you probably found it fatigued you. But after all it is of no great consequence, as I begin to accustom myself to it as it is." She threw herself at his feet, and avowed all to him.

AGRICULTURE.

AGRICULTURE.

Written for the *Conversation-Lexicon*, by the Editor of the *New England Farmer*.

(Concluded from page 185.)

AGRICULTURE OF THE UNITED STATES.

The territory of the United States is very extensive, and presents almost every variety of soil and climate, which the earth affords. The agriculture of this wide spread country embraces all the products of European cultivation, together with some, (such as sugar and indigo) which are rarely made objects of tillage in any part of Europe. To give a full description of the agriculture of these states would require a large volume. We shall confine ourselves to such sketches as we may deem of most practical importance to those who are or intend to become cultivators of North American soil.

The farms of the Eastern, Northern, and Middle States consist, generally, of from 50 to 200 acres, seldom rising to more than three, and generally falling short of two hundred acres. Every farm is enclosed and divided either by stone walls, or rail fences, made of timber, not many hedges having hitherto been cultivated. The building, first erected on a "new lot," or a tract of land not yet cleared from its native growth of timber is what is called a log-house. This is a hut or cabin, made of round straight logs, about a foot in diameter, lying on each other, and notched in at the corners. The intervals between the logs are filled with slips of wood, and the crevices, generally stopped with mortar, made of clay. The fire-place commonly consists of rough stones, so placed as to form a hearth, on which wood may be burnt. Sometimes these stones are made to assume the form of a chimney, and are carried up through the roof, and, sometimes, a hole in the roof is the only substitute for a chimney. The roof is made of rafters forming an acute angle at the summit of the erection, and is covered with shingles commonly split from pine trees, or with bark peeled from the hemlock, (*pinus canadensis*.)

When the occupant, or "first settler," of this "new land" finds himself in "comfortable circumstances," he builds what is styled a "frame-house," composed of timber, held together by tenons, mortices and pins, and boarded, shingled, and clap-boarded on the outside; and often painted white, sometimes red. Houses of this kind generally contain a dining room and kitchen, and three or four bed-rooms on the same floor. They are rarely destitute of good cellars, which the nature of the climate renders almost indispensable. The farm-buildings consist of a barn, proportioned to the size of the farm, with stables for horses and cows on each side, and a threshing floor in the middle; and the more wealthy farmers add a cellar under the barn, a part of which receives the manure from the stables, and another part serves as a store room for roots, &c. for feeding stock. What is called a corn-barn is likewise very common, which is built exclusively for storing the ears of Indian corn. The sleepers of this building are generally set up four or five feet from

the ground, on smooth stone posts or pillars, which rats, mice, or other vermin cannot ascend.

With regard to the best manner of clearing forest-land from its natural growth of timber, the following observations may be of use to a "first settler." In those parts of the country where wood is of but little value, the trees are felled in one of the summer months, the earlier in the season the better, as the stumps will be less apt to sprout, and the trees will have a longer time to dry.—The trees lie till the following spring, when the limbs, which do not lie very near the ground should be cut off that they may burn the better. Fire must be put to them in the driest part of the month of May; or if the whole of that month prove wet, it may be applied the beginning of June. Only the bodies of the trees will remain after burning, and some of them will be burnt into pieces. Those which require to be made shorter are cut in pieces nearly of a length, drawn together by oxen, piled in close heaps and burnt, reserving such trees, and logs as may be needed for fencing the lot. The heating of the soil so destroys the green roots, and the ashes made by the burning are so beneficial as manure to the land, that it will produce a good crop of wheat or Indian corn, without ploughing, hoeing, or manuring.

If new land be in such a situation that its natural growth, may turn to better account, whether for timber or fire wood, it will be an unpardonable waste to burn the wood on the ground. But if the trees be taken off, the land must be ploughed after clearing, or it will not produce a crop of any kind.

The following remarks on this subject are extracted from some observations by Samuel Preston, of Stockport, Pennsylvania, a very observing, experienced, and judicious cultivator; which were first published in the *New England Farmer*, an agricultural paper, printed at Boston, Massachusetts.

Previous to undertaking to clear land, Mr Preston advises:

"1st. Take a view of all large trees, and see which way they may be felled for the greatest number of small trees to be felled alongside or on them. After felling the large trees, only lop down their limbs; but all such as are felled near them should be cut in suitable lengths for two men to roll and pile about the large trees, by which means they may be nearly all burnt up, without cutting into lengths, or the expense of a strong team to draw them together.

"2d. Fell all the other trees parallel, and cut them into suitable lengths, that they may be readily rolled together, without a team, always cutting the largest trees first, that the smallest may be loose on the top to feed the fires.

"3d. On hill-sides fell the timber in a level direction; Then the logs will roll together; but if the trees are felled down hill, all the logs must be turned round before they can be rolled, and there will be stumps in the way.

"4th. By following these directions, two men may readily heap and burn most of the timber, without requiring any team; and perhaps the brands and the remains of the log-heaps may all

be wanted to burn up the old fallen trees. After proceeding as directed, the ground will be clear for a team and sled to draw the remains of the heaps where they may be wanted round the old logs. Never attempt to either chop or draw a large log until the size and weight are reduced by fire.

"The more fire heaps there are made on the clearing, the better, particularly about the old logs, where there is rotten wood.

"The best time of the year to fell the timber, in a great measure depends on the season's being wet or dry. Most people prefer having the timber felled in the month of June, when the leaves are of full size. Then by spreading the leaves and brush over the ground, (for they should not be heaped) if there should be a very dry time the next May, fire may be turned through it, and will burn the leaves, limbs, and top of the ground so that a very good crop of Indian corn and pumpkins may be raised among the logs by hoeing; after these crops come off the land may be cleared and sowed late with rye and timothy grass, or with oats and timothy in the spring. If what they call a good burn cannot be had in May, keep the fire out, until it can be had in some very dry time in July or August; then clear it off and sow either wheat, or rye and timothy, harrowing several times, both before and after sowing; for after the fire has been over the ground, the sod of timothy should be introduced as soon as the other crops will admit, to prevent briars, elders, fire cherries, &c. from springing up from such seeds as were not consumed by the fire.

"The timothy should stand some four or five years, either for mowing or pasture, until the small roots [of the forest trees] are rotten; then it may be ploughed, and the best mode which I have observed is to plough it very shallow in the fall; in the spring cross-plough it deeper, harrow it well and it will produce a first rate crop of Indian corn and potatoes, and the next season produce the largest and best crop of flax that I have ever seen, and be in order to cultivate with any kinds of grain, or to lay down again with grass.

"These directions are to be understood as applying to what are generally called *Beech-lands*—and the chopping may be done any time in the winter, when the snow is not too deep to cut low stumps, as the leaves are then on the ground.—By leaving the brush spread abroad, I have known such winter choppings to burn as well in a dry time in August, as that which had been cut the summer before."

The agricultural implements, and farming operations of the United States, are, in most particulars, very similar to those of Great Britain. Circumstances, however, require variations, which the sagacity of the American cultivator will lead him to adopt, often in contradiction to the opinions of those who understand the science better than the practice of husbandry. In Europe land is dear and labor cheap, but in the United States the reverse is the case. The European cultivator is led by a regard to his own interest to endeavor to make the most of his land; the American cultivator has the same inducement to make the most of his labor. Perhaps, however,

this principle, in this country, is, generally carried to an unprofitable extreme, and our farmers would derive more benefit from their land if they were to limit their operation to such parcels of their possessions as they can afford to till thoroughly and to manure abundantly. A man may possess a large landed estate without being called on by good husbandry to back and scratch over the whole as evidence of his title. He may cultivate well those parts which are naturally most fertile, and suffer the rest to remain woodland, or, having cleared a part, lay it down to permanent pasture; which will yield him an annual profit, without requiring much labor.

The climate and soil of the United States are adapted to the cultivation of Indian corn, a very valuable vegetable, which, it is believed, cannot be raised to advantage in Great Britain.* This entirely, and very advantageously, supersedes the field culture of the horse-bean (*vicia faba*) one of the most common fallow crops in that island.—The *Root-husbandry*, or the raising of roots for the purpose of feeding cattle, is likewise of less importance in the United States than in Great Britain. The winters are so severe in the northern section of the Union, that turnips can rarely be fed on the ground, and all sorts of roots are with more difficulty preserved and dealt out to stock in this country than in those which possess a milder climate. Besides, hay is more easily made from grass in the United States than in Great Britain, owing to the season for hay-making being generally more dry, and the sun more powerful in the former than in the latter country. There are many other circumstances which favor the American farmer, and render his situation more eligible than that of those who pursue the same occupation in any part of Europe. He is, generally, the owner as well as the occupier of the soil which he cultivates; is not burdened with tythes; his taxes are light, and the product of his labors will command more of the necessaries, comforts, and innocent luxuries of life, than similar efforts would procure in any other part of the globe.

The American public seem, at present, fully aware of the importance of emulous and scientific agriculture, to the strength and prosperity of a nation. The state of Massachusetts has appropriated considerable sums to add to the funds of Agricultural Societies in that Commonwealth. Institutions for the promotion of husbandry, Cattle Shows, and Exhibitions of Manufactures, are not only common in that State, but in every part of the Union. A periodical publication entitled the *American Farmer*, is established at Baltimore, and another called the *New England Farmer*, is published in Boston. Men of talents, wealth and enterprise have benefited their country and acquired the highest honor to themselves by their labors and their liberality to improve American husbandry. Merino sheep have been imported by Gen. Humphreys, Chancellor Livingston, and others, and are now common in the United States.—The most celebrated breeds of British cattle have been imported by Col. Powel, of Powelton, near Philadelphia; and there prevails a general disposition with men of intellect, influence, wealth, and high standing in community to promote the prosperity of American Agriculture, by all the means, which these advantages enable them to call into action.

* Mr Cobbet is, however, attempting to cultivate Indian corn in England, but with what success we have not learned.

We shall conclude this article with a few brief notices of some of the most prominent benefits and improvements, which modern science has contributed to the art of agriculture. The husbandmen of antiquity as well as those of the middle, or what are called the dark ages, were destitute of many advantages enjoyed by those who now pursue the same occupation. Neither the practical nor the theoretical cultivators of those periods had any correct knowledge of geology, mineralogy, chemistry, botany, vegetable physiology, or natural philosophy; but these sciences have given the modern husbandman the command of some important agents, elements and principles of which the ancients had not the most distant idea. The knowledge of their writers was limited to methods of culture, which were sanctioned by experience; but the rationale of the practices they prescribed they could not, and rarely attempted to explain. Nature's most simple modes of operation were to them inexplicable mysteries, and their ignorance of causes often led to erroneous calculations, with regard to such effects as the cultivator is most sedulous to accomplish.

We are indebted to modern science for the following among other improvements, viz:

1st. A correct knowledge of the nature and properties of manures, mineral, animal, and vegetable; the best modes of applying them, and the particular crops for which particular sorts of manures are most applicable.

2d. The method of using all manures of animal and vegetable origin while fresh, before the sun, air, and rain, or other moisture has robbed them of their most valuable properties. It was formerly the practice to place barn yard manure in layers or masses for the purpose of rotting, and turn it over frequently with the plough or spade, till the whole had become a mere *caput mortuum*, destitute of almost all its original fertilizing substances, and deteriorated in quality almost as much as it was reduced in quantity.

3d. The knowledge and means of chemically analyzing soils, by which we can ascertain their constituent parts, and thus learn what substances are wanting to increase their fertility.

4th. The introduction of the Root-Husbandry, or the raising of potatoes, turnips, mangel-wurtzel, &c. extensively by field husbandry, for feeding cattle, by which a given quantity of land may be made to produce much more nutritive matter than if it were occupied by grain or grass crops; and the health as well as the thriving of the animals in the winter season greatly promoted.

5th. Laying down lands to grass either for pasture or mowing with a greater variety of grasses, and with kinds adapted to a greater variety of soils: such as orchard grass, (*ductylis glomerata*) for dry land; foul meadow grass, (*agrostis stricta*) for very wet land; herd's grass, or timothy, (*phleum pratense*) for stiff clayey soils, &c. &c.

6th. The substitution of fallow crops, (or such crops as require cultivation and stirring the ground, while the plants are growing) in the place of naked fallows, in which the land is allowed to remain without yielding any profitable product in order to have it recruit, or renew its fertility. Fields may be so foul with weeds as to require a fallow, but not what is too often understood by that term in this country. "In England, when a farmer is compelled to fallow a field, he lets the weeds grow into blossom, and then turns them down: in America a fallow means a field where the produce

is a crop of weeds running to seed, instead of a crop of grain."

7th. The art of breeding the best animals and the best vegetables, by a judicious selection of individuals to propagate from.

These improvements, with others too numerous to be here specified, have rendered the agriculture of the present period almost as different from that of the ancients, as the art of printing is variant from the Egyptian mode of conveying ideas by hieroglyphics.

FOR THE NEW ENGLAND FARMER.

HORN AIL IN CATTLE.

MR FESSENDEN—In the month of April last, I had a cow taken with the horn ail, to that degree that she had nearly stopped eating, and from giving a large quantity of milk, had become nearly dry. I punctured her horn with a gimblet and injected vinegar, in which salt had been dissolved. It was soon evident that it was an injury. I then applied to an aged acquaintance, who has had much experience in doctoring animals, and stated to him the case and what I had done. He said "it was very wrong ever to make a hole in an animal's horn for that disorder, that a very simple medicine would cure it."

"Take of salt, one-half pint, of stone soot,* one-half pint, of black pepper, one table spoonful, make all fine, and give one, or two, spoonfuls at a time, night and morning. It is easily done by drawing the tongue out of the mouth with the hand, and putting the spoon as far down as it will reach, then let go the tongue and keep up the nose and it will all go down." I followed the directions, and in two days my cow was better; and in a week was perfectly well. The same may not cure in all cases of horn ail, as my informant said it would, but it is worth the trial.

LOVETT PETERS.

Westborough, Dec. 10, 1829.

FOR THE NEW ENGLAND FARMER.

INSECTS ON FRUIT TREES.

[Extract of a Letter from a cultivator in New Hampshire, to the proprietor of the New England Farmer.]

DEAR SIR—I have read with some interest the late communications in your paper, respecting insects on fruit trees. About two weeks ago, I collected specimens of several kinds in order to send them to Mr FESSENDEN, and also wrote a short communication for the *Farmer*. In this collection were pieces of bark from the apple tree, covered with rye shaped shells, such as those mentioned by Mr Perley. Also pieces of bark from one of the pear trees, which I received from Mr Prince's nursery, last spring, covered with *white scales*, enveloping the insect described by your correspondent "M."

The first that I discovered of the insect last mentioned, was, I think, in September. The tree was then covered from the ground to the ends of the limbs, with a white appearance. Upon close examination they appeared like seeds of fishes, adhering closely to the bark of the tree, and upon pressure of any hard substance upon them, they exuded a dark reddish substance, as described by "M." On removing the scales, the bark under

* By stone soot, we suppose is meant soot obtained from a stone chimney in which wood is burnt. Probably wood soot obtained from a brick chimney, would answer a similar purpose.—EDITOR.

them was deeply stained even quite to the wood. Soon after they were observed they were scrubbed off with strong soap suds, and a woollen cloth. The bark has remained ever since curiously mottled with green and brown—brown spots wherever the scales were, and green where there were no insects. They were dissimilar to Mr Perley's insect, and, I think, have no connexion with the coffee shaped, bristly insect, mentioned by "M." I think I saw some of the last named insect upon the leaves of a small apple tree, and upon a Spanish filbert last summer. They fed ravenously upon the leaves, eating them edgewise. I did not pay much attention to them at the time, but cut the branches off, and crushed them under foot. I have, within a day or two, closely examined the trees upon which I saw them, but can find no appearance of scales."

Remarks by the Editor.—The above is from the pen of a respectable, judicious, practical cultivator, who has prohibited our publishing his name, attached to the communication. We regret this, for a good name adds value to a good article; and seems somewhat like giving a sanction to good precepts by good examples.

With regard to the insects in question we coincide in opinion with our correspondent, that they are not the same with Mr Perley's insect, or what we have often heard called the Bark Louse. We are likewise confirmed in the opinion, which we have before expressed, that the insect exuding a reddish substance, and the "coffee shaped, bristly insect" are not the same. Till the kinds of insects are discovered, and the specific remedies pointed out, we may as well use such means for destroying them as are most efficient for the destruction of all sorts of animalcule. They should be treated with lime water, tobacco water, solutions of potash, soft soap, quick lime in powder, ashes, tar water, spirit of turpentine, picked or scraped off by hand, &c. &c. These added to such judicious culture as may cause the plants to vegetate with vigor, will, generally, answer the wishes of the cultivator.

From the American Farmer.

FRUIT TREES AND VINES.

DEAR SIR, Kishacoquillis, Dec. 11th, 1828.

It is considered by most men, upon settling themselves permanently, an object of some importance to have good fruit on their farms and gardens, as soon as possible, and it has been common for those who are unable to come at nurseries of engrafted fruit for transplanting, to wait the bearing of seedling trees, or at least until they can have seedling stocks to engraft upon, and in either case it requires a period of ten or twelve years to elapse before a tree of this kind arrives at sufficient size to bear much fruit.

It is a fact which is not perhaps generally known, that the common white thorn, the crab apple, and the service or May cherry, make very good stocks for apples or pears, and may be found in great abundance in every part of our country.

By transplanting stock of the above kind in the fall, and engrafting them in the succeeding spring, we may have a handsome crop of fruit in four or five years, anticipating the usual period at least six or seven seasons.

For the different varieties of plums and cherries, roots of the common wild plum and field

cherry may be taken up at the proper season, engrafted, and immediately planted where they are to remain.

About an inch of the stock is left with the root, to insert the graft in, and the earth must be drawn up so as to protect it from the sun and air.

Since a method has been discovered for preventing the ravages of the worm in our peach trees, that delicious fruit, which at one time had nearly been extirpated, is again likely to become abundant.

I have pursued the following plan for eight or nine years, with complete success, by which I have been enabled to preserve upwards of 100 trees in good health and vigor, whilst most of the trees in my neighborhood were either dying or dead.

In the first place, if there is any gum about the roots, the earth is to be removed, and boiling water applied, as recommended by a young lady of New York. I can vouch for its safety and efficacy, having been in the practice of using it, and recommending it to others for the last eight years.

In the next place, a small barrowful of slaked lime or ashes is to be well rammed round the tree. This will generally secure them, so long as it is kept close and compact around the stock. But if, as it occasionally happens, gum makes its appearance at the surface, we know that a worm is below, engaged in the work of death; but by a little practice he may be instantly found and dislodged. For this purpose remove the earth, or ashes, with a common trowel, and by sounding the bark with a fine pointed knife, the cavity beneath will be found in which the worm is lodged, slit it open, and he will be found nestling at the bottom.

It is a prevalent opinion that the grape vines of France and Spain require some protection from our winter frosts, which is certainly a mistake, with respect to this, or I believe any part of the middle states. I have a considerable variety of the most tender foreign kinds, which I find to bear the exposure throughout our severest winters without injury. All that is necessary is to cut them loose in the fall from their fastenings, and suffer them to swing freely in the wind. It has been found by experience, that the foreign grapes, when transplanted into our climate, do not make wines of the same quality as in their native soil, and that if we ever produce a wine which will compete with those imported, it will be from a native vine; and to this end, it is desirable that experiments should be multiplied in every part of our country.

I have selected as the subjects of my experiments, the Schuylkill Muscadell, and a very fine grape which was discovered upon the hills in Armstrong county, of which I have 500 fine plants of two years old last spring.

The greatest obstacle to the successful cultivation of the vine I have yet experienced, arises from the depredations of an insect commonly known by the name of rose bug, which preys upon the leaves and blossoms, and have destroyed nearly all my grapes for the last two seasons, notwithstanding every pains I took to prevent it. If some of your subscribers will point out a remedy, it will much oblige his and your friend,

KISHACOQUILLIS.

A bill for improving and encouraging the breed of sheep, has passed the lower branch of the New Hampshire Legislature.

ADVANTAGES OF SMALL FARMS.

A single uncultivated acre, is a real physical evil in any state, and there can be no doubt that extensive tracts, which are now waste would have been reclaimed, and an incalculable addition been made to the produce and population of the country, if the system of large farms had not obtained among us. In a small farm each part is seen by the eye of its master, and has its due tillage.—The work of husbandry is chiefly performed by the farmer and his family. They spare no pains to cultivate that soil which assures their subsistence: and hence the glebe subdued and manured with assiduous care, makes a large return to that labor which is bestowed on its culture. A vast population springs up, and the land is covered with the dwellings of a multitude of cultivators, who find, each, in the produce of that small farm which he occupies, a decent and comfortable maintenance. It happens otherwise where farms are of a large extent. In a large farm many parts are overlooked or neglected, and a more negligent culture is bestowed by hired laborers more remiss and less interested in the crop. The great farmer is placed in a state of higher plenty, and his dwelling, his furniture, and his table express his opulence; but while he enjoys this affluence, and while luxury gains admission among a rank of men to whose condition it is ill suited, the populousness of the country decays, the number of industrious cultivators is diminished, and extreme indigence is too often found in the dwellings of those who inhabit around. This practice has for some time prevailed in England; the number of small farms is diminished, and the proprietors of estates have in many instances adopted the plan of laying many small farms into one large farm. Agriculture has not profited by this alteration. The glebe stinted in its tillage, where a single master grasps a whole domain, has not yielded a more abundant harvest, and the markets less amply provided in some important articles, miss that supply which they were accustomed to draw from small farms. The population of the country has fallen. While the mansion of the great farmer has risen more ostentatiously, those numerous tenements that were scattered through the fields, or that encircled the village green, have disappeared, and the "deserted village" has furnished a theme for the poet's song. The ancient tenant finding no occupation in the fields where he has spent his youth, forsakes his native shore and seeks with his family another climate where his industry is better rewarded, or where he serves to swell the ranks of sickness, poverty, and death. This is not all. Let it be remembered that a firm and independent spirit is better nourished among that rank of men, by whom small farms are cultivated. They are actuated by the same spirit. They derive courage from their numbers and resources. The bold animate the timid. The resolute confirm the wavering. They take their measures in common: they prosecute them with vigor, and their simple virtues will give its character to a country, and uphold in the hour of danger, the rights and liberties of all.—*Taunton Advocate.*

LORD CHATHAM'S GARDENS.

Lord Chatham's taste in laying out his grounds was exquisite. One scene in the gardens of South Lodge, in Enfield Chase (which was designed by him,) that of the Temple of Pan and accompani-

ments, is mentioned by Mr Whately, in his "Observations on Modern Gardening," as one of the happiest efforts of well-directed and appropriate decoration.

It is pleasing to reflect that Mr Pitt did not relinquish his fondness for these elegant recreations, even when the weightiest affairs of the nation were committed to his care. "He was once, whilst he was Secretary of State, directing the improvements in the grounds of a friend near London, and was called to that city sooner than he expected, upon the arrival of some important despatches. On receiving the summons in the evening, he immediately sallied out, attended by all the servants he could get together, with lanterns, and planted stakes in the different places for which he intended clumps and trees."

Mr Haley, in the Memoirs lately published, mentions the admirable taste of Lord Chatham in selecting points of picturesque scenery.—*Seward's Anecdotes.*

MR COBBETT'S INDIAN CORN.

Mr Cobbett has addressed another letter to the *Morning Herald*, on the subject of his Indian Corn. After stating that he was about to begin harvesting, he says—"But Sir, the subject on which I am about to give you information, at present, is, the capacity, or fitness, of the flour of this corn for the making of bread. You had the goodness to insert an account which I gave you of bread having been made from this corn, mixed with wheat, and sold by Mr Sapsford, baker, corner of Queen Anne and Wimpole streets. In consequence of that publication, Mr Sapsford has had many applications for the bread: and I have received information from him that he intends to continue to make it for sale. He has sent me a loaf of one-third corn-flour, and two thirds wheat-flour. This bread is very good, and very light.—He also informs me that Indian corn flour will, weight for weight, make more bread than the best of wheat flour." He adds—"There will be, no doubt, various opinions as regards the goodness of the bread. We differ in our tastes; some will like this sort of bread better, and others not so well as bread made wholly of wheat. I have sold the one pound loaves at 2½d. each, which is about a half-penny in the pound less than that made of the best wheat flour." [A gentleman of this city has sent Mr Cobbett a box of our early Sioux corn, which ripening earlier than the common sort, may answer better in the climate of England.]

FARMING.

Agriculture, as practised in modern times, and particularly in this country, embraces more objects, and requires the exercise of as much and great variety of talents, as constant and persevering attention as any pursuit in life.

A good farmer must have a good garden, a good orchard, good stock, good grain, good meadows, good enclosures, and must know how to keep them so. He must watch the state of the market, and above all he must see if others have excelled him in their agricultural pursuits, and endeavor, if possible, to ascertain the cause, and avail himself of their better skill.

The preservation of manure, its application, the effect of irrigation, of draining, assorting, preserving and preparing seed the manner and times of ploughing, dragging, and sowing, taking care of

stock, &c. &c. ought, all, to undergo his inspection, and be subject to his remarks, in their progress of effecting the object intended.

Intercourse with those engaged in the same pursuits is to be sought in every way that can afford beneficial results. The interchange of civilities, occupied in comparing our views on subjects which engross our daily attention and conduce to our support and comfort in the social family circle, are to be encouraged, but those that embrace whole communities are to receive our open countenance and zealous support.

Professional men, merchants, mechanics, and even laborers of various descriptions, have their societies, their celebrations, and exhibitions. Agriculturists have occasionally adopted the same system, and experience has pronounced its benefits.—*Watertown (N. Y.) Register.*

Doctor Mease, of this city, has just presented the public with observations on the Penitentiary System and Penal Code of Pennsylvania, with suggestions for their improvement.

A part of the pamphlet, which consists of nearly 100 pages, has been previously before the public; but as the subject upon which it treats is one of particular interest at the present time, the philanthropic author has, we think, been politic in offering anew his ideas, with such additions as the circumstances of the time, and his own extensive inquiries might suggest. The Doctor recommends solitary confinement, without labor, and a complete fulfilment of the sentence of the court. He also renews his suggestion of transporting criminals, under such modifications as the abuses and errors of the English customs intimate. The work appears in good time, and will undoubtedly be read with interest.—*U. S. Gazette.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JAN. 9, 1829.

MOODY'S PATENT PORTABLE OVEN.

This apparatus with Willis's improvement, is one of the most useful articles of kitchen furniture, which we have seen, or we believe has been introduced since the clay furnace came in vogue. Indeed, that very convenient implement can hardly be considered as complete without Moody's and Willis's addition; as one of the most important applications of heat for culinary purposes cannot be made without the Oven.

It consists of a cylindrical oven of tin or sheet iron, placed over a common clay furnace, with proper and simple means for retaining and regulating heat, in such a manner that bread, meat, pies, beans, peas, &c. &c. &c. may be baked with as little trouble, and almost as speedily as water can be boiled in a common tea-kettle.

We shall not attempt to describe this apparatus, because five minutes inspection will be better than half an hour's description; and those who wish to reap any advantage from a really good thing, may call at the Agricultural Warehouse, No. 52 North Market street, and they will see one of the best which has been seen since the days of Tubal Cain, or the time, when man first became, as Burke said, a Cooking Animal."

THE HARE.

Among the animals, which are rarely domesticated or raised in this country, although they

compose a part of the stock of cultivators in some parts of the world, may be numbered the Hare, *lepus timidus*. Mr Loudon says of this creature "if taken young it may be tamed and domesticated, and has occasionally been nursed by a cat.—Sonnini, the naturalist, and Cowper, the poet, had hares in a complete state of domestication. As the fur of this animal is of a greater value for hat-making than that of the rabbit, it would be a very desirable circumstance if it could be substituted for that animal in warrens. Its flesh would certainly be deemed preferable, and in general it is a large animal. It lives on the same sort of food as the rabbit, produces, generally, three young ones at a time, and breeds, at least, three times a year. It is not improbable that in some situations, where the soil is dry and poor, a hare warren or park might be found to answer; the price in the metropolis being never less than ten times that of rabbits.

"There is a hare warren near Banstead Downs. It contains about three acres of ground; 200 brace are usually kept in it. They are fed in the summer on clover, rape, &c. and in the winter on hay. The warren is surrounded by a brick wall about ten feet high, with openings at regular distances, within which are wire gratings on hinges: these give way to the hares, when they enter the warren; and they are so constructed as to immediately close after them, and so prevent their escape."

Dr Willch says "The hare is distinguishable from all other animals of its tribe by the ears being tipped with black, and longer than the head; the hind legs being half as long as the body, and the tail short.

"The fur of the hare forms an important article in the manufacture of hats, and vast quantities of hare's skins are for this purpose brought [into Great Britain] from Russia and Siberia.—This is the chief use, which we make of them, but in some parts of the continent the fur is spun and woven into a kind of cloth."

The rabbit in a wild state is not uncommon in the woodlands of New England, but we believe the hare has never been found in our forests.—Might it not be well to import a few brace of hares, and either raise them in warrens, or other proper habitations for those animals, or suffer them to run wild in pine plains, or shrub-oak barrens, which are the most proper pastures for hares as well as rabbits? English writers say that rabbits are more profitable stock than sheep, and hares more valuable than rabbits. Our waters should be stocked with the best sorts of fishes, and our woods with the most valuable wild animals.

An objection to raising hares and rabbits may exist in their propensity to injure young fruit trees by gnawing the bark from their stems. This, however, we believe they will not do, unless urged by hunger, as they prefer other food. Sheep will do the same in a similar case, and there is no animal domesticated, which may not, in some cases, commit depredations on the crops, or by other means prove injurious to the property of a farmer.

PRESERVATION OF WOOD LOTS.

Wood should be felled or cut down between the months of November and March. This circumstance renders it better fire wood, and, some say, more durable timber. And wood which is cut, when the sap is down, or in the roots, is most

apt to send forth sprouts or suckers, and thus renew its growth.

In applying the axe to a wood lot, which the owner would wish to perpetuate by a series of reproductions, the best method is to cut down every tree as far as you proceed. This will give the sprouts from the stumps, and other young trees the advantages of a free circulation of the air, and a fair exposure to the sun. But if some of the large trees are left, the shoots which spring up from the stumps of the others will languish beneath their shade.

That part of a wood lot, which has been cut over should be carefully fenced from cattle; which will otherwise destroy the young shoots by browsing on them. Care should also be taken to break off a part of the shoots around the stumps, leaving only two or three of the most thrifty. By such management, a wood lot might last for centuries and be a source of great profit and utility.

TRANSPLANTING FRUIT TREES.

How to set out Fruit Trees on a light soil. Dig a hole sufficiently large to prevent the roots of the tree, which is to be transplanted, from being doubled, or placed in an unnatural position, and to give room for the young shoots to extend themselves. Place about the roots of each tree, together with the mould, about half a bushel of small stones, the size of a common apple, or somewhat less, which will give stability to the soil, and prevent the roots from being loosened by the winds, which are so prevalent in our climate.

Another mode of transplanting fruit trees is thus described by Loudon: "Planting by mudding in is a German practice in planting fruit trees, particularly suitable to the dry sandy soils of that country, and sometimes adopted in similar situations in this country. The pit being dug out, the mould in its bottom is watered and stirred so as to form a mass of mud about half the depth of the pit; the tree is then inserted, and its roots worked up and down in the mud, so as to spread them as much as possible through it. More mud, previously prepared, is poured in till the pit is full, which is then covered with dry earth, raised round the stem, but hollowed in the middle, so as to form a basin round its stem, and finally covered with litter, and if a standard, it is fastened to a stake to protect it from winds. Dick, a scientific German author, assures his readers that trees planted in this way in spring, thrive better in cold situations than those planted in the ordinary way in the preceding autumn. He found it also particularly useful in the case of planting fruit trees in pots. Portey, alluding to this mode, says, "Planting in a puddle occasions the soil speedily to firm, not only too hard for the roots of the plant to spread, but also, so far as perfectly to exclude water." [This, however, we believe would not take place in a light sandy soil.]

"Planting by fixing with water is an excellent variety of the last species. It has been successfully practiced by Portey, and is thus described by him:—The hole being made, and the tree placed in it in the usual manner, the root is then slightly covered with the finer parts of the soil; the tree being at the same time shaken, as is common, to settle the earth among its roots. Water is then applied by a common garden watering pot, by pouring it upon the soil with some force, in order to wash it close to and among the roots of the plant. But this can only be done effectually by elevating the pot as high in the hands as it can be conveniently used, after first taking off the nose.

It will be obvious that for such purpose a large pan, with a wide spout is to be preferred. The hole is then filled up with the remainder of the soil, and that again consolidated with water as before, which usually finishes the business. The foot is never applied, except in the case of bad roots, which sometimes occasion the plants to be left a little leaning. In such cases the application of the foot slightly, once or twice, after the soil has become somewhat firm, (which generally happens in less than an hour,) sets the tree upright, and so firm as to need no staking.

A paper "*On the Management of Orchards*," written by the Hon. John Wells, and originally published in the Massachusetts Agricultural Repository, states two successful experiments in planting trees in situations not naturally favorable to their growth. The writer states that, "It is more easy than is generally supposed to overcome many natural disadvantages, and an orchard may be brought forward and made productive in a few years, in a situation (when wished) not so favorable. To show this, two cases will be mentioned, which have been attended with good success.

"In the one, a low piece of strong stoney land was taken. As it was rather flat, it was ploughed in strips, or dug in spaces about four feet square. As it was necessary to plough a furrow between each row, the mode of ploughing in strips was found the best, as by turning the furrow towards the tree the land was better drained. Besides raising the ground a little from the surrounding soil, half a buck load of loam was added to raise the ground on which the tree was set. After this was done, the strips or squares, as the case might be, were appropriated to the culture of potatoes and garden vegetables. In a few places only the trees failed from the insufficiency of the drain. But by opening the drain, and raising the ground by half a buck load of loam, I found on setting out a new tree, it flourished equally with the rest. This orchard now in eight years is a most valuable one, and most of the trees would give half a barrel of apples.

"From this and other circumstances, which have fallen within my observation, it appears that lowland, if strong and well drained, will give a fine orchard, and probably sooner than any other.

"The next effort was made under totally opposite circumstances. The object was to have an orchard on a particular spot, where the soil was thin and light upon a plain or flat. The holes were dug four feet over. The two upper strata of black and yellow loam were placed beside the tree. After this, about ten inches in depth of the gravelly or poorer earth was taken out and carted off; and a horse-cart load of stones upset in the hole; upon these, a part of the upper stratum, or some dirt from the side of the road, was scattered, so as to fill up the interstices, since which the spots near the trees have been cultivated by planting four hills of potatoes round each tree. The result has been tolerably favorable with all. But the trees having the stones at the roots have exceedingly outstripped the others."

A writer in the New York Daily Advertiser, declares from his own experience, that a strong tea, made of wood soot, drank freely, cold, is an unfailing remedy for Dyspepsia.

A Mr Lawton, of Newport, Rhode Island, has invented a new kind of temples, a pair of which are now in operation at T. Buffum & Co's Cotton

Mill, in Northbridge, Mass. and are found to answer a much better purpose, with no labor at all than old fashioned wooden temples now in general use.

We give the annexed paragraph as we find it in the Baltimore American. Much anxiety will naturally be felt to learn something further of the plan and construction of a car affording the amazing advantage represented, and it would give us pleasure to be able to enlighten our readers upon the subject. Forty tons is a large load for a horse, and any road or car which allows him to exert that power, will be an invention surpassing that of the steam engine.—*Penn. Gazette.*

From the moment of the commencement of the Baltimore and Ohio Rail Road, we were strongly inclined to the opinion that the inventive genius of our countrymen would never be contented to follow the beaten track pursued in similar works, on the other side of the Atlantic. Accordingly, we have already had occasion to notice several new and valuable improvements in the construction of railways and rail road carriages; and, within the last month, the meritorious invention of our esteemed townsman, Dr Wm Howard.—We have now to speak of another invention of a railway car, the model of which has just been submitted to the directors of the Baltimore and Ohio Rail Road Company, by the inventor, Mr Ross Winans, of New Jersey, and Mr J. L. Sullivan, civil engineer. The car is very simple in its construction, and seems so admirably to answer its intended purpose as to leave nothing to be desired on the score of facility of transportation.—Such, at all events, appears to be the opinion entertained of it by a number of gentlemen who witnessed its exhibition on Saturday. The model is capable of carrying 400 pounds weight. The effect of its operation under the disadvantage of an imperfect railway, was five and a half times greater than is usual on the rail roads in England. A half pound weight led over a pulley, which weighed 100 pounds. In England it is considered that one pound is the power requisite for drawing a load of 200 pounds. In the present instance, one pound to 1141 pounds was the ratio of the power to the load; and it is expected that on a large scale, a still greater advantage will be gained.—With this car a horse will be able to draw upwards of 40 tons, instead of 8½ tons, by the ordinary mode. The car has also other properties which we understand have a tendency to lessen the expense of the unavoidable curves of a rail-road. The model will remain in this city for some days, so that all who feel a desire to examine it, may have an opportunity of doing so. It will probably be removed to the Exchange in the course of to-day.

EFFECTS OF IVY ON TREES.

It appears to be a vulgar prejudice that ivy kills the trees it clings to. If it rooted itself, as is erroneously supposed, in their bark, and fed upon their juices, it might merit the accusation of a destroyer; but it derives its nourishment wholly from the ground, where it is rooted; and the supposed roots are only tendrils or holdfasts to enable it to climb. The opinion of its injuring trees seems to have arisen, (and very naturally too,) from the fact it prefers to climb up a dead or dying branch, and will not attach itself to very young wood at all. Mr Repton, the landscape gardener, gives numerous

facts to show that trees overrun with ivy, so far from being injured by it, grow most luxuriantly. Evelyn says, that when the ivy is stripped from trees, they are often killed by cold in the ensuing winter.—*American Farmer.*

CONTEMPLATED HORTICULTURAL SOCIETY.

We fully concur in opinion with the writer of the following able article, from a respected correspondent, that a Society for the promotion of skilful and scientific Horticulture, established in Boston, would greatly subserve the interests of the community, as well as furnish avenues to laudable distinction, and pure and praiseworthy enjoyment to the members of such an institution.—A number of persons associated for a desirable object, may furnish an aggregate of mind and means, which is much more effective for beneficial purposes than would be the isolated efforts of the same individuals. A HORTICULTURAL SOCIETY might introduce new and useful plants from various quarters of the globe; import valuable and expensive publications, as well as form a Repository for new and useful Implements, which would be beyond the powers of more numerous and wealthy persons to accomplish without acting in concert.—*Editor.*

TO THE EDITOR OF THE NEW ENGLAND FARMER.

The influence that has been so generally diffused throughout our state, by the institution of Agricultural Societies, is felt and acknowledged to be of immense importance to the interests of the cultivator, as well as to the consumers of the surplus produce of his labors. Whatever has a tendency to promote this honorable, and useful, and independent branch, of domestic industry, should be fostered and regarded.

It is equally gratifying to perceive that there is an excellent horticultural spirit awakened in our community, and which is not confined to the citizens of the metropolis, but pervades most of the neighboring towns and villages. We have witnessed with much pleasure, the increasing interest, and ardent efforts of our citizens in this peaceful, and healthful employment, and seen its visible effects, not only in the process of cultivation, but in its maturity. Our stalls and our fruit-shops have been abundantly supplied the past season, with better, and greater varieties of fine fruits, than heretofore.

The invalid must be grateful to those who thus administer to his enjoyments. The healthy will not be unmindful of the pleasure afforded, by the display of the rich dessert, with which his table is crowned. And the public will view with complacent regard, the attention bestowed upon this branch of the "American System," which needs no public act of doubtful expediency, to insure its protection.

It cannot be expected that in our northern climate, we should produce even by induring assiduity, or extensive outlay, all those fine varieties of fruit, which are yielded spontaneously, or with comparatively little labor, in some sections of our highly favored country. Under all discouragements, however, it must be admitted, that much has been achieved, and under the continued auspices of Heaven, and our native industry and perseverance, we may continue freely to enjoy the healthy, and invigorating pleasures of the cultivator, and share the bounties a benevolent Providence awards to the labors of man.

Who then among us is to give the impulse to more extensive and active exertions? To those who have been the modern pioneers in the resuscitation of this primitive employment of a portion of our race, who have labored with the mind and the hands so industriously and efficiently in the vineyard, we must look for countenance and instruction, for the enlargement and improvement of the system so successfully commenced, and so ardently and patriotically pursued, by several of our distinguished fellow-citizens.

We have been led to a consideration of this subject at the present time for the purpose of calling the attention of experienced and practical horticulturists, towards the founding of a Society for the promotion of that useful employment, of extending its blessings, and increasing the efforts of those who feel an interest in such pursuits.

The citizens of Massachusetts have never been backward in promoting any object of public utility, and it is believed that all that is now wanting to give an impulse to the plan here suggested, is to present the subject to the consideration of your readers.

New York, Philadelphia, and some other of our sister cities, have preceded us in the good work. Let us go and do likewise.

Z. C. Jr.

Dorchester, January 7.

LONDON HORTICULTURAL SOCIETY.

This important Society which has done so much to give Horticulture its present high standing, in Europe, now contains between *four and five thousand* members, embracing all classes of the community, from the King, who is its Patron, and subscribed £500 for the promotion of its important objects, down to the daily laborer, who has distinguished himself by a knowledge of horticulture. Its associates and correspondents are dispersed through every country of the globe, the Indies, and some upon the remotest islands of the sea, who are constantly transmitting seeds, scions, plants, and articles of intelligence to the parent Society in London. Their Transactions are regularly published, and are replete with information for horticulturists, and to society in general. Among its list of members in the United States, are Messrs JOHN LOWELL and S. G. PERKINS, of Boston—BURL, of Albany—PRINCE, of Long Island—COX, of New Jersey—Dr HOSACK, of New York—MR DICK, of Philadelphia—MR THOMAS, of Cayuga County, N. Y.—and Messrs FLOY, WILSON, and HOGG, of New York City. The late Gov. CLAXTON was an active corresponding member.

Large Pear.—At a late meeting of the Royal Horticultural Society of Paris, a gigantic pear was exhibited, of the following dimensions: circumference 15 inches; height 9 inches, and weight one pound seven ounces.

From the American Farmer.

SHEPHERD'S DOGS.

FROM GENERAL LAFAYETTE.

Extract to the Editor of the American Farmer, dated LA GRANGE, August 9, 1828.

MY DEAR SIR—The session of the Chambre des Deputes is at an end, and I am returned to La Grange, where I hope soon to reunite the greatest part of the family, including our three boys for the time of the vacation.

You will have received a letter, inclosing one

from my colleague, M. Girod de l'Ain, Judge of the Royal Court of Paris, and a member of the association of Naz, the celebrated flock for the fineness of merino wool. I believe it will have attracted your attention. The enclosed small book has been lately published; as the southern parts of the United States are well calculated for the cultivation of the silk worm, and the middle states also, I think the information therein contained may be of some use in the American Farmer. You have mentioned to me the Pyrennean breed of dogs; I have procured two puppies, one of them, as both are males, I shall send when more fit to bear the voyage."

[The puppies arrived safely, and are of immense size; one remains in Maryland, and one is for Mr Dickinson, of Steubenville, Ohio. They are of the breed which is used to destroy wolves and sheep-killing dogs. The treatise is entitled, "Manual pour l'Education des Vers a Soie, et la Culture du Murier, par J. M. REDARES, du Gard." If on examination it should be found to contain information that may appear new and useful, in addition to what we have published, and shall publish in our next, we shall insert it as soon as convenient.]

Silk Exports.—A correspondent predicts that this country will export the raw material of this article, within a few years after our attention is well directed to its culture, to an extent somewhat comparative with that of cotton. France, he says, imports one third of the raw material she manufactures, and she would become our best customer.—*National Intelligencer.*

The Season.—The Georgia Journal of the 15th December says, thus far, the thermometer has indicated summer heat, within a degree or two. Although the same remark will not apply to our latitude, yet we believe the oldest inhabitants have seldom seen so mild and open a winter; for all the purposes of out-door business the weather is as fine almost as in common in October; not an inch of snow has fallen.

The Penobscot was closed by ice the 18th inst.—*Newburyport Herald.*

Blisters Feet.—The following mode of cure, was communicated to Capt. Cochrane, and which he says he never found to fail:—It is simply to rub the feet at going to bed, with spirits mixed with tallow dropped from a lighted candle into the palm of the hand. On the following morning no blisters exist: the spirits seemed to possess the healing power, the tallow serving only to keep the skin soft and pliant. The soles of the feet, ankles, and insteps, should be rubbed well; and even where no blisters exist, the application may be usefully made as a preventative. Salt and water is a good substitute—and while on this head, I would recommend foot travellers never to wear right and left shoes; it is bad economy, and indeed serves to cramp the feet; and such I felt to be the case.—*Cochran's Pedestrian Tour.*

[From Ussenden's New American Gardener.]

JANUARY.

Throughout New England the temperature of the climate is such as to exclude the cultivator from performing most of the operations of tillage or horticulture from about the first of December to the latter part of March, or the beginning of April. The seeds of knowledge may, however, be sown

in winter, and the horticulturist may cultivate his mind when his soil is bound in frozen fetters.

Provide a sufficient quantity of bean-poles, and pea-roads, which you may preserve in a corner of your wood-house, or other place suitable for your purpose. Many people, who neglect to procure these implements in season, are induced, by the hurry of business, to permit their peas and beans to trail on the ground, in which situation they will not produce, especially the tall growing sorts, one third part so many as if they were properly supported by poles and rods. The length of your pea-roads should be in proportion to the sorts of peas for which you intend them. The same kinds of rods, which the tall-growing peas require, will answer for the generality of running kidney beans. The Lima beans will need strong poles, from eight to nine feet high. You may now make preparation for forcing cucumbers, melons, cabbages, radishes, lettuces, cauliflowers, &c.

BRITISH GRASSES.

The late Mr Curtis had squares of live turf sent him from all parts of the empire—particularly from pastures famous for their richness, and these he cultivated with care, for the purpose of comparison, and discovering the sorts of grasses, upon which the rich quality of the pastures, whence they were taken, depended. A comparative view of our British grasses of a similar kind may be seen, we are informed, at the nursery of Messrs. Cornack and Sinclair, New Cross, near Deptford—a field being appropriated for the purpose of growing patches of all the agricultural grasses. From the high character of one of the partners, Mr Sinclair, author of "the Hortus Gramineus Wolurnensis," in this particular line, this grass-field must be a very interesting sight to agriculturists and graziers, as well as to botanists.

TRANSPLANTING EVERGREENS.

The unfading verdure of the resinous trees forms a pleasant relief to the eye amid the desolate fields and snow-crowned hills of winter. These beautiful inmates of the northern forests, are peculiarly intractable to the skill of cultivation. The spruce and the fir, when removed from the cold and bleak solitudes where they best love to fix their roots and send up their tall pyramids of green, to a more genial situation, wither and perish. These beautiful and stately plants are desirable as the ornaments of the garden or the groves of cultivated scenery. The English books recommend that they be removed in the depth of winter with frozen masses of earth around their roots, to holes dug for their reception during the preceding autumn. By this simple process, it is said, they may be transplanted without injury, and flourish in their freshness as if still clinging to the rock or rising in the waste.—*National Regis.*

VALUABLE RECIPE.

In the Memoirs of Count de Segur, (Vol. I. p. 168,) there is the following anecdote: "My mother (the Countess de Segur,) being asked by Voltaire respecting her health, told him that the most painful feelings she had, arose from the decay of her stomach and the difficulty of finding any kind of aliment that it could bear. Voltaire, by way of conversation assured her that he was once nearly for a year in the same state, and believed to be incurable; but that, nevertheless, a very simple remedy had restored him. It consisted in taking no other nourishment than yolk of eggs, beaten up

with flour of potatoes and water." Though this circumstance took place as far back as about fifteen years ago, and respected so extraordinary a personage as Voltaire, it is astonishing how little it is known, and how rarely the remedy has been practised. Its efficacy, however, in cases of debility, cannot be questioned, and the following is the mode of preparing the valuable article of food, as recommended by Sir John Sinclair's Recipe.—Beat up an egg in a bowl, and then add six table spoonfuls of cold water, mixing the whole well together; then add two table spoonfuls of the farina of potatoes, mixing it with the liquor of the bowl. Then pour in as much boiling water as will convert the whole into jelly, and mix it well. It may be taken either alone or with the addition of a little milk, and moist or best sugar, not only for breakfast, but in cases of great stomachic debility, or in consumptive disorders, at the other meals. The dish is light, easily digested, extremely wholesome and nourishing. Bread or biscuit may be taken with it as the stomach gets stronger.

Singular effects of Light and Darkness—A plant, which is not uncommon in India, the *Cotyledon calycina* changes its properties very remarkably, according to the period of the day and night. Upon the whole, the plant may be said to possess an herbaceous taste, but in the morning it is as much, if not more acid, than sorrel, probably from its imbibing oxygen during the night. As the light continues to act upon it, the oxygen appears to be disengaged as it loses its acidity, and about noon becomes nearly tasteless. Towards evening it becomes bitterish, and sour again in the morning. This plant, we are told, may be seen at Loddige's Nursery, at Hackney, and in some other collections in England.

Mr Brown of Glasgow, has published a paper on what he calls the disorder of the spinal nerves, which, though not uncommon, particularly among females and persons of feeble conformation, seems to have hitherto been overlooked, unexplained, or confounded with rheumatism, &c. The disorder usually manifests itself by a sort of bruised gnawing pain, or rather a relaxed weariedness, in some part of the chest, sometimes over the stomach, and sometimes in one of the sides, &c. In such cases the seat of the complaint may be traced to the spine, by passing a sponge dipped in hot water down the back, when the part affected will be found to be tender. Here Dr Brown applies leeches, or a small blister, according to circumstances, and recommends being in a horizontal position. This disorder is not uncommon among literary people.—*Glasgow Medical Journal.*

A writer in Poulson's American, Philadelphia, recommends that the currency of the country be regulated: all the foreign coins called in and passed through the mint; clipped money declared uncurrent, &c. These suggestions are worthy of consideration.

Nearly 20,000 loads of wood have been transported on the Delaware and Hudson Canal, principally to the New York market.

Fruit.—The art of improving the quality of fruits by crossing the various sorts, is said to have been unknown until nearly the close of the last century, when it was first attempted in Belgium.—*London pa.*

A steer, of the short horned Durham breed, three years old in May last, was slaughtered a few weeks since, by Mr Edmund Brownell, of Little Compton, R. I. which weighed 1195 pounds.

The last number of the North American Review, contains articles on the following subjects: The Decline of Poetry—Scandinavian Mythology, Poetry, and History—Austin's Life of Gerry—Biography of a German Carbonarist—Flint's Geography and History of the Western States—Living's Life of Columbus—The Epistle to the Hebrews—Hayti—The Baltimore and Ohio Rail Road—Heeren's Historical Works—Simon Bolivar—Saxe Weimar's Travels—Quarterly List of New Publications.—Published quarterly, at \$5 per annum, by Frederick T. Gray, Washington Street, Boston, and G. & C. Carvill, New York.

We shall next week commence the publication of some remarks on Rail Roads.

Rockingham Agricultural Society.

The Directors of the R. A. Society, are hereby notified that their adjourned meeting will be held at Col. Burley's Hotel in Exeter, on Wednesday, the 14th day of Jan. current at 3 o'clock, P. M. S. T. GILMAN, Rec. Sec'y.
Jan. 9.
